SAMARA, a government of south-eastern Russia, on the left bank of the lower Volga, bounded on the north by Kazan, on the west by Simbirsk and Saratoff, on the east by Ufa and Orenburg, and on the south by Astrakhan, the Kirghiz Steppes, and the territory of the Ural Cossacks. The area is 58,320 square miles, and the population in 1882 was 2,224,093. A line drawn eastwards from the great bend of the Volga—the Samarskaya Luka—would divide the province into two parts, differing in orographical character. In the north flat hills and plateaus, deeply intersected by rivers, cover the surface. Some of these are spurs of the Urals, the others are continuations of the flat swelling which traverses middle Russia from the Carpathians to the Urals and compels the Volga to make its characteristic bend before entering the Aral-Caspian lowlands. The Samara Hills, on the right bank of the river Samara, the Kinel Hills, the Falcon (Sokodin) Hills, to the north of the Buzutuk, the Sok Hills, with the Tsareff Kurgan at the junction of the Sok with the Volga, and the Zheguleff "Mountains" on the Volga opposite Samara, are some many names given to separate elevations or parts of plateaus between the deep-cut river valleys. In their highest parts they rise about 1000 feet above the sea, while the level of the Volga at Samara is but 43 feet, and the broad valleys of the Volga affluents sink to a correspondingly low level. South of the Samarskaya Luka the country assumes the characters of a low and flat steppe, recently emerged from the great Post-Pliocene Aral-Caspian basin. Only two ranges of gentle swellings, spurs of the Obshchii Syrt, enter the south-east corner of the province.

The geology of Samara is not yet fully known. Carboniferous limestones (Upper I.) occupy large tracts in the north-east and east. When approaching the Volga the zechstein appears in wide islands surrounded by the (probably Triassic) variegated sands and sands. Some Jurassic deposits are mentioned along the Samarskaya Luka. Cretaceous deposits, which cover large tracts on the right bank of the Volga, appear on the left bank only in the south-east of Samara. Older Tertiary deposits appear also in the very south of Samara, while Pliocene limestones and sandy clays, which cover the Obshchii Syrt and Ust-Urt, protrude north as a narrow strip, reaching the bend of the Volga. The Glacial boulder-clay of middle Russia does not extend as far south-east as Samara, and the Post-Glacial deposits, not yet fully investigated, are represented by loess, black earth, and lacustrine formations. It is now established that during Post-Glacial times the Aral-Caspian was extended in a wide gulf occupying the broad depression of the Volga as far north as the Samarskaya Luka, Caspian mussels having been traced as far as Samara. The soil is on the whole very fertile. All the northern part of the government is covered with a thick sheet of black earth, this becomes thinner towards the south, clays—mostly fertile—appearing from beneath; salt dunes appear in the south-east.

Samara is inadequately watered, especially in the south. The Volga flows for 550 miles along its western border. Its tributaries the Great Tocharashan (320 miles), the Sok (195 miles), the Samara (340 miles), with its sub-tributaries, and the smaller tributaries the Motcha, Elen-Irgizh or Tchagay, and Little Irgizh are not navigable, partly on account of their shallowness, and partly because of water-mills. When the water is high, boats can

enter some of them to a distance of 15 to 30 miles. The Great Irgizh alone, which has an exceedingly winding course of 335 miles, is navigated to Kutchum, and rafts are floated from Nikolaevsk. The banks of both Kasanans are densely peopled. The Great and Little Ussai water south-eastern Samara and lose themselves in the Kamysh sands before reaching the Caspian. A few lakes and marshes occur in the river-valleys, and salt marshes in the south-east.

The whole of the region is rapidly drying up. The forests, which are disappearing, are extensive only in the north. Altogether they still cover an area of 3,043,000 acres, or 8 per cent. of the whole surface, prairie and grazing land occupies 11,495,000 acres, and only 4,198,000 acres are under sown.

The climate is one of extremes, especially in the steppes, where the depressing heat and drought of summer are followed in the winter by severe frosts, often accompanied by snow-storms. The average temperature at Samara (53° 11' N lat.) is only 39° 2 (January, 9° 3, July, 70° 4).

The population, which was only 1,388,500 in 1853, has almost doubled since then, mostly in consequence of immigration, it reached 2,224,093 in 1882, and must now (1886) be about 2,250,000. Only 139,830 of these live in towns, the remainder being distributed over 4,470 villages, which are often very large, no fewer than 150 ranging in population from 2000 to 6000. The Great Russians, who have immigrated in compact masses, now constitute 65 per cent. of the population, the Little Russians, who were settled by the Government about the salt lakes, number about 30,000, and the White Russians, also from the Government, may number about 15,000. A special feature of Samara is its population of German colonists, from Wurtemberg, Baden, Switzerland, and partly also from Holland and the Palatinate, whose immigration dates from the invitation of Catherine II. in 1762. Protected as they were by free and extensive grants of land, by exemption from military service, and by self-government, they have developed rich colonies of Catholics, Protestants, Unitarians, Anabaptists, Moravians, and Mennonites, most of which have adopted the Russian village-community system, slowly modified by the existence of a special capital reserved for the purchase of land for the increasing population. They now constitute 40 per cent. of the population of the district of Novo-Ussai, and 9 per cent. of that of Nikolaevsk, their aggregate number reaching 155,000. The Molokha and Bysya Moravians, now nearly quite Russianized, gathered in Samara during the reign of Peter I., when they obtained great immunities, and the bank of the Volga, they constitute about 10 per cent. of the population. Some 70,000 Tchuvashes and 1500 Voltyaks may be added to the above. The Turkish stem is represented by some 100,000 Tatars, 70,000 Bashkirs, and a few Kirghizes. Some baptized Kalmycks were settled in 1730 at Stavropol, and about 600 Adyghe Cossacks, settled at Novo-Ussai, may still be found there. All these varied elements, living in close juxtaposition, nevertheless continue to maintain their own ethnographical features, the Molavians alone have lost their ethnological individuality and rapidly undergo a modification of type as they adopt the life of Russian peasants. As regards religion, the great bulk of the population are Orthodox Greeks, the Nonconformists, who still retain their numerous and widely celebrated communities and monasteries on both the rivers Ussai, number several hundred thousands (officially 100,000), next come Mohammedans, 12 per cent., a variety of Protestants, 5 per cent., Roman Catholics, about 2 per cent.; and, lastly, some 4000 pagans.

The chief occupation is agriculture—summer wheat, rye, oats, millet, oil-yielding plants, and tobacco being the principal crops. Owing to its great fertility, Samara usually has a surplus of grain for export, varying from 1½ to 4 million quarters (exclusive of oats) annually. In 1883, which was an average year for summer wheat, but under the average for winter rye, the total crops were—wheat, 3,219,000 quarters, rye, 717,800, oats, 1,800,000, barley, 127,800, and other grains, 1,310,000. Notwithstanding this production, varying from 5,000,000 to 9,000,000 quarters of grain (exclusive of oats) for a population of only 2½ millions, Samara is periodically liable to famine to such an extent that men die by thousands of hunger-typhus, are compelled to send (as in 1870) to adjoining provinces to purchase orphans as food, or are forced to go by hundreds of thousands in search of employment on the Volga, while millions of quarters of corn are nevertheless exported. The population have no store of corn, or reserve capital for years of scarcity (there were in 1882 only 245,100 quarters of corn in the public granaries, and 503,022 roubles of capital for that purpose), and some 210,000 males have in all only 845,000 acres of arable and pasture land. But even this soil, although all taxed as arable, is often of such quality that only 60 to 55 per cent. of it is under crops, while the peasants are compelled to rent from two to ten and a half million acres for tillage from large proprietors. At present 5,549,000 acres, or about one-quarter of the total area of

¹ See the interesting work of M. Clausen on "Our Colonies" (Russian).

Samara, purchased from the crown or from the Bashkirs at nominal prices—very often a few copecks per acre—are in the hands of no more than 1704 persons. The aggregate taxes exacted from the peasants amounting to 5,782,870 roubles (1879), that is to say, from 8 to 10 roubles per male, they are, when account is taken of the advances received during scarcity, reduced to absolute destitution whenever the crops are short, so as to be compelled to sell their last horse and cow. In 1880 the arrears reached 7,000,000 roubles, to which must be added about 8,000,000 roubles of advances, and in 1882, out of the 1,186,646 roubles proposed to be levied by the zemstvos, 378,648 remained in arrears. The general impoverishment may be judged from the death rate, which for several years has ranged from 46 to 48 per thousand. In 1879 61,488 families were compelled to abandon their homes and disperse throughout Russia in search of employment, while 100,000 families were left wholly destitute of cattle in 1880. Notwithstanding an increase of population by nearly one-third during the last twenty years the numbers of sheep and cattle decreased by about one-half from 1863 to 1882.

The manufactures of Samara are unimportant, the aggregate production (chiefly from tanneries, flour-mills, tallow-melting houses, and distilleries) in 1882 reaching only 7,671,000 roubles (£767,100). Petty trades, especially the weaving of woollen cloth, are making progress in the south. The culture of oil-yielding plants is developed in several districts, as is also that of tobacco (10,690 acres, yielding 101,980 cwts. in 1884). Trade is very active—corn, tallow, potash, salt, and some woollen cloth being exported, the imports of raw cotton from Central Asia by the Orenburg railway to be added to the interior of Russia. The increasing trade. The aggregate value of merchandise shipped on the Volga and its tributaries within the government reached 27,025,000 roubles in 1882, while 9,100,000 cwts of merchandise were carried in both directions on the Orenburg railway. The chief loading places are Samara, Stavropol, Bataikova, and Pokrovsk on the Volga, Stara-Mansk on the Maina, and Ekaterininsk on the Bezenchuk.

The government is divided into seven districts, the chief towns of which, with population as estimated in 1879, are—Samara (89,400 inhabitants), Bugulma (18,000), Bugurustan (18,000), Buzhuk (10,500), Nikolaevsk (9,800), Novo-Uzeli (9700), and Stavropol (4265). Serghievsk (1000) also has municipal institutions, its mineral waters are becoming more and more frequented. Pokrovskaya Stoboda (20,000), Ekaterinenstadt, Gushitsa, and Alexandrovskaya, each with more than 5000 inhabitants, the leading place of Bataikova (2500), and several others, although still but villages, have more important character than the above towns.

The territory now occupied by Samara was until last century the abode of nomads. The Bulgarians who occupied it until the 18th century were followed by Mongols of the Golden Horde. The Russians penetrated thus far in the 16th century, after the defeat of the principalities of Kazan and Astrakhan. To secure communication between these two cities, the fort of Samara was erected in 1586, as well as Samoitof, Tsaritsyn, and the first line of Russian forts, which extended from Byeti-Yai to the neighbourhood of Menzelinsk near the Kama. A few settlers began to gather under its protection. In 1670 it was taken by the insurgent leader Stenka Razin, whose name is still remembered in the province. In 1782 the line of forts was removed a little farther east, so as to include Krasnyi Yar and parts of what is now the district of Bugurustan. The Russian colonists also advanced eastwards as the forts were pushed forward and increased in number. The southern part of the territory, however, remained still exposed to the raids of the nomads. In 1762 Catherine II invited foreigners, especially Germans, and Nonconformists who had left Russia, to settle within the newly-annexed territory. Emigrants from various parts of Germany responded to the call, as also did the Raskolniks, whose communities on the Ighiz soon became the centre of a formidable insurrection of the peasantry which broke out in 1775 under Pugacheff and was supported by the Kalmycks and the Bashkirs. After the insurrection, in 1787, a new line of forts from Uzei to the Volga and the Urals was erected to protect the southern part of the territory. At the end of the 18th century Samara became an important centre for trade. As soon as the southern part of the territory became quiet, great numbers of Great and Little Russians began to settle there—the latter by order of Government for the transport of salt obtained in the salt lakes. In the first half of the present century the region was rapidly colonized. In 1847–50 the Government introduced about 120 Polish families, in 1857–59 Mennonites from Dantzig also founded settlements, and in 1859 a few Crossians were brought hither by Government, while an influx of Great Russian peasants continued and still goes on. The territory of Samara remained long under Kazan, or Astrakhan, or Simbirsk and Orenburg. The separate government dates from 1861. (P. A. K.)

SAMARA, capital of the above government, is situated on the slopes of the left bank of the Volga, 743 miles to the south-east of Moscow, at the mouth of the Samara

and opposite the hills of Zheguleff. It is one of the most important towns of the lower Volga for its trade, and its importance cannot fail to increase as the railway to Central Asia advances eastwards. Its population rose from 24,500 in 1869 to 63,400 in 1879. Samara is built mostly of wood, and large spaces remain vacant on both sides of its broad unpaved streets. Its few public buildings are insignificant. A number of the inhabitants support themselves by agriculture and gardening, for which they rent large areas in the vicinity of the town. The remainder are engaged at the harbour, one of the most important on the Volga. Three fairs are held annually, with aggregate returns exceeding 2,000,000 roubles. Samara is becoming more and more a resort for consumptives on account of its koumiss establishments (see vol. xvi pp. 305–6).

SAMARCAND See SAMARAND

SAMARIA (Heb שֶׁמָרִיא, *Shéméríā*, LXX. Σαμαρεία, except in 1 Kings xiv. 24), the capital of Northern Israel from the time of Omri to the fall of the kingdom, which was consumed in the long siege of the royal city by Shalmaneser (2 Kings xvii. 5) and its capture by his successor Sargon (c. 721 B.C.). The choice of Samaria as his capital by the warlike and energetic prince to whom the kingdom of Ephraim mainly owed its greatness is easily understood. It stands in the very centre of Palestine and of the country of the dominating tribe of Joseph, and, built on a steep and almost isolated hill, with a long and spacious plateau for its summit, was naturally a position of much strength, commanding two of the most important roads—the great north and south road which passes immediately under the eastern wall, and the road from Shechem to the maritime plain which runs a little to the west of Omri's capital. The hill of Samaria is separated from the surrounding mountains (Amos iii. 9) by a rich and well-watered plain, from which it rises in successive terraces of fertile soil to a height of 400 or 500 feet. Only on the east a narrow saddle, some 200 feet beneath the plateau, runs across the plain towards the mountains, it is at this point that the traveller coming from Shechem now ascends the hill to the village of Sebastiya (now pronounced Sebastiya), which occupies only the extreme east of a terrace beneath the hill top, behind the crussing church of John the Baptist, which is the first thing that draws the eye as one approaches the town. The hill-top, the longer axis of which runs westward from the village, rises 1450 feet above the sea, and commands a superb view towards the Mediterranean, the mountains of Shechem, and Mount Hermon. The situation as a whole is far more beautiful than that of Jerusalem, though not so grand and wild. The line of the ancient walls has not been determined, the chief visible ruins being of the time of Herod, but, if they followed the natural lines of defence, the city may have been almost a mile in length from east to west.

The foundation of the new capital was speedily followed by the wars with Damascus, in which repeated ineffectual sieges by the Syrians proved the value of the stronghold, and even the Assyrians, as has been mentioned, reduced the place with difficulty. During part of the struggle with Damascus the kings of Israel often resided at Jezreel, which was nearer the seat of war, but Omri's city never lost its pre-eminence. While it stood, Samaria and not Jerusalem was the centre of Hebrew life, and the prophets sometimes speak of it as also the centre of corrupt Jehovah-worship and idolatry (Hos vi. 5, Mic i. 5, Isa x. 10). The

1 The first 6 in *Shéméríā* can hardly represent the old pronunciation. In 1 Kings xiv. 24, the name of the city is derived from that of Shehem, from whom Omri bought the site, and here LXX. seems to have originally had Σαμάρη or Σαμάρην (ὁδὸς ἔστι Σαμάρην), afterwards corrected to Σαμαρεία (as in Lagarde's edition of Lucan's text) from the Hebrew tradition (compare Field's *Heccepsa* on the passage). The Assyrian monuments have *Samarra*.

asha'a of Samaria, which was not removed by the house of Jehu, is mentioned in 2 Kings xiii 6, and Hos vii 5 seems to speak of calf-idols there, unless the prophet is already using the name of Samaria for the kingdom as a whole, as later writers often do. Ultimately, in the Greek period, the name of Samaria or Samaritis was applied to the whole tract of which it is the centre—the region between Judaea and Galilee, the country of the SAMARITANS (*q. v.*) and the New Testament uses Samaria in this sense. The city of Samaria was Hellenized by Alexander, who settled Macedonian colonists in it. It became a fortress and was twice taken by siege in the wars of the Diadochi (by Ptolemy I in 312 and by Demetrius Poliorcetes about 296). Under the Ptolemies Samaria was the head of a separate province, and it continued to be a strong city till John Hyrcanus took and utterly destroyed it after a year's siege (c. 110 *B. C.*, see *Jos. Ant.*, xiv 10, 2 *sq.*). Taken from the Jews by Pompey, Samaria was one of the ruined cities which Gabinius ordered to be restored (*Jos. Ant.*, xiv 5, 8), then given by Augustus to Herod the Great, it was refounded by him on a splendid scale probably in 27 *B. C.*, the autumn of which year, according to Schurer's calculations, is the probable epoch of the new city of Sebaste, as it was now called in honour of Augustus. Many remains of Herod's buildings, described by Josephus (*Ant.*, xiv 8, 8, *P.* i 21, 2), still remain, the most notable belong to a long colonnade just above the line of Herod's wall and those of the great temple of Caesar. The tombs of John the Baptist, Elisha, and Obadiah were visited at Samaria in the time of Jerome (see *ORADIAN*), and that of St John must have been shown there still earlier, for it was visited by Julian. The old crusading church, now a mosque, was built over the tomb of the Baptist, who is revealed as a prophet by the Moslems. A view and plan of the church, with details, are given in the *Survey of IV Pal (Alemania)*, vol. i p 211 *sq.*, where also there is a plan of the city. (W R S)

SAMARITANS This term, which primarily means "inhabitants of Samaria or the region of Samaria," is specially used, as in the New Testament and in Josephus, as the name of a peculiar religious community which had its headquarters in the Samaritan country, and is still represented by a few families (about 150 souls) at Nablus, the ancient Shechem. They regard themselves as Israelites, descendants of the ten tribes, and claim to possess the orthodox religion of Moses, accepting the Pentateuch and transmitting it in a text which for the most part has only microscopic variations from the Torah of the Jews. But they regard the Jewish temple and priesthood as schismatical, and declare that the true sanctuary of God's choice is not Zion but Mount Gerizim, overhanging Shechem (John iv 20), here they had a temple which was destroyed by John Hyrcanus about 128 *B. C.* (*Jos. Ant.*, xiii 9, 1), and on the top of the mountain they still celebrate the pass-over. The sanctity of this site they prove from their Pentateuch, reading Gerizim for Ebal in Deut xxvii 4. With this change the chapter of Deuteronomy can be interpreted with a little straining as a command to select Gerizim as the legitimate sanctuary (comp. ver 7), and accordingly in Exod xx and Deut v a commandment taken from Deut xxvii is inserted at the close of the decalogue. Thus on their reckoning the tenth commandment is the direction to build an altar and do sacrifice on Gerizim,—from which of course it follows that not only the temple of Zion but the earlier temple of Shiloh and the priesthood of Eli were schismatical. Such at least is the express statement of the later Samaritans; the older Samaritans, as they had no sacred books except the Pentateuch, probably ignored the whole history between Joshua and the captivity, and so escaped a great many difficulties. The contention that the Pentateuch is a law given by Moses for a community worshipping on Mount Gerizim is of course glaringly unhistorical. By the (unnamed) sanctuary of God's choice the Deuteronomist certainly designed the temple of Zion; and the priestly law, which is throughout based on the practice of the priests of Jerusalem before the captivity, was reduced to form after the exile, and was first published by Ezra as the law of the rebuilt temple of Zion. The Samaritans must therefore have derived their Pentateuch from the Jews after Ezra's reforms, *i. e.*, after 444 *B. C.* Before that time Samaritanism cannot have

existed in a form at all similar to that which we know, but there must have been a community ready to accept the Pentateuch. In point of fact the district of Mount Ephraim was not entirely stripped of its old Hebrew population by the Assyrian captivity, and the worship of Jehovah went on at the old shrines of Northern Israel side by side, or even intermixed, with the old heathenish rites of the new settlers whom the Assyrians brought to fill up the lands desolated by war. The account of the religious condition of the country given in 2 Kings xvii 24 *sq.* dwells only on the partial adoption of Jehovah-worship by the foreigners who had come into the land, but by no means implies that the foreigners constituted the whole population. Josiah extended his reforms beyond the limits of Judaea proper to Bethel and other Samaritan cities (2 Kings xxiii 19), and the narrative shows that at that date things were going on at the Northern sanctuaries much as they had done in the time of Amos and Hosea. To a considerable extent his efforts to make Jerusalem the sanctuary of Samaria as well as of Judaea must have been successful, for in Jer xli 5 we find fourscore men from Shechem, Shiloh, and Samaria making a pilgrimage to "the house of Jehovah," after the catastrophe of Zedekiah. And so it is not surprising to find that the people of this district came to Zeirubabel and Joshua after the restoration, claiming to be of the same religion with the Jews and asking to be associated with them in the rebuilding of the temple. Their overtures were rejected by the leaders of the new theocracy, who could not but fear the results of interfusion with so large a mass of men of mixed blood and very questionable orthodoxy, and so the Jehovah-worshippers of Samaria were thrown into the ranks of "the adversaries of Judah and Benjamin" (Ezra iv). Nevertheless, down to the time of Nehemiah, the breach was not absolute, but the expulsion from Jerusalem in 432 *B. C.* of a man of high-priestly family who had married a daughter of Sanballat made it so, and it is more than probable, as has been explained in *ISRAEL*, vol. xiii p 419, that this priest is the Manasseh of Josephus, who carried the Pentateuch to Shechem, and for whom the temple of Gerizim was built. For, though the story in Josephus (*Ant.*, xi 8) is falsely dated and mixed with fable, it agrees with Neh. xiii. in too many essential points to be wholly rejected, and supplies exactly what is wanted to explain the existence in Shechem of a community bitterly hostile to the Jews, and yet constituted in obedience to Ezra's Pentateuch.

When we consider what difficulties were met with in the introduction of Pentateuchal orthodoxy even at Jerusalem, the foundation of a community of the Law in the Samaritan country, among the mixed populations whom the Judean leaders did not venture to receive into fellowship, must appear a very remarkable exploit. The Samaritan religion was built on the Pentateuch alone; and the fact that they did not receive even those prophetic books and historical narratives which originated in Northern Israel (all which have been preserved to us only by the Jews) shows that, before they received the Pentateuch, their Jehovah-worship was a mere affair of traditional practice, uninspired by prophetic ideas and unsupported by written record of the great deeds of Jehovah in time past. It can hardly in any respect have risen above the level of the popular religion of North Israel as described and condemned by Hosea and Amos. In Judaea the duty of conformity to the Pentateuch was enforced by appeal to the prophets and to the history of the nation's sins and chastisements, and the acceptance of a vast and rigid body of ordinances was more easy because they came as the consolidation and logical development of a movement that had been in progress from the days of Isaiah. Among the Samaritans, on the other hand, the acceptance of the Pentateuch implied a tremendous

breach of continuity. They must indeed have felt that they had fallen behind the Jews in religious matters, and the opportunity of putting themselves on a par with them by securing a copy of the institutes of Moses and the services of a Judean priest would naturally be grasped at. But what is remarkable is that, having got the Pentateuch, they followed it with a fidelity as loyal and exact as the Jews themselves, save in the one matter of the change of the sanctuary. No concessions were made to heathenism or to the old lax Jehovah-worship, the text of the sacred book was transmitted with as much conscientiousness as was practised by Jewish scribes in the first centuries after Ezra,¹ and even from the unwilling witness of their enemies the Jews we can gather that they fulfilled all righteousness with scrupulous punctiliousness so far as the letter of the written law was concerned, though of course they did not share in the later developments of the oral law, and so were heretics in the eyes of the Pharisees.²

That it was possible to establish such a community on such a soil is a remarkable evidence that in that age the tendency to a legal religion was favoured by general causes, not confined to Judea alone, it must be remembered that elaborate hierocracies sprang up after the fall of the old nationalities in many parts of western Asia (comp. PRIEST, vol. xix p. 729). At the same time it must be remembered that, as Ezra could not have succeeded without Nehemiah, Manasseh had Sanballat's civil authority to back him. It is probable, too, that Josephus is right in assuming that he was strengthened by a considerable secession of Judeans, and it is not to be supposed that the "Samaritans" ever embraced anything like the whole population of the Samaritan country. Samaria itself was Hellenized in the time of Alexander, and in Ecclus. 1. 26 the foolish people that dwell at Shechem are distinguished from the inhabitants of the Samaritan hill-country in general.³ The Samaritans, like the Jews, thrived and multiplied under the discipline of the law, but at no time in their history do they appear to have had the political importance that would have accrued to so closely knit a religious body if it had held all the fertile Samaritan district.

Jews and Samaritans were separated by bitter jealousies and open feuds (Jos., *Ant.*, xii. 4, 1), but their internal development and external history ran closely parallel courses till the Jewish state took a new departure under the

¹ This appears especially by comparison of the Samaritan Pentateuch with the Septuagint. It is not of course to be wondered at that the Judean text is on the whole superior to the Samaritan, for the Samaritans had no opportunity of revising their text by Judean copies. The Samaritan character is an independent development of the old Hebrew writing as it was about the time when they first got the Pentateuch. This in itself is an indication that from the first their text ran a separate course, and that there was no opportunity of checking corruptions that had got into it by reference to different recensions. In Judea also there were important variations between MSS. down to the time of the Septuagint and even later, and many cases the Septuagint readings agree with the Samaritan Pentateuch, showing an affinity between the sources of these two texts. But ultimately the Jewish scribes were able to constitute or rather to select an authoritative text, and whether by good luck or by judgment the text they chose was on the whole one of a singularly good type. The Samaritans never had opportunity to do anything of this kind.

² Compare, for details and references, Nitz, *Fragmente of a Samaritan Targum*, p. 37 sq., 42 sq., and Schurer, *Gesch. des jüdischen Volkes*, p. 7. Josephus (*Ant.*, xi. 8, 7) says they received the Jews who were accused of ritual irregularities, but, as he adds that the fugitives professed that they were falsely accused, it is plain that even this partisan writer did not venture to represent them as indifferent to ritual orthodoxy. No doubt, in addition to the legal ordinances, the Samaritans retained some ancient traditional practices, as they certainly introduced some new observances. Their passover, for example, has some peculiar features, one of which, viz. the application of the sacrificial blood to the faces of the children, has an exact parallel in the old Arabic *al-iksha*. See the account of an eye-witness (Prof. Soan) in Badeker's *Palestine*.

³ So all Greek MSS. The old Latin substitutes *Monti Edom*, the Syriac has "Gebel," which may mean Ebal or the Edomite country.

Maccabees. The religious resemblance between the two bodies was increased by the adoption of the institution of the synagogue, and from the synagogue there certainly grew up a Samaritan theology and an exegetical tradition. The latter is embodied in the Samaritan Targum or Aramaic version of the Pentateuch, which in its present form is, according to Noldeke's investigations, not earlier than the fourth Christian century, but in general agrees with the readings of Origen's *ῥὸ Σαμαρειτικόν*. For the dogmatic views of the Samaritans our sources are all late, they embrace hymns and other books of little general interest, and mainly at least of mediæval origin. Like the Jews, too, the Samaritans had a haggada, indeed the Arabic books they still possess under the name of chronicles are almost entirely haggadic fable with very little admixture of true tradition. The recent date of all this literature seems to show that the old Samaritans had not nearly so vigorous an intellectual life as the Jews, though what life they had moved in similar lines; indeed, having no sacred book but the Pentateuch, and having passed through no such national revival as that of the Maccabees, they lacked two of the most potent influences that shaped the development of Judaism. On the other hand, they shared with the Jews the influence of a third great intellectual stimulus, that of Hellenism. Samaritans as well as Jews were carried to Egypt by Ptolemy Lagi, the rivalry of the two sects was continued in Alexandria (Jos., *Ant.*, xii. 1, 1), and Hellenized Samaritans wrote histories and epic poems in Greek with exactly the same patriotic mendacity which characterizes Jewish Hellenism. Of this, the oldest surviving Samaritan literature, some fragments have been preserved in the remains of Alexander Polyhistor.⁴

The troubles that fell on the Jews for their fidelity to the law, under Antiochus Epiphanes, were not escaped by the Samaritans (2 Mac. v. 23, vi. 2), the account in Josephus (*Ant.*, xii. 5, 5) which makes them voluntarily exchange their religion for the worship of the Grecoan Zeus is certainly a malignant falsehood.⁵

Under the Maccabees their relations with Judea became very bitter, and they were severely chastised by Hyrcanus, who destroyed their temple. Hostilities between the two nations recurred from time to time, and in the New Testament, in Josephus, and in Jewish tradition we see how deep-seated was their mutual abhorrence.⁶ But, with all this, the sects were too nearly alike not to have much in common. The Roman yoke galled both in the same way; the Samaritan false prophet whose movement Pilate put down with cruel slaughter (Jos., *Ant.*, xvii. 4, 1), and probably also Simon Magus and Dositheus (Orig., *Cont. Cels.*, i. p. 44), are parallel phenomena to the false Messiahs that arose among the Jews. The original views of the Samaritans were like those of the Sadducees, and they did not believe in a resurrection or a Messiah, but it was impossible for their faith to survive under the cruel pressure of foreign bondage without absorbing something from Jewish eschatology. And so too, in the struggle of the Jews with Vespasian, perhaps also in that with Hadrian, the Samaritans forgot their old feud, and took part against the Romans. They seem also to have shared in great measure in the subsequent dispersion, for in later times we hear of Samaritans and Samaritan synagogues not only in Egypt but in Rome, and in other parts of the empire.

⁴ See especially Frießlander, *Hellenistische Studien* (1875), p. 82 sq. An Egyptian-Samaritan fragment has also been suspected by Ewald to be imbedded in the *Sibylline*, xi. 330-244.

⁵ See Appel, *Questions de Religion Samaritanorum*, 1874, p. 37 sq. Josephus calls them Chthæans (from 2 Kings xvi. 30), and will not admit that they are of Hebrew blood at all; the Rabbins use the same name, but are not always so positive in calling them pure Gentiles. The groundless accusation of dove-worship (which makes their religion that of the Syrian Aphrodite) arose in post-Mishmic times.

The Christian emperors made hard edicts against them as well as the Jews, and at length excluded them from the public service. Under these circumstances they naturally came to be mainly traders and merchants' clerks, in Constantinople "a Samaritan" meant "a banker's clerk." In their old homes they still remained numerous enough to make a serious insurrection under Justinian (529 A.D.). Its suppression was followed by very stern decrees against the whole sect, and Europe heard little more of the Samaritans till, towards the close of the 16th century, Western scholars took an interest in the few congregations that still remained in the East, at Cairo and Damascus as well as at Nabulus. It was found that during the Middle Ages they had formed an Arabic literature of considerable size but of little intrinsic worth, and had continued faithfully to preserve their scriptures. Since then their numbers have been constantly on the wane, and they have almost lost their old learning, which was never very considerable.

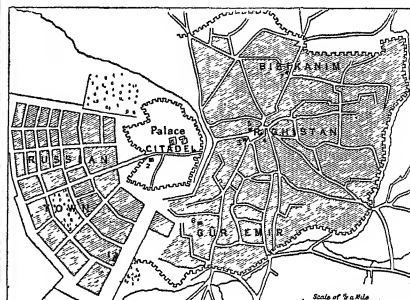

Samaritan Literature—Of this a full account is given, along with a sketch of Samaritan history, in the introduction to Nutt's *Fragment of a Samaritan Testament* (1874). The following list confines itself to what has been printed: (a) The Hebrew-Samaritan Pentateuch, &c., the Hebrew text in Samaritan recension and character, see Gesenius, *De Pent. Sam. origine*, &c. (1816). A list of variations from the Massoretic text is given by Petermann, *Hebr. Sam. nach der Aussprache der Samaritanen* (1868). (b) Targum, also in the Paris and London polyglots, but in very corrupt form. A critical edition of the whole is still lacking; the best text of part is that given by Nutt from a Bodleian MS. The dialect, apart from the corruptions of the text, differs little from other Palestinian Aramaic. (c) Aramaic having been supplanted in Palestine by Arabic, an Arabic version of the Pentateuch was made by Abi Saïd about 1100 A.D. The first three books have been edited by Kauten (1851-64). On this version, see especially the French *Acad. des Belles-Lettres*, vol. xlv. (d) The so-called Samaritan book of Joshua is an Arabic chronicle going down to Roman times, but of almost no historical use. It may date from the 13th century. Juynboll edited it in 1848 from a Leyden MS.; there are other MSS. in the British Museum and in Trinity College, Cambridge. (e) Another short chronicle, *El-Tolikh*, published by Neubauer in *Jour. As.* (1860), seems to have been written by a Jew, *Abd. ben Abd. Beth* (e) and (f) with some other sources were used by—(f) The Chronicle of Abulfath, written in 1856, and continued by later hands, edited by Vilmar (Götting, 1865). (g) A collection of hymns was published by Gesenius (*Carmena Samaritana*, 1824). Other liturgical pieces have been published by Haidenheim. (h) Specimens of Samaritan writings on Hebrew grammar were published by Noldeke in the *Göttinger Nachrichten* (1852).

For the Samaritans in general, see Nutt, *op. cit.*, Juynboll, *Comm. in Hist. Genes. Samar.*, Leyden, 1846. Appel, *De Reb. Samaritanorum sub imperio Romano pariter*. De Sacy published in the *Notes et Extraits*, vii (1811), all the correspondence of the Samaritans with European scholars, and other material about the modern Samaritans. For the modern Samaritans see also Petermann's *Rechen*, vol. i (1860). For Maimon's recension of the Samaritans, see De Sacy, *Rechen*, *op. cit.*, other liturgies in Nutt and very fully in Kauten's articles in *Herzog-Holt*, vol. viii. (W. R. S.)

SAMARKAND, a city of Central Asia, anciently *Marcanda*, the capital of Sogdiana, then the residence of the Sámánids, and subsequently the capital of Timur, is now chief town of the Zeráfshan district of the Russian dominions. It lies in a richly cultivated region, 185 miles south-west of Tashkend, and 146 miles east of Bokhara, in 39° 39' N. lat. and 67° 17' E. long., 2150 feet above the sea, in the valley of the Zeráfshan, at the point where it issues from the extreme western spur of the Tian-Shan before entering the steppes of Bokhara. The Zeráfshan now flows about three or four miles to the north of the city, supplying its extensive gardens with water.

Marcanda, a great city, whose walls had a compass of 90 stadia, was destroyed by Alexander the Great. It reappears as Samarkand at the time of the conquests of the Arabs, when it was finally reduced by Kotabe ibn Moslim in 93 A.H. (711-712 A.D.). Under the Sámánids it became a brilliant seat of Arabian civilization. Its schools, its savants, were widely renowned; it was so populous that, when besieged by Jenghiz Khan in 1219, it is reported to

have been defended by an army of 110,000 men. Destroyed and pillaged by the great conqueror, its population was reduced to one-quarter of what it had been, but it still reckoned 25,000 families within its walls. The great conqueror Timur made it his residence, and the inhab-

Plan of Samarkand. 1, Governor's house, 2, Burying-place of Russian soldiers who fell in the defence of 1863, 3, College of Ulug-beg, 4, College of Shih-dar, 5, College of Tilla-kau, 6, Grave of Timur, 7, Grave of Timur's wives.

itants rose to 150,000. The magnificent buildings of the epoch of the successors of Timur, which still remain, testify to its former wealth. But new invaders again reduced it to ruin, so that at the beginning of last century it is reported to have been almost without inhabitants. It fell under Chinese dominion, and subsequently under that of the emir of Bokhara, suffering again and again from wars which were fought for it and around it. But no follower of Islam enters it without feeling that he is on holy ground, although the venerated mosques and beautiful colleges of Samarkand are falling into ruins, its high influence as a seat of learning has vanished, and its very soil is profaned by infidels. It was not without a struggle that the Mohammedans permitted the Russians to take possession of their holy city, and, while other cities of Central Asia submitted almost without striking a blow, Samarkand revolted in 1868, the Russian garrison shut up in the citadel being rescued only by the timely arrival of a corps despatched from Tashkend.

The present city, which is but a wreck of its former self, is quadrangular in shape and is enclosed by a low wall 9 miles long. The citadel rises in the west, and to the westward of this again the Russians have laid out their new town, with broad streets and boulevards radiating from the citadel, while a pretty public garden, carefully irrigated, occupies the centre.

The central part of Samarkand is the Raghistan—a square limited by the three *madrasahs* (colleges) of Ulug-beg, Shih-dar, and Tilla-kau, in its architectural symmetry and beauty this is rivalled only by some of the squares of Italian cities. Though differing in detail, the great lines of the three colleges are the same. An immense doorway decorates the front of each of these large quadrilateral buildings. A high and deep-roofed porch, whose summit almost reaches the top of the lofty facade, is flanked on each side by a broad quadrilateral pillar of the same height, subdivided into three sections, each of which has its own style of decoration. Two fine columns, profusely decorated, in turn flank these broad pillars. On each side of the high doorway are two lower archways connecting it with two elegant towers, narrowing towards their tops and slightly inclined. The whole of the facade and also the interior courts are profusely decorated with enamelled bricks, whose colours—blue, green, pink, or golden, but chiefly turquoise-blue—are wrought into the most fascinating designs, in striking harmony with the whole and with each part of the building. In the recess of the deep doorway is the wide door, with proportions of remarkable elegance, and above it are the broad decorations filling up the upper part of the arch. Over the interior are bulbous or melon-like domes, perhaps too heavy for the facade. The cool and shady

courts are surrounded by three stories of small rooms, each having only one opening—the door. The majestic buildings are now merely the dwellings of mollahs, who live on the revenues of the Wakf lands at Katty-kurgan.

The college of Shir-dar (built in 1691) takes its name from the two lions, or rather tigers, figured on the top of its doorway, which is richly decorated with green, blue, red, and white enamelled bricks. It is the most spacious of the three, and 128 mollahs inhabit its 64 apartments. The Tilla-kam ("dressed in gold"), built in 1618, has 66 rooms. But the most renowned of the three madrasahs is that of Ulug-beig, built in 1420 or 1434, by Timur, the grandson of the great conqueror. It is smaller than the others, but it was to its school of mathematics and astronomy that Samarkand owed its renown in the 15th century.

A winding street running north-east from the Raghistan leads to a much larger square having the college of Bibi-Khanyun on the west, the graves of Timur's wives on the south, and a clean bazaar on the east. The college was erected in 1888 by a Chinese wife of Timur, and is said to have once sheltered as many as a thousand students. It covers a large area, and has three mosques connected by a quadrangular building containing the students' refectory. The archway and towers of its facade are considered by Vambéry as a model for such buildings, and its decorations resist the destructive influences alike of time and of man. One of its mosques still raises its high bulb domes above the outer walls, which are falling into ruins, and now give accommodation to the cats and the bazaar of tadeins in cotton. The lofty ruins of the grave of Timur's wives are really good.

To the north, outside the walls of Samarkand, but close at hand, is the Hazreti Shah-Zindeh—the summer-palace of Timur, and near this is the grave of Shah-Zindeh, of, more precisely, Kotham ibn al-Abbas ibn 'Abd al-Mottalib, a famous companion of the Prophet. This was already a famous shrine in the 14th century (Ibn Batuta, in 52), it is believed that the saint still lives in the mosque, and will one day rise for the defence of his religion. The Hazreti Shah-Zindeh covers a wide area, a long terrace long by forty marble steps. A series of galleries and rooms leads to the hall containing the relics of the saint. The decoration of the interior halls is marvellous.

Another street running south-west from the Raghistan leads to the Gur-Emir—the grave of Timur. This consists of a chapel crowned with an elegant dome, enclosed by a wall and fronted by an archway. Time and earthquakes have greatly injured this fine building, one of the minarets is already in ruins. The interior consists of two spaces paved with white marble, the walls being covered with elegant turquoise arabesques and inscriptions in gold. The chief room is of great beauty, and its decorations, of a bolder style than the others, are in strict harmony with the impression it is designed to produce. A large pyramidal piece of jade broken into two covers the grave of Timur, which has by its side that of his teacher, Mir Said Berke, and those of several members of his family, all enclosed by a marble railing. A dark and narrow flight of steps leads down to the crypt, also ornamented with arabesques, where the graves are placed in the same order as in the upper hall.

The citadel is situated on the west of the city, upon a hill whose steep slopes render it one of the strongest in Central Asia. Its walls, 3000 yards in circuit and about 16 feet high, enclose a space of about 4 square miles. It contained the palace of the emir of Bokhara, a vulgar modern building now transformed into a hospital,—and the audience hall of Timur, a terrace long and broad, surrounded by a colonnade, and containing the *Khan-kash*, a grey stone 10 feet long, 4 feet broad, and 4 feet high, reported to have been brought from Brussa. On it Timur used to take his seat, surrounded by his numerous vassals, from it more recently the emirs of Bokhara also were wont to dispense their terrible justice.

Remains of former buildings—heaps of plain and enamelled bricks, among which Græco-Bactrian coins have been found—cover a wide area all around the present city to the west and south-west, and north. The name of Aphrosiab is usually given to these ruins, which extend for nearly three miles to the westward of the present Russian town, this suburb of Samarkand was enclosed by a wall, the ruins of which can be traced for seven or eight miles. Five miles to the south-west of Samarkand is the college Khodja Akbar, its flower ornamentation in enamelled brick is one of the most beautiful of Samarkand. Rye is now grown in its courtyard, its artistic ornamentation is now to ruin. To the north-north-east are the Toghpan-ata Hills, the chief of which has on its summit the grave of Dama Polvan. On the right bank of the Zerashkan stands the village of Dehbid, peopled by descendants of Mahkhdum Azam (died in 1542), who possess a beautiful *Khanka* (monastery), with pretty avenues of trees planted by Næz Divanbeghi in 1632. As for the famous Baghitchi-naran (the garden of plane trees), only the ruins of its palace now mark its former position, the trees have disappeared. Of the Græco-Armenian library said to have been brought to Samarkand by Timur no traces have been discovered, and Vambéry regards the whole legend as a fable invented by Armenians. Every trace of the renowned high school Kalinder-khanyun has also disappeared.

The present Moslem city is an intricate labyrinth of narrow winding streets, having on both sides clay walls concealing dirty court-yards and miserable houses. The population was estimated at 36,000 in 1879, it consists of Tajiks (Iranians) and Saks or Uzbeks. The Europeans numbered 5380. Some 800 Jews occupy a separate quarter, remarkable for its filth. Numbers of Arabs, Persians, Afghans, Hindus, Kipchaks, and Tangans (Gypsies) may be met with in the streets. The chief occupation of the inhabitants is gardening, the gardens beyond the walls are extensive and very well kept. There is also a certain amount of manufacturing industry, the workshops, which are small, are thus ornamented by M. Kostenko—for metallic wares, 12, for tallow and soap, 34, tinware, 30, pottery, 37, for various tissues, 246. Those for dyeing and the manufacture of harness, boots, and gold and silver wares are also numerous. The best harness, ornamented with turquoise, and the finer products of the goldsmith's art, are imported from Bokhara or Afghanistan. The products of local potteries are very fine.

The bazaars of Samarkand, the chief of which is in the centre of the town, close by the Raghistan, are more animated and kept with a greater cleanliness than those of Tashkent or Namangan. The trade carried on by local or Bokhara merchants is very brisk, the chief items being cotton, silk, wheat and rice, horses, asses, fruits, and outlay. Wheat, rice, and silk are exported chiefly to Bokhara, cotton to Russia, via Tashkent. Silk-wares and excellent fruits are imported from Shahr Syabs, and rock-salt from Hissar. (P. A. K.)

SAMBALPUR, or SUMBULPOOR, a British district in the chief-commissionership of the Central Provinces of India, between 21° 2' and 21° 57' N lat and between 83° 16' and 84° 21' E long. Exclusive of attached native states by which it is surrounded, Sambalpur contains an area of 4521 square miles. Including the native states, it is bounded on the north by Chutia Nagpur, on the east and south by Cuttack district, Bengal, and on the west by the Bilaspur and Raipur districts. The Mahanadi, which is the only important river in the district, flows through it, dividing it into unequal parts. The greater portion of Sambalpur is an undulating plain, with ranges of rugged hills running in every direction, the largest of which is the Barâ Pahâr, a mountain chain covering an area of 350 square miles, and attaining at Dubirgarh a height of 2287 feet above the plain. The Mahanadi affords means of water communication for 90 miles, its principal tributaries in Sambalpur are the Ib, Keldi, and Jhûrâ. To the west of the Mahanadi the district is well cultivated. The soil of the district is generally light and sandy. It is occupied for the greater part by crystalline metamorphic rocks; but part of the north-west corner is composed of sandstone, limestone, and shale. Gold dust and diamonds have been found near Hirakshud or Diamond Island, at the junction of the Ib and Mahanadi. The climate of Sambalpur is considered very unhealthy, its average temperature is 79°, and its average annual rainfall is 58½ inches.

The census of 1881 disclosed a population of 693,499 (346,549 males and 346,950 females). Hindus numbered 682,747 and Mohammedans 2968. The only town in the district with a population exceeding 5000 is SAMBALPUR, the administrative headquarters, which, with 19,989 inhabitants, situated in 21° 27' 10" N and 83° 44' E, on the land contributed 211,388. It has much improved since 1864, when a cart could only with great difficulty pass through the main street. Of the total area of the district 1126 square miles are cultivated, and of the portion lying waste 888 are cultivable. Rice forms the staple crop, other products are food grains, oil-seeds, cotton, and sugar-cane. The manufactures are few and of no great value. The gross revenue in 1883-84 was £22,446, of which the land contributed £11,388.

Sambalpur passed to the British in 1849, who immediately adopted a system of exaction and confiscation by raising the revenue assessments one-fourth and resuming the land grants, religious and others. Great dissatisfaction was the consequence, and the Brahmans, who form a numerous and powerful community, made an appeal, but obtained no redress. In 1854 a second land settlement again raised the assessments everywhere one-fourth. This system of exaction produced its natural results. On the outbreak of the mutiny in 1857 a general rising of the chiefs took place, and it was not until the final arrest of Surandra Sâ, a chief who for some years had been the cause of great disturbances, in 1864 that tranquillity was restored, since then the district has enjoyed profound peace.

SAMNITES, a people of ancient Italy, whose name figures conspicuously in the early history of Rome. They occupied an extensive tract in the centre of the peninsula, which derived from them the name of Samnium. The territory thus designated was a wholly inland district, bounded on the north by the Marsi, Peligni, and Frentani, who separated them from the Adriatic, on the east by Apulia, on the south by Lucania, and on the west by Campania and Latium. But the Samnites were from an early period a numerous and powerful nation, and formed rather a confederacy of tribes than a single people. Hence the name is sometimes used in a wider sense, in a more limited sense,—the Hirpini, especially, who occupied the southernmost portion of their territory, being sometimes included amongst them, sometimes distinguished from them. But according to the usual acceptation of the term—excluding the Frentani, who, though unquestionably of Samnite origin, were not usually regarded as belonging to the Samnite nation—they consisted of three principal tribes—the Caraceni in the north, the Pentri, who may be termed the Samnites proper, in the centre, and the Hirpini in the south. Almost the whole of Samnium, as thus defined, was a rugged, mountainous country, and, though the Apennines do not in this part of their range attain to so great an elevation as farther north, they form irregular masses and groups, filling up almost the whole territory, and in great part covered with extensive forests. On the side of Campania alone the valley of the Volturnus was richer and more fertile, and opened a natural access from the south into the northern regions of Samnium, while the Calor, a tributary of the same river, which flows from the east past Benevento, afforded in all ages a similar route into the upland districts of the Hirpini. Between the two, occupying the centre of the Pentrian territory and the very heart of Samnium, was the great mountain mass now known as the Monte Matese, of which the highest summit attains to an elevation of 6600 feet, and which must in all ages have been a region presenting peculiar difficulties of access.

All ancient writers agree in representing the Samnites as a people of Sabine origin, who migrated at an early period to the region of which we find them in the occupation when they first appear in history. The period of this emigration is wholly unknown, but, if we can trust the tradition reported by Strabo, that it was the result of a vow to send forth the produce of a "sacred spring" (see SABINES), it could hardly have been in the first instance very numerous, and it is probable that the invaders established themselves in the midst of an Oscan population, with whom they gradually coalesced. It is certain that no very long interval elapsed before the Samnites in their turn found themselves exceeding the resources of their barren and rugged territory, and extending their dominion over the more fertile and accessible regions by which they were surrounded. The first of these movements was probably that by which they occupied the land of the Frentani, a fertile district along the shores of the Adriatic, between the northern part of Samnium and the sea. The Hirpini also were in the first instance almost certainly a later offshoot of the central Samnite people, though they continued always in such close connexion with them that they were generally reckoned as forming part of the Samnite confederacy, and almost uniformly took part with the more central tribes in their wars against Rome. The Frentani, on the contrary, generally either stood aloof from the contest or secured their own safety by an alliance with Rome.

To a later period belong the emigrations that gave rise to the two powerful nations of the Lucanians and Cam-

panians. At the time when the Greek colonies were established in southern Italy the native tribes that occupied the regions to the south of Samnium were the Oenotrians and other Pelagic races, and it was not till after the middle of the 5th century B.C. that the pressure of the Lucanians from the interior began to make itself felt in this quarter. From this time they gradually extended their power throughout the whole country to the Gulf of Tarentum and the Sicilian Straits. It was probably at a somewhat earlier period (about 440 to 420 B.C.) that they effected the conquest of the fertile country to the west, intervening between the mountain regions of Samnium and the sea. Here they found an Oscan population, with whom they seem to have speedily coalesced, and thus gave rise to the people known thenceforth as Campanians, or "inhabitants of the plain." But in this case also the new nationality thus constituted had no political connexion with the parent state, and retained its independent action both for peace and war. The first mention of the Samnites themselves in Roman history occurs in 354, when they concluded a treaty of alliance with the rising republic.

But it was not long before the course of events brought the two rival powers into collision. The Samnites, who appear to have been still actuated by aggressive tendencies, had attacked the Sidicini, a petty tribe to the north of Campania, and the latter, feeling unable to cope with so powerful an adversary, invoked the assistance of the Campanians. These, however, were in their turn attacked by the Samnites, and sustained so crushing a defeat, under the very walls of Capua, that they were compelled to implore the aid of Rome. Their request was granted, though not without hesitation, and thus began (in 343) the first of the long series of the Samnite Wars, which ultimately led to the establishment of the Roman domination over the whole of southern Italy. The events of these wars, which are related in all histories of Rome, can only be very briefly noticed here. The first contest was of short duration; and after two campaigns the Romans were willing not only to conclude peace with Samnium but to renew the previously existing alliance, to which the Samnites continued faithful throughout the great struggle which ensued between the Romans and the allied Campanians and Latins. The Second Samnite War was of a very different character. Both nations felt that it was a struggle for supremacy, and, instead of being brought to a close within three years, it lasted for more than twenty years (326-304), and was marked with considerable vicissitudes of fortune, among which the celebrated disaster of the Caudine Forks (321) stands most conspicuous. Nor was the struggle confined to the two leading powers, many of the neighbouring nations espousing the cause of the one side or the other, and often with fluctuating faith, in accordance with the varying fortunes of the war. The result, however, was on the whole favourable to the Roman arms, notwithstanding which they were willing to conclude peace in 304, on condition of the renewal of the previously existing alliance. This interval of tranquillity was of short duration, and little more than five years elapsed between the end of the Second Samnite War and the commencement of the Third (298). In this fresh contest they received a formidable auxiliary in a large body of Gauls, who had recently crossed the Alps, and, together with their countrymen the Senones, espoused the cause of the Samnites against Rome. Their combined forces were, however, defeated in the great battle of Sentinum (294), and after several successive campaigns the consul M. Curius Dentatus was able to boast of having put an end to the Samnite Wars (290), after they had lasted more than fifty years. It is true that a few

years later the Samnites again appear in arms, though rather as auxiliaries than principals, and the name of Fourth Samnite War is given by some historians to the memorable contest which, commenced in 282 by the Lucanians, assumed a wholly different aspect when Pyrrhus, king of Epirus, appeared in Italy as their auxiliary. But the power of the Samnites was evidently broken, and after the final defeat of Pyrrhus they appear to have offered little resistance. Their final submission was made in 272, and according to the usual Roman policy was secured by the establishment in their territory of the two important colonies of *Æsernia* and *Beneventum*.

During the Second Punic War, Samnium became the frequent theatre of hostilities. The Hirpini were among the first of the Italian tribes to declare in favour of Hannibal after the battle of Cannæ (216), but their example was not followed by the more powerful tribe of the *Pentini*, and when Hannibal was finally driven out of Central Italy the Samnites were speedily reconciled to submission. From this time we hear no more of them till the great outbreak of the Italian nations, commonly known as the Social War (90), in which they bore a prominent part. Two of the most distinguished of the Italian leaders, *C. Papus Matilius* and *C. Pontius Telesinus*, were of Samnite birth, and after the fall of Corfinium the Samnites town of *Bovianum* became the temporary capital of the revolt. Their systematic devastation of the whole country, with the avowed object of extirpating the very name of the Samnites, as the eternal enemies of Rome. To such an extent was this cruel purpose carried into effect that more than a hundred years afterwards, in the time of *Strabo*, the whole country is described as being in a state of utter desolation, flourishing towns being reduced to mere villages, while others had altogether ceased to exist. Nor does it appear probable that it ever recovered this severe blow, and, though an attempt was made to revive its prosperity by the establishment of Roman colonies within its limits, none of these attained to any importance. The name of Samnium was indeed retained as that of a distinct province throughout the greater part of the Roman empire, and is still found in *Cassiodorus*. But under the Lombard rule the whole of this part of Italy was included in the duchy of *Benevento*, which continued to subsist as an independent state long after the fall of the Lombard kingdom in the north of Italy. During the revolutions of the Middle Ages all trace of the name is lost, and, though it was revived in the last century as the official designation of a part of the region comprised within the ancient limits, previously known as the *Contado di Molise*, this was a mere piece of official pedantry, and the name has again disappeared from the modern maps of Italy.

Very few towns of importance existed at any period within the limits of Samnium, and many of those mentioned in history had disappeared in the continual wars with which the country was ravaged. The only names that are worthy of special notice are—*Aufidena*, in the north, the capital of the *Canaceni*, the ruins of which still exist, a few miles from *Castel di Sangro*; *Bovianum* (still called *Bojano*), the ancient capital of the *Pentini*, the heart of *Monte Matese*; *Seppinum* (*Seppino*), in the same neighbourhood; *Æsernia*, in the valley of the *Vulturinus*, still known as *Isesnia*; *Aquilona* (*Lacedogna*), in the land of the *Hirpini*, near the frontier of *Apulia*; and *Compsa* (*Conza*), on the borders of *Lucania*, near the sources of the *Aufidus*. *Beneventum* alone has retained its ancient consideration as well as name, an advantage which it derives from its position on the *Via Appia*, commanding the entrance to the mountain district of the *Hirpini* and the *Stellio-Ocean*.

The language of the Samnites, like that of their parents the *Sabines*, must clearly have been closely related to that of the *Oscans*, and the two nationalities appear to have amalgamated so readily that before the historical period there was probably little difference in this respect. Several of the most important of the inscriptions that remain to us have been found within the limits of the Samnite territory, and may be considered as *Stellio-Oscan* in their character, rather than purely *Oscan*. See for these the articles *ITALY* and *LATIN LANGUAGE*. (E. H. B.)

SAMOA. See **NAVIGATORS' ISLANDS**.

SAMOS, one of the principal and most fertile of the islands in the *Ægean Sea* that closely adjoin the mainland of *Asia Minor*, from which it is separated by a strait of

only about a mile in width. It is about 27 miles in length, by about 14 in its greatest breadth, and is occupied throughout the greater part of its extent by a range of mountains, of which the highest summit, near its western extremity, called *Mount Kerkis*, attains to the height of 4725 feet. This range is in fact a continuation of that of *Mount Mycale* on the mainland, of which the promontory of *Trogilum*, immediately opposite to the city of *Samos*, formed the extreme point. Various mythical legends were current to account for the original settlement of the city of *Samos*, and to connect its founders with the Greek heroic genealogies, but the earliest record that has any claim to an historical character is that of the occupation of the island by a colony of Ionian settlers under a leader named *Procles*, at the time of the great Ionian emigration to *Asia Minor* (about 1050 B.C.). In the historical period *Samos* figures as a purely Ionic city, and was one of the most influential members of the Ionic confederacy. In the five centuries that intervened from its first settlement to the reign of *Polycrates*, *Samos* had rapidly attained to a great height of power and prosperity, had founded colonies at *Penthus* and other places on the *Propontis*, as well as at *Nagidus* and *Celenderis* in *Cilicia*, and possessed a powerful navy, including, according to *Thucydides* (i. 13), the first triremes that ever were constructed. It was a *Samian* named *Coleus* also who was the first Greek that ventured to penetrate between the *Pillars of Hercules* into the ocean beyond, and brought back a vast amount of wealth from these previously unknown regions (*Herod.* iv. 152).

Samos was doubtless protected by its insular position from conquest by the Persian general *Harpagus*, nor did it follow the example of the two other great islands of *Chios* and *Lesbos* by voluntary submission to the Persian monarch. On the contrary, it not only preserved its independence for a period of more than twenty years longer, but it was precisely in this interval that it rose to the highest pitch of power and prosperity under the enlightened and able, though tyrannical, government of the despot *POLYCRATES* (q.v.). Under his government *Samos* became "the first of all cities Hellenic or barbaric," and was adorned with three of the greatest public works that had ever been executed by Greeks—an aqueduct tunneled through a mountain for a length of 7 stadia, a mole of more than 2 stadia in length for the protection of the harbour, and a temple (that of *Hera*) exceeding all others in size. How far these great works belong to the time of *Polycrates* cannot be determined with certainty; but there is little doubt that they were enlarged and completed, if not commenced, under his government. He was also the first to lay claim to the sovereignty of the *Ægean Sea*, or *thalassocracy*, which at that time there was none to dispute with him.

After the death of *Polycrates* (522 B.C.) *Samos* fell under the power of his brother *Syloson*, who established himself in the sovereignty with the support of a Persian army, but this revolution was not accomplished without a massacre of the citizens, which must have given a heavy blow to the prosperity of the island. Henceforth it continued to be tributary to Persia till the great battle of *Mycale* (480), which not only freed the *Samians* from the Persian yoke, but became the beginning of a fresh era of great prosperity, during which they, like the neighbouring *Chians* and *Lesbians*, were admitted as members of the *Athenian confederacy*, on free and equal terms, without payment of tribute. An abrupt termination was, however, put to this state of things in 439, when, the *Samians* having given offence to the *Athenians*, their city was besieged and taken by *Percles*, who compelled them to raze their fortifications, to give up their ships of war, to furnish hostages, and to pay the expenses of the war. From

this time therefore Samos became a mere dependency of Athens, and continued in this subordinate condition throughout the Peloponnesian War, but after the victory of the Spartans at *Ægospotami*, the city was besieged and taken by Lysander (404), and as usual an oligarchy was set up under Spartan control. Other revolutions, however, quickly followed. The victory of Conon at Cnidus in 394 restored the democracy, but the peace of Antalcidas shortly afterwards (387) placed the island under the government of a Persian satrap, and thus exposed it to the attacks of the Athenians, who sent an expedition against it under Timotheus, one of their ablest generals, who after a siege of eleven months reduced the whole island and took the capital city. A large part of the inhabitants were expelled, and their place supplied by Athenian emigrants (366).

From this time we hear but little of Samos. It passed without resistance under the yoke of Alexander the Great, and retained a position of nominal autonomy under his successors, though practically dependent, sometimes on the kings of Egypt, sometimes on those of Syria. After the defeat of Antiochus the Great at the battle of Magnesia (190), it passed with the rest of Ionia to the kings of Pergamum, but, having in an evil hour espoused the cause of the pretender Aristonicus, it was deprived of its freedom, and was united with the Roman province of Asia (129). Henceforth it of course held only a subordinate position, but it seems to have always continued to be a flourishing and opulent city. We find it selected by Antony as the headquarters of his fleet, and the place where he spent his last winter with Cleopatra, and a few years later it became the winter quarters of Augustus (21–30), who in return restored its nominal freedom. Its autonomy, however, as in many other cases under the Roman empire, was of a very fluctuating and uncertain character, and after 70 A. D. it lapsed into the ordinary condition of a Roman provincial town. Its coins, however, attest its continued importance during more than two centuries, and it was even able to contest with Smyrna and Ephesus the proud title of the “first city of Ionia.” It still figures prominently in the description of the Byzantine empire by Constantine Porphyrogenitus, but little is known of it during the Middle Ages.

During the Greek War of Independence Samos bore a conspicuous part, and it was in the strife between the island and Mount Mycale that Canaris achieved one of his most celebrated exploits by setting fire to and blowing up a Turkish frigate, in the presence of the army that had been assembled for the invasion of the island, a success that led to the abandonment of the enterprise, and Samos held its own to the very end of the war. On the conclusion of peace the island was indeed again handed over to the Turks, but since 1835 has held an exceptionally advantageous position, being in fact self-governed, though tributary to the Turkish empire, and ruled by a Greek governor nominated by the Porte, who bears the title of “Prince of Samos,” but is supported and controlled by a Greek council and assembly. The prosperity of the island bears witness to the wisdom of this arrangement. It now contains a population of above 40,000 inhabitants, and its trade has rapidly increased. Its principal article of export is its wine, which was celebrated in ancient times, and still enjoys a high reputation in the Levant. It exports also silk, oil, saffron, and other dried fruits.

The ancient capital, which bore the name of the island, was situated on the south coast, directly opposite to the promontory of Mycale, the town itself adjoining the sea and having a large artificial port, the remains of which are still visible, as are the ancient walls that surrounded the summit of a hill which rises immediately above it, and now bears the name of *Asyrion*. This formed the acropolis of the ancient city, which in its flourishing times occupied a wide extent, covering the slopes of Mount *Ampelus* down to the shore. From thence a road led direct to the far-famed temple of *Hera* (*Juno*), which was situated close to the shore, where its site is still marked by a single column, but even that bereft of its capital. This miserable fragment, which has given to the neighbouring islandland the name of *Capo Colonna*, is all that remains of the temple that was extolled by Herodotus as the largest he had ever seen, and which vied in splendour as well as in celebrity with that of *Diana* at *Ephesus*. But, like the *Ephesian Artemis*, the goddess worshipped at Samos was really a very different divinity from the one that presided over *Argos* and other

purely Greek cities, and was unquestionably in the first instance a native Asiatic deity, who was identified, on what grounds we know not, with the *Hera* of the Olympic mythology. Her image, as we learn from coins, much resembled that of the *Ephesian* goddess, and was equally remote from any Greek conception of the beautiful and stately *Hera*. Though so little of the temple remains, the plan of it has been ascertained, and its dimensions found fully to verify the assertion of Herodotus, as compared with all other Greek temples existing in his time, though it was afterwards surpassed by the later temple at *Ephesus*.

The modern capital of the island was, until a recent period, at a place called *Khioa*, about two miles from the sea, and the same distance from the site of the ancient city, but since the change in the political condition of Samos the capital has been transferred to *Vathy*, situated at the head of a deep bay on the north coast, which has become the residence of the prince and the seat of government. Here a new town has grown up, well built and paved, with a convenient harbour, and already numbers a population of 6000.

Samos was celebrated in ancient times as the birth-place of *Pythagoras*, who, however, spent the greater part of his life at a distance from his native country. His name and figure are found on coins of the city of imperial date. It was also conspicuous in the history of art, having produced in early times a school of sculptors, commencing with *Rhæus* and *Theodorus*, who are said to have invented the art of casting statues in bronze, and to have introduced many other technical improvements. The architect *Rhæus* also, who built the temple of *Hera*, was a native of the island. At a later period Samos was noted for the manufacture of a particular kind of red earthenware so much valued by the Romans for domestic purposes that specimens of it generally occur wherever there are remains of Roman settlements.

All the particulars that are recorded concerning Samos in ancient times are collected by *Paucorla* (*Des Samosorum*, Berlin, 1822). A full description of the island, as it existed in his time, will be found in *Tournefort* (*Voyage du Levant*, 4to, Paris, 1717), and more recent accounts in the works of *Ross* (*Reisen auf den Griechischen Inseln*, vol. ii, Stuttgart, 1842) and *Gudim* (*Palmas et Samos*, Paris, 1866). (C. B.)

SAMOTHRACE was the ancient name of an island in the northern part of the *Ægean* Sea, nearly opposite to the mouth of the *Hebrus*, and lying north of *Imbros* and north-east of *Lemnos*. It is still called *Samothraki*, and though of small extent is, next to *Mount Athos*, by far the most important natural feature in this part of the *Ægean*, from its great elevation—the group of mountains which occupies almost the whole island rising to the height of 5240 feet. The highest summit, named by *Pliny* *Saeco*, is estimated by him at an elevation of 10 Roman miles. Its conspicuous character is attested by a well-known passage in the *Iliad* (xii. 12), where the poet represents *Poseidon* as taking post on this lofty summit to survey from thence the plan of *Troy* and the contest between the *Greeks* and the *Trojans*. This mountainous character and the absence of any tolerable harbour—*Pliny*, in enumerating the islands of the *Ægean*, calls it “importuosissima omnium”—prevented it from ever attaining to any political importance, but it enjoyed great celebrity from its connexion with the worship of the *CABIRI* (*q. v.*), a mysterious triad of divinities, concerning whose very little is really known, but who appear, like all the similar deities venerated in different parts of Greece, to have been a remnant of a previously existing *Pelagic* mythology, wholly distinct from that of the *Greeks*. *Herodotus* expressly tells us that the “orgies” which were celebrated at *Samothrace* were derived from the *Pelagians* (ii. 51). These mysteries, and the other sacred rites connected therewith, appear to have attracted a large number of visitors, and thus imparted to the island a degree of importance which it would not otherwise have attained. The only occasion on which its name is mentioned in history is during the expedition of *Xerxes* (B.C. 480), when the *Samothracians* sent a contingent to the Persian fleet, one ship of which bore a conspicuous part in the battle of *Salamis* (*Herod.*, viii. 90). But the island appears to have always enjoyed the advantage of autonomy, probably on account of its sacred character, and even in the time of *Pliny* it ranked as a free state. Such was still the reputation of its mysteries that *Germanicus* endeavoured to visit the island, but was driven off by adverse winds (*Tac.*, *Ann.*, ii. 54).

No modern traveller appears to have visited Samothrace till the year 1858, when it was fully explored by Conze, who published an account of it, as well as the larger neighbouring islands, in 1860. The ancient city, of which the ruins are called Paleopolis, was situated on the north side of the island close to the sea. Its site is clearly marked, and considerable remains still exist of the ancient walls, which were built in massive Cyclopean style, but no vestiges are found of temples or other public buildings. The modern village is on the hill above. The island is at the present day very poor and thinly peopled, and has scarcely any trade, but a considerable sponge fishery is carried on around its coasts by traders from Smyrna (Conze, *Reise auf den Inseln des Thälischen Meeres*, Hanover, 1860).

The similarity of name naturally led to the supposition that Samothrace was peopled by a colony from Samos in Ionia, and this is stated as an historical fact by some Greek writers, but is rejected by Strabo, who considers that in both cases the name was derived from the physical conformation of the islands, Samos being an old word for any lofty height (Strabo, x, 2, p. 457). The same characteristic is found in Cephalonia, which was also called Samos in the time of Homer.

SAMOYEDES, a Ural-Altaic stock, scattered in small groups over an immense area, from the Altai Mountains down the basins of the Obi and Yenisei, and along the shores of the Arctic Ocean from the mouth of the latter river to the White Sea. They may be subdivided into two main groups. (A) Those inhabiting the southern parts of the governments of Tomsk and Yeniseisk have been so much under Tatar influence as to be with difficulty separated from the Tartars, their sub-groups are the Kamasin Tartars, the Kabals, the Motors, the Beltsus, the Kargassas, and the Samoyedes of the middle Obi. (B) Those inhabiting the subarctic region form three separate sub-groups—(a) the Yuraks in the coast-region from the Yenisei to the White Sea, (b) the Tavgh Samoyedes, between the Yenisei and the Khatanga, (c) the Ostiak Samoyedes, intermingled with Ostiaks, to the south of the others, in the forest regions of Tobolsk and Yeniseisk. Their whole number may be estimated at from 20,000 to 25,000.

The proper place of the Samoyedes among the Ural-Altaians is very difficult to determine. As to their present name, signifying in its present Russian spelling "self-eaters," many ingenious theories have been advanced, but the current one, proposed by Schrenk, who derived the name "Samoyedes" from "Szyroadyey," or "raw-eaters," leaves much to be desired. Perhaps the etymology ought to be sought in quite another direction, namely, in the likeness to Suomi. The names assumed by the Samoyedes themselves are Hazovo and Nyanyaz. The Ostiaks know them under the names of Orghory, or Wolcho, both of which recall the Ugrians, the name of Hui is also in use among the Ostiaks, and that of Yau among the Yuraks.

The language now spoken by the Samoyedes is, like the Finnish languages, agglutinative, but in both lexicon and grammar it differs so widely from that of Prof. Ahlqvist that he does not regard the similarity as greater than, for instance, that between Swedish and Persian. Much remains to be done for the study of Samoyedic, but it may be regarded as the most remote cousin of the Ugrian. It is a sonorous speech, pleasant to the ear. No fewer than three separate dialects and a dozen sub-dialects are known in it.

The conclusions deducible from their anthropological features—apart from the general difficulty of arriving at safe conclusions on this ground alone, on account of the variability of the ethnological type under various conditions of life—are also rather indefinite. The Samoyedes are recognized as having the face more flattened than undoubtedly Finnish stocks, their eyes are narrower, then complexion and hair darker. Zuyeff describes them as like the Tungus, with flattened nose, thick lips, little beard, and black, hard hair. At first sight they may be mistaken for Ostiaks, especially on the Obi, but they are undoubtedly distinct. Coste considers them as a mixture of Ugrians with Mongolians, and M. Zograf as brachycephalic Mongolians. Quatrefages classes them, together with the Voguls, as two families of the Ugrian sub-branch, this last, together with the Sabms (Laponians), forming part of the Ugrian or Boreal branch of the yellow or Mongoloid race.

It is certain that formerly the Samoyedes occupied the Altai Mountains, whence they were driven northwards by Turco-Tatars—probably at the time of the rise of the empire of the Huns, that is, before the present era. Their further and later migration towards the north may be said to be going on still. Thus, the Kabals left the Sayan Mountains and took possession of the Abakan steppe (Miusninsk region), abandoned by the Kirghizes,

in the earlier years of last century, and in north eastern Russia the Zyrians are still driving the Samoyedes farther north, towards the Arctic coast. Since the researches of Schrenk it may be considered as settled that in historical times the Samoyedes were inhabitants of the so-called Ugiia in the Northern Urals, while it would result from M. Radloff's extensive researches that the numberless graves containing remains of the Bronze Period which are scattered throughout West Siberia, on the Altai, and on the Yenisei in the Miusninsk region, are relics of a nation which he considers as Ugo-Samoyedes. This nation, very numerous at that epoch,—which preceded the Iron-Period civilization of the Turco-Tatars,—were pretty well acquainted with mining, the remains of their mines, sometimes 50 feet deep, and of the furnaces where they melted copper, tin, and gold, are very numerous, then the weapons of a hard bronze, then pots (one of which weighs 75 lb), and then melted and polished bronze and golden decorations testify to a high development of artistic feeling and industrial skill, strangely contrasting with the low level reached by their eastern waie. They were not nomads, but husbandmen, and their irrigation canals are still to be seen. They kept horses (though in small numbers), sheep, and goats, but no traces of their rearing horned cattle have yet been found. The Turkish invasion of southern Siberia by the Tulaks, Khagases, and Ugiaks, which took place in the 5th century, drove them farther north and probably reduced most of them to slavery,—these slaves seeming to have taught mining to their masters.

At present they are disappearing, and have almost entirely lost their earlier civilization. M. Polyakoff quite rightly observes that the Samoyedes who now maintain themselves by hunting and fishing on the low Obi, partly mixed in the south with Ostiaks, recall the condition of the inhabitants of France and Germany at the epoch of the invasions. Clothed in skins, like the troglodytes of the Weser, they make use of the same implements in bone and stone, eat carnivorous animals—the wolf included—and cherish the same superstitions (of which those regarding the teeth of the bear are perhaps the most characteristic) as were current among the Stone-Period inhabitants of central Europe. Their heaps of reindeer horns and skulls—memorials of religious ceremonies—are exactly similar to those dating from the similar period of civilization in northern Germany. Their huts often resemble the well-known stone huts of the Esquimaux, their graves are mere boxes left in the tundra. The religion is fetishism mixed with Shamanism, the shaman (*udzy-ben*) being a representative of the great divinity, the Num. The Yalmal peninsula, where they live, is so great facilities for hunting is especially venerated by the Obi-Tavgh Samoyedes, and there they have one of their chief idols, Khes. They are more independent than the Ostiaks, less yielding in character, although as hospitable as their neighbors. Reduced almost to slavery by Russian merchants, and brought to the extreme of misery by the use of audent spirits, they are disappearing rapidly, small-pox completing the work of destruction. They still maintain the high standard of honesty mentioned by historical documents, and, while the Russians plunder even the stores of their shamans, the Samoyedes never will take anything left in the tundra or about the houses by their "civilized" neighbors. The Yurak Samoyedes are courageous and valiant, they offered armed resistance to the Russian invaders, and it is only since the beginning of the century that they have paid tribute. The exact number of the Ostiak Samoyedes is not known, the Tavgh Samoyedes may number about 1000, and the Yuraks, mixed with the former, are estimated at 6000 in Obdorsk (about 150 settled), 5000 in European Russia in the tundras of the Mezen, and about 850 in Yeniseisk.

Of the southern Samoyedes, who are completely Tartarized, the Belts (3070 in 1859) live by agriculture and cattle-breeding in the Abakan steppe. They profess Christianity, and speak a language closely resembling that of the Sagai Tatars. The Kabals, or Kolbals, can hardly be distinguished from the Miusninsk Tatars, and support themselves by farming and the manufacture of furs, that three of them stems are of Ostiak origin, the remainder being Samoyedic. The Kamassins, in the Kansk district of Yeniseisk, are either herdsmen or agriculturists. They speak the Samoyedic language, with an admixture of Tartar words, and some of them stems contain a large Tartar element. The very interesting nomadic tribe of Kargassas, in the Sayan Mountains, is quite disappearing, the few representatives of this formerly much more numerous stem are rapidly losing their anthropological features, their Turkish language, and their distinctive dress. The Motors are now little more than a memory. One portion of the tribe emigrated to China and was there exterminated, the remainder have disappeared among the Turko-Tatars and the Soyotes. The Samoyedes on the Obi in Tomsk may number about 7000, they have adopted the Russian manner of life, but have difficulty in carrying on agriculture, and are a poverty-stricken population with little prospect of holding their own.

SAMPIERDARENA (population in 1881, 19,501). See GENOA, vol. x p. 157.

SAMSON (Hebrew, *Shamshôn*), the great enemy of the Philistines, is reckoned as one of the judges of Israel in two editorial notes which belong to the chronological scheme of the book of Judges (xv 20, xvi 31), but his story itself, which is a self-contained narrative by a single hand (Jud xii 2-16, 31a), represents him not as a judge but as a popular hero of vast strength and sarcastic humour, who has indeed been consecrated from his birth as the deliverer of Israel, and is not unaware of his vocation, but who yet is inspired by no serious religious or patriotic purpose, and becomes the enemy of the Philistines only from personal motives of revenge, the one passion which is stronger in him than the love of women. In his life, and still more in his death, he inflicts great injury on the oppressors of Israel, but he is never the head of a national uprising against them, nor do the Israelites receive any real deliverance at his hands. The story of his exploits is plainly taken from the mouths of the people, and one is tempted to conjecture that originally his Nazarene vow was conceived simply as a vow of revenge, which is the meaning it would have in an Arab story. Our narrator, however, conceives his life as a sort of prelude to the work of Saul (xii 5), and bungs out its religious and national significance in this respect in the opening scene (ch xii), which is closely parallel to the story of Gideon, and in the tragic close (ch xvi.), while yet the character of Samson, who generally is quite forgetful of his mission, remains much as it had been shaped in rude popular tale in a circle which, like Samson himself, was but dimly conscious of the national and religious vocation of Israel.

The name of Samson (*Shamshôn*, of which the Massoretic *Shamshôn* is a more modern pronunciation, and later than the LXX, who write *Σαμψών*) means "solar," but neither the name nor the story lends any solid support to Steinhilber's fantastic idea that the hero is a solar myth (compare Wellhausen-Bleek, p. 196). He is a member of an undoubtedly historical family of those Danites who had their standing camp near Zorah, not far from the Philistine border, before they moved north and seized Laish (compare xii 25 with xviii 8, 11, 12). The family of Manohah had an hereditary sepulchre at Zorah, where Samson was said to lie (xvi 31), and their name continued to be associated with Zorah even after the exile, when it appears that the Manabethites of Zorah were reckoned as Calibbites. The name had remained though the race changed (1 Chron i 52, 54). One of Samson's chief exploits is associated with a rock called from its shape "the Ass's Jawbone," from which sprung a fountain called En-hakkore, "the spring of the partridge," and these names have influenced the form in which the exploit is told. The narrative of Samson's marriage and riddle is of peculiar interest as a record of manners, specially noteworthy is the custom of the wife remaining with her parents after marriage (cf Gen ii 24).

SAMUEL (שמואל *Shmū'el*), a seer and "judge" of Israel in the time of the Philistine oppression. His history, as told in the first book of Samuel (compare Psalm xcix 5, Eccles xiv. 13 sq.), is too familiar to call for repetition here, and a critical estimate of his place in Hebrew history has been given in ISRAEL, vol. xii. p. 403. There remain, however, one or two points of detail which may be noticed here. His birthplace was Ramah, or, as it is called in the Hebrew text of 1 Sam. i. 1, Ha-Ramathaim (Ramathem, 1 Macc xi 34, Armathæa, Mat xxvii 57), the identity

of the two names is supported by the Septuagint, which has Aumathaim for Ramah in several passages. Ramah, which appears in 1 Kings xv 17 as a stronghold on the frontier of the kingdoms of Ephraim and Judah, is probably identical with the modern El-Râm, about 5 miles north of Jerusalem, on a hill on the east side of the main road to Shechem and the north. Ramah was also the place where Samuel usually resided in his later days, and from which he made a yearly circuit through a very limited district in the immediate neighbourhood, "judging Israel" (1 Sam. vii 16). None of the cities which he visited is more than a few miles from Ramah. Ramah, according to 1 Sam. i. 1 (where the text is to be corrected by the Septuagint), was a town in the district of Zuph, belonging to the tribe of Ephraim (comp. 1 Sam. ix 5 and 1 Sam. x 2, where the grave of Rachel lies on the frontier between Ephraim and Benjamin, a different localization is given in Gen. xxxv. 19, 20, unless the identification of Bethlehem and Ephrath there is a later gloss).

The original text of 1 Sam. i. 1 does not seem to say explicitly that Samuel's father was an Ephrathite (i.e., of the tribe of Ephraim), though his city was Ephrathite, and 1 Chron. vi 28, 33 [vi 13, 18] makes him a Levite, apparently because a post-exilic family of singers traced their stock from him. The old accounts certainly represent Samuel even as a child as doing priestly service at Shiloh, girt with the ephod and wearing the priestly robe (*mē'ûl*, E. V. "coat," 1 Sam. ii 18 sq.), but at that early date priesthood was by no means confined to Levites, and the story certainly implies that it was not by birth but only by his mother's vow that he was dedicated to the service of the sanctuary. On Samuel's relation to the prophets, see vol. xix p. 815. Compare also SAMUEL, Books of.

SAMUEL, Books of The Hebrew Book of Samuel, like the Hebrew Book of Kings, is in modern Bibles divided into two books, after the Septuagint and Vulgate, whose four books of "kingdoms" answer to the Hebrew books of Samuel and Kings. The connexion between the books of Samuel and Kings has been spoken of in the article KINGS (q.v.). These two books, together with Judges, are made up of a series of extracts and abstracts from various sources worked over from time to time by successive editors, and freely handled by copyists down to a comparatively late date, as the variations between the Hebrew text and the Septuagint show. The main redaction of Judges and Kings has plainly been made under the influence of the ideas of the book of Deuteronomy, and it was in connexion with this redaction that the history from the accession of Solomon onwards was marked off as a separate book (see KINGS). In Samuel the Deuteronomistic hand is much less prominent, but in 1 Sam. vii 2-4, and in the speech of Samuel, ch. xii, its characteristic pragmatism is clearly recognizable, the nature of the old narrative did not invite frequent insertions of this kind throughout the story. So, too, the chronological system which runs through Judges and Kings is not completely carried out in Samuel, though its influence can be traced (1 Sam. iv. 18, vii. 2, xii. 1 sq., xxvii 7, 2 Sam. ii 10 sq., v 4 sq.). In 1 Sam. xii 1, in the note "Saul was — years old when he became king and reigned [two] years over Israel" (lacking in LXX.), one of the numbers has been left blank and the other has been falsely filled up by a mere error of the text, the similar note in 2 Sam. ii 10 seems also to have been filled up at random; it contradicts and disturbs the context. But, though the book of Samuel has been much less systematically edited than Kings, unsystematic additions to and modifications of the oldest narratives were made from time to time on a very considerable scale, and

¹ This is one of an obscure class of proper names (שמות, *šmōt*, *šmōt*), the analogy of which seems to exclude the idea that it is softened from שמואל, "heard of God." It seems rather to mean "name of El," i.e., "manifestation of God's power or will." Compare the title Shem Baal, "name of Baal," given to Astarte on the epitaph of Behmenezar.

in this book, as in Judges, we not seldom find two accounts of the same events which not only differ in detail but plainly are of very different date.

The book as a whole may be divided into three main sections—(1) *Samuel and Saul*, 1 Sam 1–xiv, (2) *The rise and kingdom of David*, 1 Sam xv–2 Sam viii, (3) *The personal history of David's court at Jerusalem* (mainly from a single source, which also includes 1 Kings 1, 1), 2 Sam ix–xxx. Finally, the appendix, 2 Sam xxi–xxiv, must have been added after the book of Kings had been separated from the context to which 1 Kings 1, 1 originally belonged. As the greater part of the book of Samuel is occupied with the history of David, which has been discussed at length in his article, and with that of Samuel and Saul, the chief points of which have been critically examined in the article ISRAEL, a very brief resumé of the contents of each of the main sections must here suffice.

I. The story of Samuel's birth, consecration to the service of the sanctuary at Shiloh, and prophetic calling (1 Sam 1–iii) connects itself through the prophecy of the rejection of the house of Eli (iii 11 sq.) with the history of the disaster of Ebenezer and the capture and restoration of the ark (iv 1–vii 1). But the second of these two sections does not seem to have been originally written as the sequel to chaps 1–iii, in that we lose sight of Samuel and his prophetic allegiance. The song of Hannah (i 1–10) and the prophecy of the nameless man of God (ii 27–36) are later insertions (see Wellhausen-Bleek, *Erl.*, p. 207).

Chap vii, with its Deuteronomistic introduction (verses 2–4) and its account of a victory at Ebenezer (the counterpart of the defeat in chap iv) which delivered Israel from the Philistines during all the days of Samuel, is inconsistent with the position of the Philistine power at the accession of Saul. The chapter in its present form must be late, though hardly post-exilic, and it is the necessary introduction to the later and less authentic account of the way in which Saul came to the kingdom (chaps viii, x, 17–27, xxi). It should be noted, however, that, though Samuel is taken by the late narrator to have a widespread authority, inconsistent with the facts disclosed in the older narrative of the choice of Saul, the sphere assigned to him in vi 16, 17 is very narrow and agrees with chap ix.

Of the beginnings of the kingship of Saul we have a twofold account, the older being that in ix 1–x 16, xii. The relative value of the two accounts has been already discussed in ISRAEL, vol. xii, p. 408. The older history is continued in chaps xiii, xiv, but here xii 7b–16—a doublette of the account of the rejection of Saul in chap xiv—is certainly foreign to the original context. The summary of Saul's exploits in xiv 47 sq. is written by an admirer, who appears to ascribe to him some of David's victories. But this does not affect the value of the preceding more detailed narrative, which is plainly based on a full and authentic tradition.

II. The account of the campaign against Amalek (chap xv) does not merely supply details supplementary to xiv 48 but puts the war with Agag in quite a different light by laying the chief weight on Saul's disobedience to Samuel and rejection by the prophet. This passage is closely allied to 1 Sam xxvii 8–25, which, however, is no part of the original story of Saul's defeat and death, as appears by comparing the position of the two armies in xxvii 4 and xxix 1. Chap xv, in like manner, is probably no original part of the narrative of David's rise, to which it now forms the introduction, and both passages, though relatively ancient additions, represent a type of religious thought and a view of prophecy which can hardly be older than the epoch of Elisha (comp. PROPHET, vol. xix, p. 616). The anointing of David (xvi 1–13) presupposes chap xv, and the signs which attend Saul's death and burial, as appears by comparing the position of the two armies in xxvii 4 and xxix 1. Chap xv, in like manner, is probably no original part of the narrative of David's rise, to which it now forms the introduction, and both passages, though relatively ancient additions, represent a type of religious thought and a view of prophecy which can hardly be older than the epoch of Elisha (comp. PROPHET, vol. xix, p. 616). The anointing of David (xvi 1–13) presupposes chap xv, and the signs which attend Saul's death and burial, as appears by comparing the position of the two armies in xxvii 4 and xxix 1.

III. The story of David's introduction to Saul is told in two forms (xvi 14–28, xvii 1–xviii 5). In the former David is already a man of approved courage and parts when he is introduced to the court, in the latter he is an obscure and untutored shepherd lad (as in chap xvi) when he volunteers to meet Goliath. In the Hebrew text the contradiction between the two accounts is absolute, but the Septuagint omits xvi 12–31, xvii 55–xviii 5, which greatly lessens if it does not entirely remove the difficulty. The rise of Saul's jealousy against David (xviii 6–30) and the open breach between them, with David's flight from the court (xix, xx), are very confused in the Hebrew text. Some serious difficulties are escaped

by following the Septuagint recension, but others remain, and there is a good deal of confusion also in the accounts of David's life as an outlaw (xvi–xxvi) and with Achish (xxvii). For details see DAVID, vol. vi, p. 388 sq. The narrative is largely made up of detached anecdotes, and sometimes there were two divergent anecdotes based on a single incident. This is clear as regards the two stories of David's generosity to Saul (xxiv, xxv) and still more clear where the LXX omits one of two parallel anecdotes (see DAVID, *ut supra*), while the same account may perhaps be given of the twofold narrative of David's flight from Saul and of his betaking himself to Achish. At the same time there is sufficient connexion to show that the doublets and additions are strung on an original thread of continuous history—a history of David, which becomes more free from foreign accretions at the point where the outlaw and refugee acquires, through the death of Saul, a position of commanding importance. Saul's defeat and death (1 Sam xxviii 1, 2, xxv) are related as part of the history of David, which runs on from this point with little evidence of editorial additions to the close of 2 Sam v. The summary account of David's war and government in 2 Sam viii appears to be the continuation of the same document, chaps vi and vii, on the other hand, seem to have an independent source.

III. The history of David's court, a vivid picture of events which must be referred in substance if not in form to a contemporary observer, is in its origin a distinct book from the life of David that closes with 2 Sam viii. It extends over 2 Sam ix–1 Kings ii with very little appearance of interpolation except the great appendix, 2 Sam xxi–xxiv, and is throughout one of the most admirable and most ancient remains of Hebrew history.

The appendix is made up of various pieces,—chap xxiv appearing to attach itself directly to xii 1–14, while xxi 15 sq. is akin in subject to xxii 8 sq., the two poems, chap xxiii (Psalm xlvii) and xxiii 1–7, have no relation to the context, so that we can only say of them that they were accepted as Davidic at the time—posterior to the Deuteronomistic redaction—when the miscellaneous matter of the appendix was incorporated with our book.

In this rapid sketch it has not been attempted to notice all the minor marks of editorial retouching found in one or both of the two great recensions of the text. For all details the reader must refer principally to Wellhausen's repeated studies of the book, first in his *Fest der Buche Samuelis*, 1871, then in the fourth edition of Bleek's *Einhundert*, 1878, and finally in his *Prolegomena to the History of Israel* (Eng. tr., 1886). Of earlier works on the subject the relative parts of the two recensions are the most important. The commentaries of Theodor (1st ed. 1842, 2d ed. 1869) and Keil (1848, Eng. tr. 1889) are not very satisfactory. In English Prof. Kilpatrick's short commentary (in the Cambridge Bible for Schools) will be found useful. See also F. E. Woods in *Studia Biblica*, Oxford, 1888.

SANAA (San'a'), the capital of Yemen in Arabia, and seat of the Turkish governor of that province, is situated in 15° 22' N. lat. and 44° 31' E. long., in a well-watered upland valley, 4000 feet above the sea and six to nine miles broad, running north and south between two tablelands. The western table-land, over which lies the road to the port of Hodaida on the Red Sea, rises 1200 feet above the town, the eastern (J. Nokom) is some 300 feet higher, and crowned by the ruins of the fortress Burash, which local tradition connects with the name of Shem, son of Noah, to whom the foundation of the city is attributed by Hamdani, *Jadidat*, p. 55. Under Mount Nokom in the valley is the hill Ghomdan with the citadel, which Halévy in 1870 found in ruins. The ancient fortress of Ghomdan, which is often referred to by poets, and is described in extravagant terms by later writers, is said to have been destroyed by the caliph 'Othman. The city proper, which is walled, extends from the citadel on the east to the garden and ruined palace of the imam Motawakkil on the west. Beyond this is the quarter known as Bir al-'Azab, where the imams had their pleasure gardens, adjoining which, to the south, is the ancient Jewish settlement (Ká' al-Yahúda) in Niebulr's time (1763) the two last were open suburbs, but they have since been walled in. Though Sanaa is a very old town, the earliest buildings now standing are perhaps those which date from the Turkish occupation (1570–1630)—some mosques, parts of the fortifications, the aqueduct. In last century, under the independent imams of Yemen, as the capital of the coffee country and the most fertile region of Arabia, it was, with its palaces and gardens, its mosques, caravanserais, and good private houses, by much the first city of the peninsula. The Wahhabí movement and Turko-Egyptian intervention in the affairs of Yemen shook the power of

¹ A further difficulty is caused by 2 Sam xxi 19, which makes Ethan the Bethlehemitic slayer of Goliath.

the imāms and diminished the prosperity of their capital, but Cruttenden in 1836 still estimated the population at 40,000, or, with the three neighbouring towns of Randa, Jiraf, and Wādy Dahr, at not less than 70,000. In 1870, when the imamate had been extinct for twenty years, and the town was governed by an elected sheikh and had lost its provinces, Hāsfy found it much decayed, with many of the palaces and public buildings demolished or used as quarries, but still presenting a comely aspect, with good streets, houses, and mosques. In 1872, having been hard pressed by the Bedouins for several years, Sanaa opened its gates to the Turks, who were then engaged in the reconquest of Yemen. In the following year Millingen estimated the population at only 20,000.

The climate is good, though the extreme dryness of the air is trying. Rain usually falls in January and June, and more copiously in the end of July, the markets are well supplied with grain and fruit, vineyards were formerly numerous, but were largely given up after an attack of vine disease some thirty years ago.

Arabic writers give many discordant and fabulous traditions about the oldest history of Sanaa and its connection with the ancient kingdom of Himyar. But most agree that its oldest name was *Adā*, which seems to be the same word with *Adā* in Gen. x. 27. A Hymyarite nation of *Azūlātis* occurs in a Syriac writer of the 9th century. The better-informed Arab writers knew also that the later name is due to the Abyssinian conquerors of Yemen, and that it meant in their language "fortified" (Bakri, p. 606, Noldeke, *Gesch. d. Pers. u. Arab.*, p. 187). Sanaa became the capital of the Abyssinian Abahā (c. 530 A.D.) who built here the famous church (*Kāsis*), of whose splendour the Arabs give exaggerated pictures, and which was destroyed two centuries later by order of the caliph Manṣūr (Aḥmad, p. 61).

SANĀ'Ī Abulmajd Maydīd b. Ādam, commonly known as the hakim or philosopher Sanā'ī, the earliest among the great Sūfī poets of Persia, was a native of Ghazna or Ghaznīn (in the present Afghanistan), and flourished in the reigns of the Ghaznavīd sultāns Ibrāhīm (1059–1099, 451–492 A.H.), his son Mas'ūd (1099–1114), and his grandson Bahrāmshāh, who, after some years of desperate struggle among members of his own family, ascended the throne in 1118 (512 A.H.) and died after a long and prosperous reign in 1152 (547 A.H.). The exact dates of the poet's birth and death are uncertain, Persian authorities giving the most conflicting statements. At any rate, he must have been born in the beginning of the second half of the 11th century and have died between 1131 and 1150 (525 and 545 A.H.). He gained already at an early age the reputation of a very learned and pious man and of an accomplished minstrel. Like his contemporaries Mas'ūd b. Sa'īd b. Salāmān (died 1131), Hasan of Ghazna (died 1179), and Uthmān Mukhtār (died 1149 or 1159), who was his master in the poetical art, he composed chiefly *kāsidās* in honour of his sovereign and the great men of the realm, but a peculiar incident made him for ever abandon the highly remunerative although often perilous career of a court-paenegyrist, and turn his poetical aspirations to higher and less worldly aims. One day, when he was proceeding to the royal palace to present an encomiastic song to Sultān Ibrāhīm, he was taunted by a half-mad but witty jester, who proposed a toast to the poet's blindness, because with all his learning and piety he had as yet only succeeded in flattering kings and princes, who were mere mortals like himself, and entirely misinterpreted God's motive in creating him. Sanā'ī was so struck with the appropriateness of this satirical remark that he forthwith gave up all the luxuries of court-life, retired from the world, and devoted himself after the due performance of the pilgrimage exclusively to devotional exercises, pious meditations, and the composition of Sūfī poetry in praise of the Godhead and the divine unity. For forty years he led a life of retirement

and poverty, and, although Sultān Bahrāmshāh offered him not only a high position at court, but also his own sister in marriage, he remained faithful to the austere and solitary life he had chosen. But, partly to show his gratitude to the king, partly to leave a lasting monument of his genius behind him, that might act as a stimulus to all disciples of the pantheistic creed, he began to write his great double-rhymed poem on ethics and religious life, which has served as model to Farīd-uddīn 'Attār and Jalāl-uddīn Rūmī's Sūfī masterpieces, the *Ḥādīqat-ul-hakikat*, or "Garden of Truth" (also called *Alīshād al-fakhrī*), in ten cantos, dealing with the following topics—unity of the Godhead, the divine word, the excellence of the prophet, reason, knowledge and faith, love, the soul, worldly occupation and inattention to higher duties, stars and spheres and their symbolic lore, friends and foes, separation from the world, &c. One of Sanā'ī's earliest disciples, who wrote a preface to this work, 'Alī al-Rāfi'ī, *al-mu* Muhammad b. 'Alī Rakkām, assigns to its composition the date 1131 (525 A.H.), which in a considerable number of copies appears as 1140 (535 A.H.), and states besides that the poet died immediately after the completion of his task. Now, Sanā'ī cannot possibly have died in 1131, as another of his mathnawīs, the *Tawḥīd-tahḥīk*, or "Path to the Verification of Truth," was composed, according to a chronogram in its last verses, in 1134 (528 A.H.), nor even in 1140, if he really wrote, as the Atashkeda says, an elegy on the death of Amīr Mu'izz, for this court-poet of Sultān Sanjār lived till 1147 or 1148 (542 A.H.). It seems, therefore, that Takī Kāshī, the most accurate among Persian biographers, is right after all in fixing Sanā'ī's death in 1150 (545 A.H.), the more so as 'Alī al-Rāfi'ī himself distinctly says in his preface that the poet breathed his last on the 11th of Shā'ban, "which was a Sunday," and it is only in 1150 that this day happened to be the first of the week. Sanā'ī left, besides the *Ḥādīqah* and the *Tawḥīd-tahḥīk*, several other Sūfī mathnawīs of similar purport—for instance, the *Savā' ul-wāḥid ul-ilmād*, or "Man's Journey towards the Other World" (also called *Kunūṣ-ur-rumūt*, "The Treasures of Mysteries"); the *Ishād-nāma*, or "Book of Love," the *Akhḥ-nāma*, or "Book of Intellect," the *Kārnāma*, or "Record of Stirling Deeds," &c., and an extensive *diwān* or collection of lyrical poetry. His tomb, called the "Mecca" of Ghazna, is still visited by numerous pilgrims.

Sanā'ī's *Ḥādīqah* still lacks a critical edition, for which 'Abd-ullatif al-'Abbāsī's commentary (completed 1682 and preserved in a somewhat abridged form in several copies of the India Office Library) would form an excellent basis. See, on the poet's life and works, Ouseley, *Biogr. Notices*, pp. 184–187, Rieu's and Flügel's *Catalogues*, &c.

SAN ANTONIO, a city of the United States, incorporated in 1873, the county-seat of Bexar (Dejar) county and the principal centre of western Texas, is situated in the fertile plain watered by the head-streams of the San Antonio river, which, after a course of 200 miles, falls into the Gulf of Mexico at Espritu Santo Bay. It is an important junction for several of the Texan railways, lying on the main routes from the States to Mexico, 153 miles north of the frontier at Laredo. San Antonio proper, or the business part of the city, lies between the San Antonio and the San Pedro, and has been nearly all rebuilt since 1860. Chihuahua (formerly San Antonio de Valero), west of the San Pedro, is still almost exclusively Mexican, and Alamo, on somewhat higher ground to the east of the San Antonio, is largely inhabited by Germans. The total population of the city was in 1870 12,256 (1957 coloured) and 20,550 (3036) in 1880. Newspapers are published in English, German, and Spanish. Flour, beer, meat-extract, tea, candles, and soap are the local manufactures.

On the site of Chihuahua a fort, San Fernando, was erected by the Spaniards in 1714, and four years later the mission of the Alamo (poplar tree) was established in its vicinity. Both fort and mission were afterwards transferred to the other side of the San Pedro, the fort taking the name of the mission, which was thus destined to become famous in the Texan war, when in 1836 a garrison attacked by a superior Mexican force perished rather than surrender. German immigration began about 1845.

SANCHEZ Three persons of this name once enjoyed considerable literary celebrity—(1) FRANCISCO SANCHEZ (Sanctius) (1523–1601), successively professor of Greek and of rhetoric at Salamanca, whose *Minerva*, first printed at that town in 1587, was long the standard work on Latin grammar, (2) FRANCISCO SANCHEZ, a Portuguese physician of Jewish parentage, professor of philosophy and physic at Toulouse, where he died at the age of seventy in 1632, whose ingenious but sophistical writings (*Quod nihil scitur*, 1581) mark the high-water of reaction against the dogmatism of the traditional schools of his time, (3) THOMAS SANCHEZ of Cordova (1551–1610), Jesuit and casuist, whose treatise *De Mahummo* (Genoa, 1592) is more notorious for its repulsive features than celebrated for its real learning and ability.

SANCHO I (1154–1211) and **SANCHO II** (1208–1248), kings of Portugal from 1185 and 1223 respectively. See PORTUGAL, vol. xix p. 541–2.

SANCHUNIATHON, (that is, סַנְחֻנְיָתָן, "the god Sakun hath given") is the name of the pretended author of the Phœnician writings said to have been used by PHILLO BYBLIUS (*q.v.*) Also see PHENICIA, vol. xviii p. 803.

SAN CRISTOBAL DE LOS LLANOS, otherwise known as CIUDAD REAL, chief town of the Mexican state of Chiapas, stands in a fertile valley on the eastern slope of the central mountain range 450 miles east-south-east from the city of Mexico. It was founded in 1528 under the name of Villa Real, and received its present name in 1829. Its inhabitants, variously estimated as numbering from 8000 to 12,000, are chiefly employed in rearing cattle. Coarse woollen and cotton stuffs, and also common earthenware, are manufactured.

SANCROFT, WILLIAM (1616–1693), archbishop of Canterbury, was born at Fressingfield in Suffolk 30th January 1616, and entered Emmanuel College, Cambridge, in July 1634. He became M.A. in 1641 and fellow in 1642, but was ejected in 1649 for refusing to accept the "Engagement." He then remained abroad till the Restoration, after which he was chosen one of the university preachers, and in 1663 he was nominated to the deanery of York. In 1664 he was installed dean of St Paul's. In this situation he set himself with unwearied diligence to repair the cathedral, till the fire of London in 1666 necessitated the rebuilding of it, towards which he gave £1400. He also rebuilt the deanery, and improved its revenue. In 1668 he was admitted archdeacon of Canterbury upon the king's presentation, but he resigned the post in 1670. In 1677, being now prolocutor of the Convocation, he was unexpectedly advanced to the archbishopric of Canterbury. He attended Charles II. upon his deathbed, and "made to him a very weighty exhortation, in which he used a good degree of freedom." He wrote with his own hand the petition presented in 1687 against the reading of the Declaration of Indulgence, which was signed by himself and six of his suffragans. For this they were all committed to the Tower, but after a trial for misdemeanour they were acquitted. Upon the withdrawal of James II. he concurred with the Lords in a declaration to the prince of Orange for a free parliament, and due indulgence to the Protestant dissenters. But, when that prince and his consort were declared king and queen, he refused to take the oath to them, and was accordingly suspended and deprived. From 5th August 1691 till his death on Novem-

ber 24, 1693, he lived a very retired life in his native place. He was buried in the churchyard of Fressingfield, where there is a Latin epitaph to his memory.

He published *Two Prodestinatus* (1651), *Modern Politics* (1659), and *Three Seasons* (1694). *Nathaniel Familiar Letters to Mr North* (afterwards Sir Henry North) appeared in 1757. He is characterized by Macaulay as "an honest, pious, narrow-minded man."

SANCTUARY is the Christian representative of the classical *ASYLUM* (*q.v.*), and was no doubt suggested in the first instance by the cities of refuge of the Levitical law. Originally every church or churchyard was a sanctuary for criminals. In England about thirty churches, from a real or pretended antiquity of the privilege, acquired special reputation as sanctuaries, *e.g.*, Westminster Abbey and Beverley Minster. "The precincts of the Abbey," says Dean Stanley, "were a vast cave of Adullam for all the distressed and discontented in the metropolis who desired, according to the phrase of the time, to take Westminster." The sanctuary seats at Hexham and Beverley and the sanctuary knocker at Durham are still in existence. The protection afforded by a sanctuary at common law was this—"a person accused of felony might fly for the safeguard of his life to sanctuary, and there before the coroner, within forty days, confess the felony and take an oath of abjuration entailing perpetual banishment into a foreign Christian country. The sanctuary being the privilege of the church, it is not surprising to find that it did not extend to the crime of sacrilege, nor was it held to extend to high or petty treason. The law of abjuration and sanctuary was regulated by numerous and intricate statutes. A list of them will be found in Coke, *Institutes*, vol. iii. p. 115. Finally it was enacted by 21 Jac. I. c. 28, § 7, that no sanctuary or privilege of sanctuary should be admitted or allowed in any case. The privilege of sanctuary as protecting from civil process extended to certain places, parts or supposed parts of royal palaces, such as White Friars or Alsacia, the Savoy, and the Mint. The privilege of these places was abolished by 8 and 9 Will. III. c. 27, and 9 Geo. I. c. 28 (See Stephen, *History of the Criminal Law*, vol. i., c. xiii).

In Scotland religious sanctuaries were abolished at the Reformation. But the debtor still finds sanctuary from diligence in Holyrood House and its precincts. The sanctuary does not protect criminals, or even all debtors, *e.g.*, not crown debtors or fraudulent bankrupts, and a *writatus fugas* warrant may be executed within the sanctuary. After twenty-four hours' residence the debtor must enter his name in the record of the Abbey Court in order to entitle him to further protection. Under the Act 1696, c. 5, insolvency concurring with reticence to the sanctuary constitutes notorious bankruptcy (see Bell, *Commentaries*, vol. ii. p. 461).

SAND, GEORGE See DUDEVANT.

SANDALWOOD, a fragrant wood obtained from various trees of the natural order *Santalaceæ* and from the genera *Santalum* and *Frasum*. The principal commercial source of sandalwood is *Santalum album*, L., a native of India, but it is also yielded by *S. Freycinetianum*, Gaud., and *S. pygmaeum*, A. Gray, in the Hawaiian Islands, *S. Homei*, Seem., and *S. austro-caledonicum*, Viell., in New Caledonia, and *S. insulare*, Bert., in Tahiti. The wood of *S. latifolium*, Benth., and also that of *Frasum speciosum*, R. Br., have been exported from south-west Australia, and that of *Tremophila Mitchellii*, of the natural order *Myoporaceæ*, from Queensland, but these have little odour and are chiefly used for cabinet work. Sandalwood is also said to be produced in Nossi-Bé, and has been imported into London from Zanzibar, and into Germany from Venezuela, but of the botanical source of these varieties little is at present known. The use of sandalwood dates as far back at least as the 5th century B.C., for the wood is mentioned under its Sanskrit name "chandana" in the *Nirukta*, the earliest extant Vedic commentary. It is still extensively used in India and China, wherever Buddhism prevails, being em-

played in funeral rites and religious ceremonies, comparatively poor people often spend as much as 50 rupees on sandalwood for a single cremation. Until the middle of the 18th century India was the only source of sandalwood. The discovery of a sandalwood in the islands of the Pacific led to a considerable trade of a somewhat practical nature, resulting in difficulties with the natives, often ending in bloodshed, the celebrated missionary John Williams, amongst others, having fallen a victim to an indiscriminate retaliation by the natives on white men visiting the islands. The loss of life in this trade was at one time even greater than in that of whaling, with which it ranked as one of the most adventurous of callings. About the year 1810 as much as 400,000 dollars is said to have been received annually for sandalwood by Kamehameha, king of Hawaii. The trees consequently have become almost extinct in all the well-known islands, except New Caledonia, where the wood is now cultivated. Sandalwood of inferior quality derived from *Panus acuminatus* was exported from south-west Australia in 1884 to the extent of 2620 tons, valued at an average of about £8 per ton, genuine sandalwood being worth in China from £12 to £40 per ton.

In India sandalwood is largely used in the manufacture of boxes, fans, and other ornamental articles of inlaid work, and to a limited extent in medicine as a domestic remedy for all kinds of pains and aches. The oil is largely used as a perfume, few native Indian attars or essential oils being free from admixture with it. In the form of powder or paste the wood is employed in the pigments used by the Brahmans for their distinguishing caste-marks.

During the last few years oil of sandalwood has largely replaced copoba, both in the United Kingdom and on the Continent, in the treatment of various diseases of the mucous membrane. Three varieties are distinguished in trade—East-Indian, Macassar, and West-Indian. The first-named is derived from *S. album*, the second probably from another species of *Santalum*, and the third from a wood imported from Puerto Cabello in Venezuela. *Bucida capitata*, a Combretaceae plant, is known in the West Indies as sandalwood, but the odour of the wood as well as of the oil, which is quite distinct from that of the true sandalwood, has more resemblance to that of a *Myrsylon*. Inferior qualities of the oil are said to be adulterated in Germany with the oil of red cedar wood (*Juniperus virginiana*).

In India sandalwood is produced in the dry tracts of country in Mysore and Combarbore, north and north-west of the Nilgiri Hills, also farther eastward in the districts of Salem and North Arcot, where the tree grows from the sea-level up to an elevation of 8000 feet. In the first-named district the wood is a Government monopoly and can only be felled by the proper officers, this privilege having been retained since 1770, when it was conferred by treaty with Hyder Ali on the East India Company. The Mysore sandalwood is shipped from Mangalore to the extent of about 700 tons annually, valued at £27,000. In the Madras Presidency—although there is now no monopoly—sandalwood, by the careful management of the forest department, has been made to yield an increasing revenue to the Government, as much as 54½ tons having been furnished by the reserved forests in 1872-3. The tree is propagated by seeds, which, however, must be placed where they are intended to grow, since the seedlings will not bear transplantation, probably on account of depriving their neighbourhood paucitatively by means of tuberous swellings attached to the roots of other plants. The trees are cut down when between eighteen and twenty-five years old, at which period they have attained their maturity, the trunks being then about one foot in diameter. The felling takes place at the end of the year, and the trunk is allowed to remain on the ground for several months, during which time the white ants eat away the valueless sapwood, but leave the fragrant heartwood untouched. The heartwood is then sawn into billets about 2 or 2½ feet long. These are afterwards more carefully trimmed at the forest depôts, and left to dry slowly in a close warehouse for some weeks, by which the odour is improved and

the tendency of the wood to split obviated. An annual auction of the wood takes place, at which merchants from all parts of India congregate. The largest pieces are chiefly exported to China, the small pieces to Arabia, and those of medium size are retained for use in India. China imported into the treaty ports 66,387 piculs (of 133 lb) of sandalwood in 1872. As much as 700 tons are annually imported into Bombay from the Malabar coast, of which about 450 tons are again exported. The oil, which is distilled chiefly at Mangalore from the roots and chips, is also imported into Bombay to the extent of 12,000 lb annually.

Red Sandalwood, known also as *Red Sanders Wood*, is the product of a small Leguminous tree, *Pterocarpus santalinus*, native of Southern India, Ceylon, and the Philippine Islands. The wood is obtained principally from Madras, in certain parts of which province it is regularly cultivated, coming into the market in the form of irregular billets of heartwood, 3 or 4 feet in length. A fresh surface of the wood has a rich deep red colour, which on exposure, however, assumes a dark brownish tint. Under the influence of alkaline solutions, alcohol, or strong acetic acid, red sandalwood yields up to 16 per cent of a resinoid body, santalin or santalol acid, $C_{17}H_{17}O_6$ (?), which substance is the tinctorial principle of the wood. Santalin is quite insoluble in cold water, it neutralizes alkalis, and with them forms uncrystallizable salts. In its pure condition santalin forms minute prismatic crystals of a beautiful ruby colour. The wood also contains small proportions of colourless crystalline principles—santal, $C_{17}H_{17}O_6$, and pterocarpin, $C_{17}H_{19}O_6$ —and of an amorphous body having the formula $C_{17}H_{19}O_6$. In medieval times red sandalwood possessed a high reputation in medicine, and it was valued as a colouring ingredient in many dishes. Now it is a little used as a colouring agent in pharmacy, its principal application being in wool-dyeing and calico-printing. Several other species of *Pterocarpus*, notably *P. vanderus*, contain the same dyeing principle and can be used as substitutes for red sandalwood. The barwood and camwood of the Guinea Coast of Africa, presumably the produce of one tree, *Bophora nvidia* (*Pterocarpus angolensis* of De Candolle), called *santal rouge d'Afrique* by the French, are also in all respects closely allied to the red sandalwood of Oriental countries.

SANDARACH is a resinous body obtained from the small Coniferous tree *Callitris quadrivalvis*, native of the north-west regions of Africa, and especially characteristic of the Atlas Mountains. The resin, which is procured as a natural exudation on the stems, and also obtained by making incisions in the bark of the trees, comes into commerce in the form of small round balls or elongated tears, transparent, and having a delicate yellow tinge. It is a little harder than mastic, for which it is sometimes substituted, and does not soften in the mouth like that resin, but, being very brittle, it breaks with a clean glassy fracture. Sandarach has a faintly bitter resinous taste, and a pleasant balsamic odour. It consists of a mixture of three distinct resins, the first readily soluble in alcohol, constituting 67 per cent of the mass, while the second dissolves with more difficulty, and the third is soluble only in hot alcohol. Sandarach is imported chiefly from Mogador, and is an important ingredient in spirit varnishes. It is also used as incense, and by the Arabs medicinally as a remedy for diarrhoea. An analogous resin is procured in China from *Callitris sinensis*, and in South Australia, under the name of pine gum, from *C. Resina*.

SANDBACH, a town and urban sanitary district of Cheshire, is situated on the Trent and Mersey Canal, and on the London and North-Western Railway, at the junction for Northwich, 25 miles east-south-east of Chester and 5 north-east of Crewe. In the market-place are two ancient obelisks, dating, according to some, from the 7th century. The principal public buildings are the parish church of St Mary, in the Perpendicular style, with a tower rebuilt 1847-9, the grammar school, the public reading rooms, and the town-hall. Anciently the town was celebrated for its ale. The principal industry was formerly silk throwing, but this is now discontinued, and the inhabitants are chiefly employed in the salt-works and

alkali-works The population of the urban sanitary district (area 2694 acres) in 1871 was 5259, and in 1881 it was 5493

SAND-BLAST. The erosive influence of driven sand is turned to useful account for several industrial purposes by means of an apparatus devised, about 1870, by Mr B. C. Tilghman of Philadelphia. Tilghman's sand-blast consists of a contrivance for impelling, with graduated degrees of velocity, a jet or column of sand, by means of compressed air or steam, against the object or surface to be acted on. The apparatus is principally adapted for obscuring, engraving, and ornamenting glass, but according to the velocity with which the sand is impelled it may be used to carve deep patterns in granite, marble, and other hard stones, to bite into steel, &c, and even to cut and perforate holes through these and other most refractory materials. Sheets of glass 4 feet wide are obscured at the rate of 3 feet per minute, with a blast of air having a pressure of 1 lb per inch. With the aid of tough elastic stencils, patterns and letters are engraved on flashed glass, globes for lamps and gaslights are ornamented, druggists' bottles are lettered, &c.¹ Driven with moderate velocity against a metal surface, the sand produces by its impact a fine uniform pitted appearance without removing the metal, and in this way it is used for "frothing" plated goods. A strong blast is largely used for sharpening files, which, as they leave the cutter, have always a slight backward curve or "burr" on their cutting edges which blunts their biting effect. By directing a blast of very fine sand, mixed with water into a thin mud, with steam pressure of 70 lb, at an angle against the back of the teeth, this burr is ground off, the shape of the teeth is improved, and the file is rendered very keen. While the use of steam for impelling the sand-blast is most simple and economical, many practical difficulties have hitherto been found in the way of its employment, and consequently for obtaining high pressure of air costly apparatus was required, thus limiting the applications of the agency. In 1884 Mr Mathewson patented an apparatus in which, by an ingenious exhaust arrangement, the impelling steam is swept away, leaving only cool, dry sand to strike against the object acted on, and the success of this device has already opened up a wider field for the employment of the sand-blast.

SANDBY, PAUL (1725-1809), founder of the English school of water-colour painting, was descended from a branch of the Sandbys of Babworth, and was born at Nottingham in 1725. After commencing his artistic studies in London, in 1746 he was appointed by the duke of Cumberland draughtsman to the survey of the Highlands. In 1752 he quitted this post, and retired to Windsor, where he occupied himself with the production of water-colour drawings of scenery and picturesque architecture, which brought him under the notice of Sir Joseph Banks, who gave him his patronage, and subsequently commissioned him to bring out in aquatinta (a method of engraving then peculiar to Sandby) forty-eight plates drawn during a tour in Wales. Sandby displayed considerable power as a caricaturist in his attempt to ridicule the opposition of Hogarth to the plan for creating a public academy for the arts. He was chosen a foundation member of the Royal Academy in 1768, and the same year was appointed chief drawing-master to the Royal Military Academy at Woolwich. He held this situation till 1799, and during that time he trained many artists

who afterwards gained a name in their profession. Sandby will be best remembered, however, by his water-colour paintings. They are topographical in character, and, while they want the richness and brilliancy of modern water-colour, he nevertheless impressed upon them the originality of his mind. In his later pieces, in particular, decided progress is observable in richness and in harmony of tinting, and they also show a measure of poetic feeling, due, in great part, to the influence of Cozens. His etchings, such as the *Cries of London* and the illustrations to Ramsay's *Gentle Shepherd*, and his plates, such as those to Tasso's *Jerusalem Delivered*, are both numerous and carefully executed. He died in London on the 9th November 1809.

SANDEAU, LÉONARD SYLVAIN JULES (1811-1882), a French novelist of much grace and not a little power, was born at Aubusson (Creuse) on February 9, 1811. He made acquaintance as an art student with Madame Dudevant (George Sand), who had just taken to an unrestrained literary life at Paris. The intimacy did not last long, but it produced *Rose et Blanche* (1831), a novel written in common, and from it George Sand took the idea of the famous *nom de guerre* by which she is and always will be known. Sandeau's subsequent work showed that he could run alone, and for nearly fifty years he continued to produce novels and to collaborate in plays. His best works are *Marranna* (1839), *Le Docteur Herbeau* (1841), *Cathérine* (1845), *Mademoiselle de la Seiglière* and *Mademoiselle* (1848), *La Chasse au Roman* (1849), *Sacs et Parchemins* (1851), *La Maison de Penarvan* (1858), *La Roche aux Mouettes* (1871). The famous play of *Le Gendre de M. Poirier* is only one of several which he wrote with Émile Augier,—the novelist usually contributing the story and the dramatist the theatrical working up. Meanwhile Sandeau, who had accepted the empire, but who never took any active part in politics, had been made conservator of the Mazarin library in 1853, elected to the Academy in 1858, and next year appointed librarian of St Cloud. At the suppression of this latter office, after the fall of the empire, he was pensioned. He died on the 24th of April 1882. He was never a very popular novelist, judging by the sale of his works, and the peculiar quiet grace of his style, as well as his abstinence from sensational incident, and his refusal to pander to the French taste in fictitious morals, may be thought to have disqualified him for popularity. But his literary ability has always been recognized by competent judges. His skill in construction was very great, his character-drawing, though pure, is eminently free from feebleness and commonplace, and of one particular situation—the tragical clashing of aristocratic feeling with modern tendencies—he had an extraordinary mastery, which he showed without any mere repetition, but in many different studies.

SANDEO See NEU-SANDEO

SAND-EEL or **SAND-LAUNCE**. The fishes known under these names form a small isolated group (*Ammodytina*), distantly related to the cod-fishes. Their body is of an elongate-cylindrical shape, with the head terminating in a long conical snout, the projecting lower jaw forming the pointed end. A low long dorsal fin, in which no distinction between spines and rays can be observed, occupies nearly the whole length of the back, and a long anal, composed of similar short and delicate rays, commences immediately behind the vent, which is placed about midway between the head and caudal fin. The caudal is forked and the pectorals are short. The total absence of ventral fins indicates the burrowing habits of these fishes. The scales, when present, are very small, but generally the development of scales has only proceeded to the formation of oblique folds of the integuments

¹ In 1875 inscriptions were cut by means of the blast on 150,000 tombstones of soldiers killed in the American Civil War. Cast-iron letters were fastened by shellac on the marble, the sand was driven by steam pressure of 90 lb, and the stone was cut, in four minutes, to a depth of a quarter of an inch, leaving the letters in relief.

The eyes are lateral and of moderate size, the dentition is quite rudimentary.

Sand-eels are small littoral marine fishes, only one species attaining a length of 18 inches (*Ammodytes lanceolatus*). They live in shoals at various depths on a sandy bottom, and bury themselves in the sand on the slightest alarm. They are able to do this with the greatest ease and rapidly whilst the bottom is covered with water. Many of those which live close inshore are left by the receding tide buried in the sand, and are then frequently dug out from a depth of one or two feet. Other shoals live in deeper water, when they are surprised by fish of prey or porpoises, they are frequently driven to the surface in such dense masses that numbers of them can be scooped out of the water with a bucket or hand-net. In fact, this used to be, in the Channel Islands, the common practice of the fishermen to provide themselves with bait. Some species descend to a depth of 100 fathoms and more, and the greater sand-eel is not rarely taken on the mackerel line far out at sea near the surface. Sand-eels are very rapacious, destroying a great quantity of fry and other small creatures, such as the lancelet (*Branchiostoma*), which lives in similar localities. They are excellent eating, and are much sought after for bait.

Sand eels are common in all suitable localities of the North Atlantic, a species scarcely distinct from the European common sand-lance occurs on the Pacific side of North America, another on the east coast of South Africa. On the British coasts three species are found—the Greater Sand-Eel (*Ammodytes lanceolatus*), distinguished by a tooth-like bicuspid prominence on the vomer, the Common Sand-Lance (*A. tobianus*), from five to seven inches long, with unpaired vomer, even dorsal fin, and with the integuments folded, and the Southern Sand-Lance (*A. nauticus*), with unpaired vomer, smooth skin, and with the margins of the dorsal and anal fins undulated. The last species is common in the Mediterranean, but local farther northwards. It has been found near the Shetlands at depths from 80 to 100 fathoms, and is generally distinguished from the common species by the fishermen of the Channel Islands, who have a tradition that it appeared suddenly on their coasts some fifty years ago.

SANDEMANIANS See GLAS, vol. x, p. 637.

SANDERSON, ROBERT (1587–1663), bishop of Lincoln, and one of the worthies celebrated by Izaak Walton, was born at Rotherham, Yorkshire, in 1587. He was educated at the grammar school of his native town and at Lincoln College, Oxford, took orders in 1611, and was promoted successively to several benefices. On the recommendation of Laud he was appointed one of the royal chaplains in 1631, and as a preacher was a great favourite with the king. In 1642 Charles created him regius professor of divinity at Oxford, with a canonry of Christ Church annexed. But the civil war prevented him until 1646 from entering on the office, and in 1648 he was ejected by the visitors whom the parliament had commissioned. He recovered these preferments at the Restoration, and was promoted to the bishopric of Lincoln, but lived only two years to enjoy his new dignities, dying in his seventy-sixth year in 1663. His most celebrated work is his *Cases of Conscience*, deliberate judgments upon points of morality submitted to him. Some of these cases, notably that of Sabbath observance, and that of signing the “Engagement” to the Commonwealth, were printed surreptitiously during his lifetime, though drawn up in answer to private spiritual clients, and a collection, gradually enlarged in successive editions, was published after his death. They are extremely interesting specimens of English casuistry, distinguished not less by moral integrity than good sense, learning, and close, comprehensive, and subtle reasoning. His practice as a college lecturer in logic is better evidenced by these “cases” than by his *Compendium of Logic* published in 1615. A complete edition of Sanderson's works was edited by Dr Jacobson in 1854 (Oxford Press). To this the reader may be referred

for his sermons and his occasional tracts on public affairs during the troubled period of his middle life and old age.

SAND-GROUSE, the name¹ by which are commonly known the members of a small but remarkable group of birds frequenting sandy tracts, and having their feet more or less clothed with feathers after the fashion of Grouse (vol. xi, p. 231), to which they were originally thought to be closely allied, and the species first described were by the earlier systematists invariably referred to the genus *Tetrao*. Their separation therefrom is due to Temminck, who made for them a distinct genus which he called *Pterocles*,² and his view, as Lesson tells us (*Zoot.*, p. 515), was subsequently corroborated by De Blainville, while in 1831 Bonaparte (*Saggio*, p. 54) recognized the group as a good family, *Pedophilus* or *Pterocula*. Further investigation of the osteology and pterylosis of the Sand-Grouse revealed still greater divergence from the normal *Gallina* (to which the true Grouse belong), as well as several curious resemblances to the Pigeons, and in the Zoological Society's *Proceedings* for 1868 (p. 303) Prof. Huxley proposed to regard them, under the name of *Pterocloromorphæ*, as forming a group equivalent to the *Alectoromorphæ* and *Peristeromorphæ*, for reasons already briefly stated (ORNITHOLOGY, vol. xvii, p. 46).³ The *Pteroculæ* consist of two genera—*Pterocles*, with about fifteen species, and *Synrhaptæ*, with two. Of the former, two species inhabit Europe, *P. arenarius*, the Sand-Grouse proper, and that which is usually called *P. alchata*, the Pin-tailed Sand-Grouse. The European range of the first is practically limited to Portugal, Spain, and the southern parts of Russia, while the second inhabits also the south of France, where it is generally known by its Catalan name of “*Ganya*,” or locally as “*Gandaulo*,” or, strange to say, “*Pedrus d'Angleterre*.” Both species are also abundant in Barbary, and have been believed to extend eastwards through Asia to India, in most parts of which country they seem to be only winter-visitors, but in 1880 Herr Bogdanow pointed out to the Academy of St Petersburg (*Bulletin*, xxvii, p. 164) a slight difference of coloration between eastern and western examples of what had hitherto passed as *P. alchata*, and the difference, if found to be constant, may require the specific recognition of each, while analogy would suggest that a similar difference might be found in examples of *P. arenarius*. India, moreover, possesses five other species of *Pterocles*, of which however only one, *P. fasciatus*, is peculiar to Asia, while the others inhabit Africa as well, and all the remaining species belong to the Ethiopian region—one, *P. personatus*, being peculiar to Madagascar, and four occurring in or on the borders of the Cape Colony.

The genus *Synrhaptæ*, though in general appearance resembling *Pterocles*, has a conformation of foot quite unique among birds, the three anterior toes being encased in a common “podotheca,” which is clothed to the claws with hairy feathers, so as to look much like a fingerless glove. The hind toe is wanting. The two species of *Synrhaptæ* are *S. tibetanus*—the largest Sand-Grouse known—inhabiting the country whence its trivial name is derived, and *S. paradoxius*, ranging from Northern China across Central Asia to the confines of Europe, which it occupies.

¹ It seems to have been first used by Latham in 1783 (*Synopsis*, iv, p. 751) as the direct translation of the name *Tetrao arenarius* given by Pallas.

² He states that he published this name in 1809; but hitherto research has failed to find it used until 1815.

³ Some more recent writers, recognizing the group as a distinct Order, have applied to it the name “*Pterocletæ*,” while another calls it *Heterocletæ*. The former of these words is based on a grammatical misconception, while the use of the latter has long since been otherwise preoccupied in zoology. If there be need to set aside Prof. Huxley's term, Bonaparte's *Pedophilus* (as above mentioned) may be accepted, and indeed has priority of all others.

sionally, and in a marvellous manner, invades, as has been already briefly described (BIRDS, vol. 1, 770)¹. Though its attempts at colonization in the extreme west have failed, it would seem to have established itself of late years in the neighbourhood of Astrakhan (*Ibis*, 1882, p. 220). It appears to be the "Barguerlac" of Marco Polo (ed. Yule, 1, p. 239), and the "Loung-Kio" or "Dragon's Foot," so unscientifically described by the Abbé Huc (*Souvenirs d'un Voyage dans la Tartarie*, 1, p. 244), can scarcely be anything else than this bird.

Externally all Sand-Grouse present an appearance so distinctive that nobody who has seen one of them can be in doubt as to any of the rest. Their plumage assimilates in general colour to that of the ground they frequent, being above of a dull ochraceous hue, more or less barred or mottled by darker shades, while beneath it is frequently varied by belts of deep brown intensifying into black. Lighter tints are, however, exhibited by some species,—the diab merging into a pale grey, the buff brightening into a lively orange, and streaks or edgings of an almost pure white relieve the prevailing sandy or lawn-coloured hues that especially characterize the group. The sexes seem always to differ in plumage, that of the male being the brightest and most variegated. The expression is decidedly Dove-like, and as the form of the body, the long wings contributing also to that effect, so that among Anglo-Indians these birds are commonly known as "Rock-Pigeons." The long wings, the outermost primary of which in *Syrnuphies* has its shaft produced into an attenuated filament, are in all the species worked by exceedingly powerful muscles, and in several forms the middle rectrices are likewise protracted and pointed, so as to give to their wearers the name of Pin-tailed Sand-Grouse.* The nest is a shallow hole in the sand. These seem to be the regular complements of eggs laid in each nest, but there are writers who declare (most likely in error) that the full number in some species is four. These eggs are of peculiar shape, being almost cylindrical in the middle and nearly alike at each end, and are of a pale earthy colour, spotted, blotched, or marbled with darker shades, the markings being of two kinds, one superficial and the other more deeply seated in the shell. The young are hatched fully clothed in down (*P. Z. S.* 1866, pl. ix. fig. 2), and though not very active would appear to be capable of locomotion soon after birth. Morphologically generalized as the Sand-Grouse undoubtedly are, no one can contest the extreme specialization of many of their features, and thus they form one of the most instructive groups of birds with which ornithologists are acquainted. The remains of an extinct species of *Pterocles*, *P. sepiolus*, intermediate apparently between *P. alchata* and *P. gutturalis*, have been recognized in the Miocene caves of the Albi by Prof. A. Milne-Edwards (*On the fossils of la France*, p. 294, pl. clii. figs 1-9), and in recognition to the other authorities on this very interesting group of birds already cited, reference may be made to Mr Elliot's "Study" of the Family (*P. Z. S.*, 1878, pp. 288-284) and Dr Gadow, "On certain points in the Anatomy of *Pterocles*" (*op. cit.*, 1882, pp. 812-832). (A. N.)

SANDHURST, a city of Victoria, Australia, in the county of Bendigo, is situated in 36° 46' S lat and 144° 17' E. long, at a height of 758 feet above the sea, on Bendigo Creek (a sub-tributary of the Murray), 100½ miles north-west of Melbourne by the railway to Echuca. Built on an exhausted part of old goldfields of Bendigo (1851), and long better known by that name, Sandhurst, which became a municipality in 1855, a borough in 1863, and a city in 1871, has been gradually working itself clear of the irregularity and disorder characteristic of abandoned mines and quartz-crushing enterprises. Pall Mall, the principal street, consists of good houses of two and three stories; and, besides banks, insurance offices, hotels, and churches (many of which are

substantial buildings), there are in Sandhurst Government and municipal offices, a hospital, a benevolent asylum, a mechanics' institute and school of mines, a theatre, and several halls. Rosalind Park, opposite Pall Mall, the Camp Reserve, and the Botanical Gardens are the principal pleasure grounds. A good supply of water has been secured by the construction of five large reservoirs capable of storing in the aggregate upwards of 622,600,000 gallons. Besides gold-mining, which in the Sandhurst district employs 6800 miners, the local industries are brewing, iron-casting, coach-building, the working of bricks and tiles and earthenware, and tanning. The population of the city (which is divided into three wards—Sutton, Darling, and Barkly) was 28,662 in 1881. The value of rateable property is £1,663,910.

SAN DIEGO, a city and port of entry of the United States, chief town of San Diego county, California, 15 miles north of the Mexican frontier. It has a land-locked harbour 5½ miles long and next to San Francisco the best on the Pacific coast of the States, is the selected terminus of the Texas and Pacific Railroad, and has recently become a fashionable winter resort owing to the remarkable steadiness of its winter climate (mean annual temperature 62°). San Diego was founded by Roman Catholic missionaries in 1769. In 1880 it had only 2637 inhabitants, but they have since increased to upwards of 5000. In the county is a lake of boiling mud half a mile long by 500 yards wide.

SAN DOMINGO, or SANTO DOMINGO. See HAYTI. SANDOMIR, or SPDOMIERZ, a town of Russian Poland, in the province of Radom, is one of the oldest towns of Poland, being mentioned in annals as early as 1079, from 1139 to 1332 it was the chief town of the principality Under Casimir III. It received extensive privileges and reached a high degree of prosperity and strength. In 1429 it was the seat of a congress for the establishment of peace with Lithuania, and in 1570 the well-known "Consensus Sandomiriensis" was held there for uniting the Lutherans, Calvinists, and Moravian Brethren. Subsequent wars, and especially the Swedish, ruined the town still more than numerous conflagrations, and in the second part of the 18th century it had only 2060 inhabitants. It is now a quite unimportant place, but retains a few remarkable monuments of its past. The beautiful cathedral, rising on a high hill above the Vistula, and facing the plains of Galicia, was built between 1120 and 1191, it was rebuilt in stone in 1360, and is thus one of the oldest monuments of old Polish architecture. The churches of St Paul and St James are fine relics of the 13th century. In 1881 the population was 6265, or, including the suburbs, 14,710.

SANDOWAY, a district in the south of the Arakan division of British Burmah, ceded to the British by treaty in 1826, embracing an area of 3667 square miles, and bounded on the north by the Ma-i river, on the west by the Bay of Bengal, on the east by the Arakan Mountains, and on the south by the Khwa river. The whole face of the country is mountainous, the Arakan range sending out spurs which reach down to the coast. Some of the peaks in the north attain an elevation of over 4000 feet. Not more than one-eighteenth part of the surface can be called plain, and, except there, where rice cultivation is carried on, and on the hill-sides, where clearings are made for *toungya* or nomadic cultivation, the country is covered with dense forest. There is nothing in the district that can be called a river, the streams draining it being but mountain torrents to within a few miles of the coast, the mouth of the Khwa forms a good anchorage for vessels of from 9 to 10 feet draught. So far as is known of the geology of the district, the rocks in the Yoma range and its spurs are metamorphic, and comprise clay, slates, ironstone, and undurated sandstone, towards the south, ironstone, trap, and

¹ Some slight additions to and corrections of that account may here be given. A single example is stated (*Ibis*, 1871, p. 228) to have been killed in Europe in 1859, namely, at Perpignan, France. One is believed to have been obtained at or near Archangel (*Ibis*, 1873, p. 66), but the report of one in Sicily proves to have been a mistake, and Ruman, on the Adriatic, remains the most southern Italian locality reached in 1863. Since 1872 a male obtained near Modena in May 1876 (*Ibis*, 1881, p. 206), and a pair, one of which was shown to the writer, in the county of Kildare in Ireland, the following October (*Zoologist*, 1877, p. 24), are all that are known to have occurred in Western Europe.

² These were separated by Bonaparte (*Comptes Rendus*, xlii. p. 880) as a distinct genus, *Pteroclorus*, which later authors have justly seen no reason to adopt.

rocks of basaltic character are common, veins of steatite and white fibrous quartz are also found in the district.

Only 135 square miles of the total area are cultivable, and of these but 75 are cultivated. The chief crops are rice, sesamum, tobacco, cotton, sugar-cane, *dhans*, palms, and yams. The revenue in 1883-84 was £18,978, the land tax realizing £6749 of that amount. This mountainous and forest-clad country, with such a small cultivable area, is sparsely inhabited, the population as returned by the census of 1881 being only 64,010 (males 32,706, females 31,304), of this number 56,468 were Buddhists. There are no towns with a population exceeding 5000. Sandeay, the chief town and headquarters, on the river of the same name, in 18° 27' 35" N lat. and 94° 24' 36" E. long., is a very ancient town, and is said to have been at one time the capital of a kingdom, or more probably of a petty chieftainship.

SANDPIPER (Germ. *Sandpfeifer*), according to Willughby in 1676 the name given by Yorkshiresmen to the bird now most popularly known in England as the "Summer-Snipe,"—the *Tringa hypoleucos* of Linnæus and the *Totanus*, *Actitis*, or *Tringoides hypoleucos* of later writers,—but probably even in Willughby's time of much wider signification, as for more than a century it has certainly been applied to nearly all the smaller kinds of the group termed by modern ornithologists *Limcolæ* which are not *PLOVERS* (vol. xix. p. 227), or *SNIPES* (v.), but may be said to be intermediate between them. Placed by most systematists in the family *Scolopacidae*, the birds commonly called Sandpipers seem to form three sections, which have been often regarded as Subfamilies—*Totannina*, *Tringina*, and *Phalaropodina*, the last indeed in some classifications taking the higher rank of a Family—*Phalaropodidae*. This section comprehends three species only, known as Phalaropes or swimming Sandpipers, which are at once distinguished by the membranes that fringe their toes, in two of the species forming marginal lobes,¹ and by the character of their lower plumage, which is as close as that of a Duck, and is obviously connected with their natatory habits. The distinctions between *Totannina* and *Tringina*, though believed to be real, are not so easily drawn, and space is wanting here to describe them minutely. The most obvious may be said to be in the acute or blunt form of the tip of the bill (with which is associated a less or greater development of the sensitive nerves running almost if not quite to its extremity, and therefore greatly influencing the mode of feeding) and in the style of plumage—the *Tringina*, with blunt and flexible bills, mostly assuming a summer-dress in which some tint of chestnut or reddish-brown is very prevalent, while the *Totannina*, with acute and stiffer bills, display no such lively colours. Furthermore, the *Tringina*, except when actually breeding, frequent the sea-shore much more than do the *Totannina*.² To the latter belong the GREEN-SHANK (vol. xi. p. 173) and REDSHANK (vol. xx. p. 317), as well as the Common Sandpiper of English books, the "Summer-Snipe" above-mentioned, a bird hardly exceeding a Skylark in size, and of very general distribution throughout the British Islands, but chiefly frequenting clear streams, especially those with a gravelly or rocky bottom, and most generally breeding on the beds of sand or shingle on their banks. It usually makes its appearance in May, and from thence during the summer-months may be seen in pairs skimming gracefully over the water from one bend of the stream to another, uttering occasionally a

shrill but plaintive whistle, or running nimbly along the margin, the mouse-coloured plumage of its back and wings making indeed but little show, though the pure white of its lower parts often renders it conspicuous. The nest, in which four eggs are laid with their pointed ends meeting in its centre (as is usual among Limcoline birds), is seldom far from the water's edge, and the eggs, as well as the newly-hatched and down-covered young, so closely resemble the surrounding pebbles that it takes a sharp eye to discriminate them. Later in the season family-parties may be seen about the larger waters, whence, as autumn advances, they depart for their winter-quarters. The Common Sandpiper is found over the greater part of the Old World. In summer it is the most abundant bird of its kind in the extreme north of Europe, and it extends across Asia to Japan. In winter it makes its way to India, Australia, and the Cape of Good Hope. In America its place is taken by a closely-kindred species, which is said to have also occurred in England—*T. macularius*, the "Peetweet," or Spotted Sandpiper, so called from its usual cry, or from the almost circular marks which spot its lower plumage. In habits it is very similar to its congener of the Old World, and in winter it migrates to the Antilles and to Central and South America. Of other *Totannina*, one of the most remarkable is that to which the inappropriate name of Green Sandpiper has been assigned, the *Totanus* or *Helodromas ochropus* of ornithologists, which most curiously differs (so far as is known) from all others of the group both in its osteology³ and mode of nidification, the hen laying her eggs in the deserted nests of other birds,—Jays, Thrushes, or Pigeons,—but nearly always at some height (from 3 to 30 feet) from the ground (*Proc. Zool. Society*, 1863, pp. 529-532). This species occurs in England the whole year round, and is presumed to have bred here, though the fact has never been satisfactorily proved, and our knowledge of its erratic habits comes from naturalists in Pomerania and Sweden; yet in the breeding-season, even in England, the cock-bird has been seen to rise high in air and perform a variety of evolutions on the wing, all the while piping whist, without any violence of language, may be called a song. This Sandpiper is characterized by its dark upper plumage, which contrasts strongly with the white of the lower part of the back and gives the bird as it flies away from its disturber much the look of a very large House-Martin. The so-called Wood-Sandpiper, *T. glareola*, which, though much less common, is known to have bred in England, has a considerable resemblance to the species last mentioned, but can at once be distinguished, and often as it flies, by the feathers of the axillary plume being white barred with greyish-black, while in the Green Sandpiper they are greyish-black barred with white. It is an abundant bird in most parts of northern Europe, migrating in winter very far to the southward.

Of the section *Tringina* the best known are the KNOR (vol. xiv. p. 129) and the Dunlin, *T. alpina*. The latter, often also called Ox-bird, Plover's-Page, Furze, and Stint,—names which it shares with some other species,—not only breeds commonly on many of the elevated moors of Britain, but in autumn resorts in countless flocks to the shores, where indeed a few may be seen at almost any time of year. In seasonal diversity of plumage it is scarcely excelled by any bird of its kind, being in winter of a nearly uniform ashy-grey above and white beneath, while in summer the feathers of the back are black, with deep rust-coloured edges, and a broad black belt occupies the breast. The

¹ These are *Phalaropus fulicarius* and *P. (or Lobipes) hyperboreus*, and on that account were thought by some of the older writers to be allied to the Coots (vol. vi. p. 341). The third species is *P. (or Steganopus) wislizeni*. All are natives of the higher parts of the northern hemisphere, and the last is especially American, though perhaps a straggler to Europe.

² There are unfortunately no English words adequate to express these two sections. By some British writers the *Tringina* have been indicated as "Stints," a term cognate with Stunt and wholly inapplicable to many of them, while recent American writers restrict to them the name of "Sandpiper," and call the *Totannina*, to which that name is especially appropriate, "Willetts."

³ It possesses only a single pair of posterior "emarginations" on its sternum, in this respect resembling the RUFF (*supra*, p. 54). Among the *PLOVERS* (vol. xix. p. 227) and *SNIPES* (v.) other similarly exceptional cases may be found.

Dunlin varies considerably in size, and to some extent according to locality, examples from North America being almost always recognizable from their greater bulk, while in Europe, besides the ordinary form, there appears to be a smaller race which has received the name of *T. schnee*, but no other difference is perceptible. In the breeding-season, while performing the amatory flights in which like all Sandpipers he indulges, the male Dunlin utters a most peculiar and far-sounding whistle, quite impossible to syllable, and somewhat resembling the continued ringing of a high-toned but yet musical bell. Next to the Dunlin and Knot the commonest British *Tringinae* are the Sanderling, *Calidris arenaria* (to be distinguished from every other bird of the group by wanting a hind toe), the Purple Sandpiper, *T. strata* or *maritima*, the Curlew-Sandpiper, *T. subarquata*, and the Little and Temminck's Stints, *T. minuta* and *T. temminckii*, but want of space forbids more than the record of their names, and for the same reason no notice can here be taken of the many other species, chiefly American,¹ belonging to this group. Two other birds, however, must be mentioned. These are the Broad-billed Sandpiper, *T. platyrhynchos*, of the Old World, which seems to be more Snipe-like than any that are usually kept in this section, and the marvellous Spoon-billed Sandpiper, *Eurynorhynchus pygmaeus*, whose true home has still to be discovered, according to the experience of Baron Nordenskjöld in the memorable voyage of the "Vega." (A N)

SANDROCOTTUS (CHANDRAGUPTA), founder of the Maurya kingdom in India. See INDIA, vol. xii p. 787, and PERSLA, vol. xvii p. 586.

SANDUSKY, a city of the United States, the capital of Erie county, Ohio, lies at the mouth of Sandusky river, 210 miles by rail north-east of Cincinnati, and is handsomely built of limestone from the subjacent strata on ground rising gradually from the shore of Lake Erie. The court-house and the high school are both of considerable architectural note. Besides being the centre of a great vine-growing district, Sandusky has the largest freshwater fish market in the United States, is the seat of the State fish-hatchery (which annually puts about 3,000,000 young whitefish into the lake), and has attained a reputation for the manufacture of such wooden articles as handles, spokes, "bent work" for carriages, carpenters' tools, &c. The city is coextensive with Portland township. Its population was 13,000 in 1870 and 15,838 in 1880.

SANDWICH, an English borough, market-town, and Cinque Port, is situated in the east of Kent, opposite the Downs, on a branch of the South-Eastern Railway, and on the Stour, 2 miles from the sea, 12 miles east of Canterbury, and 4 north-west of Deal. The streets are narrow and the houses irregularly built. The old line of the walls on the land side is marked by a public walk. The Fishers' Gate and a gateway called the Barbican are interesting, but the four principal gates were pulled down in the last century. St Clement's church has a fine Norman central tower, and St Peter's, said to date from the reign of King John, has interesting mediæval monuments. The grammar school founded by Sir Roger Manwood in 1564 is now in abeyance. There are three ancient hospitals, St Bartholomew's has a fine Early English chapel of the 12th

century. Until the beginning of the 16th century Sandwich was of considerable importance as a port, but after the filling up of the harbour with sand about the beginning of the 16th century it fell into decay. The principal industries of the town are market-gardening, tanning, wool-sorting, and brewing. Coal, timber, and iron are imported. Sandwich returned two members to parliament till 1880, and was merged in the St Augustine's division of the county in 1885. The parliamentary borough, which included Deal and Walmer (area 2684 acres), had in 1881 a population of 15,655, while that of the municipal borough (area 706 acres) was 2846.

In the Norman survey Sandwich is described as a borough. It rose into importance on the decline of the *Pontus Rutupensis*, its name denoting the situation on the sands. The Danes frequently attacked it in the 10th and 11th centuries, and it was repeatedly plundered by the French in the 16th century. It was fortified by Edward VI. Sandwich was incorporated by Edward the Confessor, and received its last charter from Charles II.

SANDWICH, EDWARD MONTAGU, EARL OF (1625-1672), general and admiral, was the son of Sir Sidney Montagu, youngest brother of Edward Lord Montagu of Boughton, and was born 27th July 1625. In August 1643 he raised a regiment in the service of the Parliament, with which he specially distinguished himself at Marston Moor, Naseby, and the siege of Bristol. He was a member of the "Little Parliament" (1653), and one of the committee for regulating the customs. In November he was elected to the council of state. In the first Protectorate parliament he sat for Huntingdonshire. In January 1656 he succeeded Penn as admiral, and he was associated with Blake in his expedition to the Mediterranean in the same year. After the treaty with France against Spain in 1657 he held command of the fleet sent to prevent the relief of the three coast towns—Gravelines, Mardike, and Dunkirk—besieged by the French, and was successful in defeating an attempt by a great Spanish force to retake Mardike. After the death of Cromwell he was sent with a fleet to the North Sea to enter into negotiations with the Northern powers, but, communications having been opened with him on behalf of Charles II., he returned to England only to find that the conspiracy of Sir George Booth had miscarried, whereupon, after a lame explanation, he was dismissed from his command. At the Restoration, having commanded the fleet which conveyed the king to England, he was made Knight of the Garter, and soon afterwards elevated to the peerage as Baron Montagu of St Neots, Viscount Hinchinbroke, and Earl of Sandwich. During the war with the Dutch in 1664-65 he commanded the Blue squadron under the duke of York, and specially distinguished himself in the great battle of 3d June 1665. After his return to England he was sent to negotiate a peace between Spain and Portugal, and also a treaty of commerce with Spain. On a renewal of the war in 1672 he again commanded the Blue squadron under the duke of York, and during the fight in Southwold Bay, on the 28th May, his ship, the Royal James, was set on fire by the Dutch, when he leaped overboard and was drowned. His body was found a fortnight afterwards, and was interred in Henry VII's Chapel, Westminster Abbey.

Lord Sandwich's translation of a Spanish work on the *Art of Metals* by Alvaro Alonso Barba (1640) appeared in 1674. Several of his letters during the Spanish negotiations have been published in *Arlington's Letters*, and various letters to him by Cromwell will be found in Carlyle's *Cromwell*. See also *Original Letters and Negotiations of Sir Richard Fanshawe, the Earl of Sandwich, the Earl of Sunderland, and Sir William Godolphin, when on Diverse Matters between the Three Crowns of England, Spain, and Portugal from 1603 to 1678 are set in a clear light*.

SANDWICH, JOHN MONTAGU, FOURTH EARL OF (1718-1792), was born 3d November 1718, and succeeded

¹ A "Monograph of the *Tringinae* of North America" by Prof Coues was published in the *Proceedings of the Philadelphia Academy for 1861* (pp. 190-205), but is of course new out of date. Schlegel's list of "*Scolopacea*" in the *Museum des Pays-Bas* is the best general description we have, but that is only a few years later (1864), and requires much modification to be put on a level with the knowledge of the present day. The very rare *Tringa leucopetra* of the older systematists, figured by Latham (*Synopsis*, pl. 82), the type of the genus *Proactonotus* of Bonaparte, seems to be really a *Ballus form* (*Comptes Rendus*, xxxi. p. 562 and xliii. p. 598).

his grandfather in the earldom, 20th October 1739. He was educated at Eton and at Trinity College, Cambridge, which he entered in 1755. After a voyage round the Mediterranean, he returned to England and began to take an active interest in politics as a supporter of Sir Robert Walpole. A clear and lucid rather than a brilliant debater, his style of address always won the attention of his audience, and his accurate knowledge secured their respect. The high opinion the Government entertained of his judgment and his diplomatic abilities was evidenced by his appointment in 1746 as plenipotentiary to the congress at Breda, which was continued till peace was negotiated at Aix-la-Chapelle in 1748. On his return he became first lord of the admiralty, retaining the post until June 1751. He held the same office from 1763 to 1765, and again from 1771 till the dissolution of Lord North's administration in 1789. He died 30th April 1792. His *Voyage Round the Mediterranean* was published posthumously in 1799, accompanied with a memoir.

SANDWICH ISLANDS See HAWAIIAN ISLANDS
SANDYS, GEORGE (1577-1644), famous in the reigns of James I. and Charles I. as a traveller and a metrical translator. He was born in 1577, the youngest son of an archbishop of York, studied at St Mary Hall, Oxford, and afterwards probably at Corpus Christi, and began his travels in 1610. The record of them was a substantial contribution to geography and ethnology, written in a style always interesting and often eloquent, interspersed with verified scraps of quotations from classical authors. He travelled from Venice to Constantinople, thence to Egypt, thence by way of Mount Sinai to Palestine, and back to Venice by way of Cyprus, Sicily, Naples, and Rome. Later on in his life he published translations of Ovid's *Metamorphoses*, the first book of the *Æneid*, and various books of Scripture. His verse was praised by Dryden, and deservedly so, for it has vitality as well as a clearly marked rhythm. He died in 1644. Selections from his poetry were published by the Rev H. J. Todd in 1839.

SAN FERNANDO, formerly **ISLA DE LEON**, a fortified city of Spain, in the province of Cadiz, near the head of the inner bay, and $9\frac{1}{2}$ miles by rail from the city of Cadiz (see vol. iv p. 627), is a modern town with straight and level streets, two churches, two hospitals, several barracks, and a school of navigation, with an observatory. It has considerable trade in the salt produced in the neighbouring "salinas." The population within the municipal limits (which include the "poblacion" of San Carlos and the naval arsenal of La Carraca) was returned as 26,346 in 1877.

SAN FRANCISCO, a city of the United States, the largest commercial city of California and of the Pacific coast, is situated in $37^{\circ} 47' 22''$ 55 N. lat. and $122^{\circ} 25' 40''$ 76 W. long., on the end of a peninsula which has the Pacific Ocean on one side and the Bay of San Francisco on the other. The width of this tongue of land within the city limits is about 6 miles, and its whole length about 26. The original site of San Francisco was so uninviting that many of the pioneers doubted if a place of much importance could ever spring up there. The hills (Russian Hill, 360 feet, Telegraph Hill, 294 feet, and a number of others, ranging from 75 to 120 feet) were barren and precipitous, and the interspaces, especially on the westerly side, were made up largely of shifting sand-dunes, on the east side, however, the land sloped gently towards the bay, and there was the further advantage of a small cove extending inland nearly to the present line of Montgomery Street. This cove has since been filled up and built over. After an attempt to found the commercial metropolis at Benicia, 30 miles north on the Straits of Carquinez, it was evident that no other place within easy distance from the ocean possessed so many advantages for the site of a city as this barren

peninsula. The Bay of San Francisco is reached from the ocean through the Golden Gate, a strait about 5 miles long and averaging 1 mile in width, with a depth of 30 feet on the bar at the entrance and from 60 to 100 feet within. The bay, which extends past the city in a south-south-east direction for about 40 miles, is about seven miles wide in front of the city, while its greatest width is 12. Connected with the Bay of San Francisco on the north by a strait 3 miles wide is San Pablo Bay, about 10 miles in length and the same in breadth, having at its extreme northerly end Mare Island, the site of the navy yard. This bay, again, is connected by the Straits of Carquinez with Suisun Bay, 8 miles long and 4 wide. The total length of these bays and connecting straits is 65 miles. This great inland water, sheltered for the most part navigable by the largest craft, receives the two great

Environs of San Francisco

rivers of California, the Sacramento and the San Joaquin. In the Bay of San Francisco are Alcatraz Island (30 acres), strongly fortified, Angel Island (800 acres), fortified, and Yerba Buena, or Goat Island (about 300 acres).

The presidio or fortified settlement of San Francisco was founded on 17th September 1776, and the mission (San Francisco de los Dolores) in the following October. In 1830 the population of the presidio consisted of about fifty Spanish soldiers and officers; these added to the number at the mission made an aggregate population of about 200. Beechy, who visited the harbour and presidio in 1826, has left the following description—

"The governor's abode was in a corner of the presidio, and formed one end of a row of which the other was occupied by a chapel, the opposite side was broken down, and little better than a heap of rubbish and bones, on which jacks, dogs, and vultures were constantly preying. The other two sides of the quadrangle contained stone houses, artificers' shops, and the jail, all built in the humblest style with badly burned bricks and roofed with tiles. The chapel and the Government house were distinguished by being whitewashed."

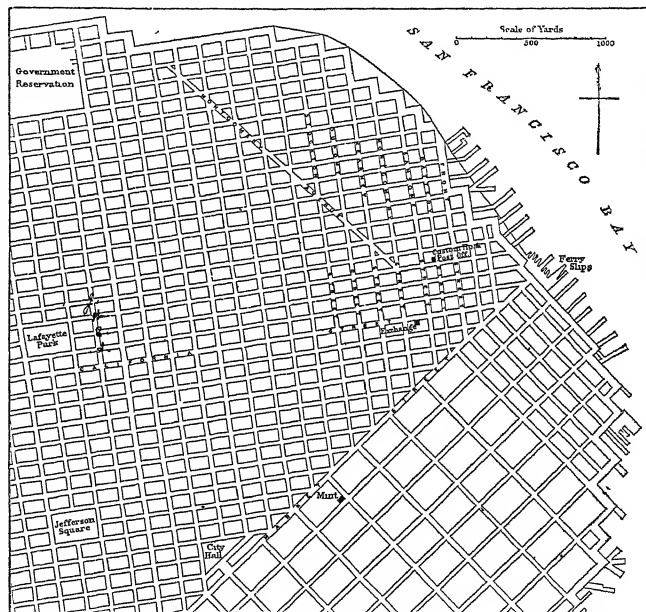

The presidio enclosure was about 300 yards square. In 1834, when it was secularized and began to be known by the secular name of Yerba Buena, the mission Dolores had a population of 500. In the summer of 1846 an American man-of-war took possession of the place. In the early part of 1849 the inhabitants numbered about 2000, and the embryo city had already come to be known by its future name of San Francisco. In consequence of the discovery of gold in California a strong drift of population set in towards the place; and at the end of 1849 there were 20,000 people in the city. The first legislature of California granted a charter to San Francisco on 1st May 1850. Prior to that date the government of the pueblo had been administered by an alcalde. The pueblo grant originally made by the king of Spain contained four square (Spanish) leagues of land, this grant was subsequently confirmed to San Francisco by an Act of Congress. The jurisdiction of the municipality extends over the islands in the bay. The area included in the limits of the city exceeds the original four square leagues considerably, including what were originally denominated "swamp and overflowed lands" (see Dwinelle's *Colonial History*).

In the first stages of its history the buildings of the city were chiefly of wood,—in many cases the frames and coverings having been brought from the Atlantic States round Cape Horn in sailing vessels. Within a few months of the establishment of municipal government the city suffered severely on more than one occasion from fire. The fire of 4th May 1850 destroyed property to the value of about \$3,000,000; another in the following month was still more destructive (\$4,000,000), and the damage resulting from a third in September was estimated at \$500,000.

These occurrences naturally led to the employment of more substantial building material in some cases, granite being imported from China for some buildings, and iron and brick being used to a considerable extent on others, but to this day nearly all the private dwellings of the city are of wood. Since 1850, however, the damage from fire in the portion of the city occupied by private houses has been remarkably small,—partly because of the use of red-wood instead of pine. In the business houses erected recently the increase of solidity and costliness has been very marked.

Throughout a considerable part of the city the streets are laid out in rectangular form, and nowhere with any reference to the natural elevations. The most important business thoroughfare is Market Street, extending from the water front at the ferry landings to the hills on the

west, a distance of 3 miles or more. The more important streets are paved for the most part with cobble stones and basalt blocks, but asphalt on a stone or concrete foundation has begun to be used. Among the public buildings and institutions of San Francisco are the mint, appraisers' stores, subtreasury, custom-house, merchants' exchange, stock exchange, city-hall, industrial school, house of correction, almshouse, Masonic Temple, new Oddfellows' building, safe deposit, and seven theatres and opera-houses. The Palace Hotel cost \$3,250,000, and can accommodate 1200 guests. The city has eleven public squares. Its greatest attraction is the Golden Gate Park of 1050 acres, 3 miles long and half a mile wide, having the ocean for its extreme westerly boundary. The greater part of this area was formerly a shifting sand-dune. An extensive glass-house in a central position is filled with the rarest tropical and semi-

San Francisco (north-eastern part)

tropical plants and shrubs; a large part of the area is planted with forest trees, or is laid down in grass; the walks and drives are well planned and well kept.

San Francisco is traversed in various directions by horse railroads, which extend from the water front to the suburbs. There are also 50 miles of wire cable roads, which are yearly increasing. These cable tramways extend 2 miles on Clay Street, overcoming an elevation of 120 feet. The cost of their construction and equipment has ranged from \$100,000 to \$125,000 per mile. The speed is usually about 5 miles an hour. San Francisco is the terminus of two continental railways, viz., the Union and Central Pacific and the Southern Pacific; while a third, the Atlantic and Pacific, enters the city over a leased line from Mohave. Two narrow-gauge lines and one broad-gauge, each less than a hundred miles long, to

important points in the State, are connected with the city by means of ferries.

The population of San Francisco, as shown by the census returns, was 34,000 in 1850, in 1860, 56,802, in 1870, 149,473, and in 1880, 233,959 (132,608 males, 101,351 females), in 1885 it was estimated, on the basis of the school census, at 275,000 (Chinese, 30,000). At the last presidential election (1884) the total vote cast in the city was 50,167, the total foreign vote being 25,254, of these 12,837 were British (10,206 of them Irish) and 7052 Germans. Of the 90,468 children in the city under seventeen reported for the fiscal year 1884-85, 50,973 had foreign-born parents, and 15,460 more had one parent of foreign origin. In social customs, trade usages, amusements, and religious observances, the large foreign population of San Francisco contributes materially to the formation of its liberal and cosmopolitan character.

Administration.—In 1871 1856 the city and county, which until then had maintained separate governments, were consolidated in one organization. The government is administered by a mayor and a board of twelve supervisors, with the usual offices common to municipal and county organizations. There is also a superior court having twelve departments, with one judge for each, a police court, and justices' courts. The supreme court of the State holds a number of terms each year in San Francisco. The U. S. district and circuit courts also hold regular terms in the city. There is a well-organized and efficient police force of 400 men. On 1st July 1884 the fire department had 315 men. The city is supplied with gas by two companies. Water is supplied by the Spring Valley Company, principally from San Mateo county. The water is brought in three lines of wrought-iron pipe, the largest, which crosses the Crystal Springs reservoir with the pipe, is 14 inches in diameter and 23 miles in length. The daily consumption of water is about 18,000,000 gallons. The company is able to supply 25,000,000 gallons daily.

Finance.—The assessment roll of personal property in 1885 showed a value of \$56,634,890,—that of real estate and improvements being returned at \$171,433,126. The actual value is not less than \$56,000,000. The debt of the municipality is 34 million dollars. These are the principal sources of revenue, and a surplus, with an aggregate paid-up capital of \$21,047,965, and a surplus (1st July 1885) of \$8,945,647. The total assets are set down at \$50,891,972. There are also a number of private banks. These are eight savings banks, all but one of these having some paid-up capital, the aggregate of which is \$1,651,200. These banks on the 1st of July 1885 held deposits to the amount of \$82,577,749, they had a surplus beyond the paid-up capital of \$2,907,208. The banks having a subscribed and paid-up capital pay regular dividends on the entire amount of nominal capital and about 4½ per cent. per annum to depositors.

Commerce.—The exports by water for the fiscal year 1884-85 amounted to \$37,170,800, and the imports to \$37,171,100, the items of import and export by rail being the total up to \$80,000,000. The duties collected on imports were \$6,610,400. The treasure shipped amounted to \$17,746,100, and the exports of merchandise were 14,900 fasks, valued at \$438,800. The receipts of treasure from all productive sources west of the Missouri, including Mexico, reached a total of \$10,253,635, and the coinage at the mint in San Francisco was of the value of \$23,750,000, with an addition of \$1,500,000 on foreign account. The sailing ships entering the port numbered 619 (604, 200 tons); the steamers were 225. Among the imports were—average per vessel from 500 to 800 tons burthen. A. sea-wall is in process of construction by State authority round the deep-water front to prevent the shoaling of the water in the ships resulting in part from the gradual washing down of debris from the hills and steep slopes of the city.

Manufactures.—For many years manufactures made slow pro-

gress. The city was remote from the great centres of population, and labour was very costly. But these disadvantages have been gradually overcome. In 1875 there were 18,000 persons employed in manufacturing establishments, and the value produced was \$40,000,000. In 1885 38,919 persons were so employed, and the estimated value for the business year ending 1st July was \$86,417,200. Subjoined are some of the leading manufactures, with the number of persons employed and the annual value of their production—bags, 300, \$1,500,000, boots and shoes, 8500, \$5,800,000, cigar-boxes, 260, \$5,000,000, wooden boxes, 350, \$1,000,000, brass-foundries, 350, \$585,000, breweries, 450, \$2,450,000, cigars, 8000, \$4,850,000, clothing, 1900, \$3,750,000, coffee and spices, \$900,000, cordage and ropes, 150, \$600,000, crackers, 150, \$620,000, dry docks (stone), 6, \$675,000, flour, 175, \$2,230,000, founries, 2000, \$5,500,000, furs, 170, \$500,000, furniture, 1000, \$2,000,000, gas-works, 460, \$12,000,000, harness, 440, \$1,150,000, jewellery, 165, \$600,000, linseed oil, 55, \$600,000, pickles and fruits, 2000, \$1,700,000, provision-packing, 250, \$1,900,000, rolling-mills, 550, \$1,880,000, sashes, doors, &c., 1550, \$5,010,000, ship-yards, 200, \$503,000, shirts, 2550, \$1,000,000, soap, 180, \$715,100, sugar-refineries, 360, \$3,700,000, tanneries, 335, \$1,700,000, tinwares, 180, \$525,000, woollen-mills, 1500, \$1,900,000. In the laundries, it may be added, 935 whites and 1300 Chinese were employed.

Churches and Charities.—There are 70 Protestant churches in the city, representing nearly all the denominations of the country. Besides these there are 18 Roman Catholic churches and a number of chapels connected with the various hospitals and schools. There are 17 synagogues and 1 Greek church (Russian), including the chapels, the total number of places of worship may be set down at 100. With few exceptions, the church edifices are not imposing. In consequence of the rapid growth of the city wood has been employed in a majority of cases, but this is now being discarded for stone. The asylums and benevolent associations are numerous and well-supported. The more prominent of these institutions are the Protestant Orphan Asylum (214 children), Catholic Orphan Asylum, Pacific Hebrew Orphan Asylum, Magdalen Asylum, Old People's Home, Ladies' Protection and Relief Society, Little Sisters' Infant Shelter, Seamen's Friends Society, San Francisco Benevolent Society, Ladies' United Hebrew Benevolent Society, San Francisco Fruit and Flower Mission, Young Men's Christian Association, Pacific Homeopathic Dispensary, Lying-in Hospital. Besides these there are a great number of associations which are for their members, and some of these have been modelled after the assistance in private hospitals. Nearly all classes of foreign nativity have established benevolent associations, British, French, and German institutions have large resources, and are managed with great efficiency. Nearly all the secret orders (Masonic, Oddfellows, &c.) devoted in whole or in part to works of benevolence are strongly represented.

Schools.—The first public school was established in April 1849. There are now sixty-one free schools, with 43,265 pupils and an average daily attendance of 32,183. The number of children in the city between the ages of five and seventeen years according to the census report of 1880 was 69,000. The number of teachers, male and female, employed in the public school department was 734, the number of schoolhouses 65, and the expenditure for the fiscal year \$517,168. The public schools are graded from the lowest to the highest, and are divided into high schools respectively. Besides the day schools a number of evening schools are provided. There are upwards of 25,000 children who are to a large extent provided with instruction in public and private schools other than those belonging to the free-school department. There are about 100 schools in the city, of all grades, which are supported wholly by fees and voluntary contributions. Of these the Roman Catholics have the greatest number; the latter support two colleges and a number of convent schools. The Protestant denominations also have a number of classical and secondary schools of great excellence. The public-school system of the State culminates in the university of California, which has an aggregate endowment equal to about \$3,000,000. The institution is situated in the beautiful suburban town of Berkeley, on the opposite side of the bay (named in honour of Bishop Berkeley). Instruction is furnished free to all pupils who comply with the terms of admission. There are also a number of professional schools in the city, chief among which are the law, medical, and dental departments of the university, the Cooper Medical College, the Hahnemann Medical College, the San Francisco Theological Seminary, and an art school with an average attendance of about 75 students. The late James Lusk left a bequest of \$540,000 for the endowment of a School of Mechanic Arts, and among other bequests a large one for the University of Sciences, founded in the early period of the city. The public-school department of San Francisco is under the immediate supervision of a superintendent and twelve school directors, one for each ward of the city. There are eighteen public libraries, including the free library with 52,970 volumes. The Mercantile Library Association has 52,000 volumes, the Mechanics'

Institute 33,000, the Oddfellows' Library Association 39,000, and the Law Library 23,355. There is also a rich and extensive State mineralogical collection. (W. C. B.)

SANGALLO, the surname of a Florentine family, several members of which became distinguished in the fine arts.

I **GIULIANO DI SANGALLO** (1443–1517) was a distinguished Florentine architect, sculptor, tarsatore, and military engineer. His father, Francesco di Paolo Giamberti, was also an able architect, much employed by Cosimo de' Medici. During the early part of his life Giuliano worked chiefly for Lorenzo the Magnificent, for whom he built a fine palace at Poggio-a-Cajano, between Florence and Pistoia, and strengthened the fortifications of Florence and Castellana, and other places. Lorenzo also employed him to build a monastery of Austin Friars outside the Florentine gate of San Gallo, a nobly designed structure, which was destroyed during the siege of Florence in 1530. It was from this building that Giuliano received the name of Sangallo, which was afterwards used by so many Italian architects. While still in the pay of Lorenzo, Giuliano visited Naples, and worked there for the king, who highly appreciated his services and sent him back to Florence with many handsome presents of money, plate, and antique sculpture, the last of which Giuliano presented to his patron Lorenzo, who was an enthusiastic collector of works of classic art. After Lorenzo's death in 1492, Giuliano visited Loreto, and with great constructive skill built the dome of the church of the Madonna, in spite of serious difficulties arising from its defective piers, which were already built. In order to gain strength by means of a strong cement, Giuliano built his dome with pozzolana brought from Rome. Soon after this, at the invitation of Pope Alexander VI, Giuliano went to Rome, and designed the fine panelled ceiling of S. Maria Maggiore. He was also largely employed by Julius II, both for fortification walls round the castle of S. Angelo, and also to build a palace adjoining the church of S. Pietro in Vincoli, of which Julius had been titular cardinal. Giuliano was much disappointed that Bramante was preferred to himself as architect for the new basilica of St. Peter, and this led to his returning to Florence, where he was warmly received by the gonfaloniere Pier Soderini, and did much service to his native state by his able help as a military engineer and builder of fortresses during the war between Florence and Pisa. Soon after this Giuliano was recalled to Rome by Julius II, who had much need for his military talents both in Rome itself and also during his attack upon Bologna. For about eighteen months in 1514–1515 Giuliano acted as joint-architect to St. Peter's together with Raphael, but owing to age and ill-health he resigned this office about two years before his death in 1517. But little remains to enable one to judge of Giuliano's talents in the artistic side of his profession, the greater part of his life was spent on military works, in which he evidently showed great skill and practical knowledge of construction.

II **ANTONIO DI SANGALLO** (1448–1534) was the younger brother of Giuliano, and took from him the name of Sangallo. To a great extent he worked in partnership with his brother, but he also executed a number of independent works. As a military engineer he was as skilful as Giuliano, and carried out important works of walling and building fortresses at Arezzo, Montefiascone, Florence, and Rome. His finest existing work as an architect is the church of S. Biagio at Montepulciano, in plan a Greek cross with central dome and two towers, much resembling, on a small scale, Bramante's design for St. Peter's. He also built a palace in the same city, various churches and palaces at Monte Sansavino, and at Florence a range of monastic buildings for the Servite monks.

Antonio retired early from the practice of his profession, and spent his latter years in farming.

III **FRANCESCO DI SANGALLO** (1493–1570), the son of Giuliano di Sangallo, was a pupil of Andrea Sansovino, and worked chiefly as a sculptor. His works have for the most part but little merit,—the finest being his noble effigy of Bishop Leonardo Bonafede, which lies on the pavement of the church of the Certosa, near Florence. It is simply treated, with many traces of the better taste of the 15th century. His other chief existing work is the group of the Virgin and Child and St. Anne, executed in 1526 for the altar of Or San Michele, where it still stands.

IV **BASTIANO DI SANGALLO** (1481–1551), Florentine sculptor and painter, was a nephew of Giuliano and Antonio. He is usually known as *Aristotile*, a nickname he received from his air of sententious gravity. He was at first a pupil of Perugino, but afterwards became a follower of Michelangelo. His life is given at great length by Vasari, in spite of his being an artist of very mediocre powers.

V **ANTONIO DI SANGALLO**, the younger (1–1546), another nephew of Giuliano, went while very young to Rome, and became a pupil of Bramante, of whose style he was afterwards a close follower. He lived and worked in Rome during the greater part of his life, and was much employed by several of the popes. His most perfect existing work is the brick and travertine church of S. Maria di Loreto, close by Trajan's column, a building remarkable for the great beauty of its proportions, and its noble effect produced with much simplicity. The lower order is square in plan, the next octagonal, and the whole is surmounted by a fine dome and lofty lantern. The lantern is, however, a later addition. The interior is very impressive, considering its very moderate size. Antonio also carried out the lofty and well-designed church of S. Giovanni dei Fiorentini, which had been begun by Jacobo Sansovino. The east end of this church rises in a very stately way out of the bed of the Tiber, near the bridge of S. Angelo, the west end has been ruined by the addition of a later facade, but the interior is a noble example of a somewhat dull style. Great skill has been shown in successfully building this large church, partly on the solid ground of the bank and partly on the shifting sand of the river bed. Antonio also built the Cappella Paolina and other parts of the Vatican, together with additions to the walls and forts of the Leonine City. His most ornate work is the lower part of the cortile of the Farnese palace, afterwards completed by Michelangelo, a very rich and well-proportioned specimen of the then favourite design, a series of arches between engaged columns supporting an entablature, an arrangement taken from the outside of the Colosseum. A palace in the Via Giulia built for himself still exists under the name of the Palazzo Sacchetti, but is much injured by alterations. Antonio also constructed the very deep and ingenious rock-cut well at Orvieto, formed with a double spiral staircase, like the well of Saladin in the citadel of Cairo.

For other architects called Sangallo who lived during the 16th century see *Raviochi, Notizie sui lavori . . . dei nomi Da San Gallo*, Rome, 1860. (J. H. M.)

SANGERHAUSEN, an ancient town of Prussian Saxony, is situated on the Gonna, near the south base of the Harz Mountains, and 30 miles to the west of Halle. In 1880 it contained 9136 inhabitants, chiefly occupied in the manufacture of beetroot sugar, machinery, buttons, &c., in agriculture, and in the coal and copper mines of the neighbourhood. Sangerhausen is one of the oldest towns in Thuringia, being mentioned in a document of the 10th century. The Romanesque church of St. Ulrich is said to have been founded by Lous the "Springer," margrave of Thuringia, in 1079.

SANTATION. See HYGIENE AND SEWAGE

SAN JOSÉ, the capital of Costa Rica, Central America, stands 3900 feet above the sea, in a beautiful valley surrounded by mountains, on the west side of the main range about 15 miles north-west of Cartago (the ancient capital), with which it is connected by a railway (1884). Since 1870 the cathedral has been restored, a handsome marketplace with offices for the municipality erected, the barracks rebuilt and fortified, and several of the streets macadamized. San José is the seat of the national bank (founded in 1873) and of a university, to which a medical school and a museum are attached. The population is estimated at from 20,000 to 25,000. As a city it dates from the latter half of the 18th century, it became the capital after the destruction of Cartago by earthquake in 1841.

SAN JOSÉ, a city of the United States, capital of Santa Clara county, California, lies 40 miles south-east of San Francisco and 8 miles from the southern end of San Francisco Bay, in the heart of the beautiful Santa Clara Valley. It is at this point that the railways from the two sides of the bay meet. The main part of the city occupies a gently rising plateau between the Coyote and Guadalupe rivers. Among the principal buildings are a fine courthouse, a theatre, a city-hall, two markets, a music-hall, the State normal school, the Methodist "university of the Pacific," and a number of large colleges and schools. Besides three public parks in the city San José possesses a tract of 400 acres in Pentencia Cañon, 7 miles east, reserved for a similar purpose. The Lick Observatory (founded in 1884 on the top of Mount Hamilton) is 12 miles distant, and the Almaden quicksilver mines about 14 miles. The population of the city was 9089 in 1870, and 12,567 (township 18,103) in 1880.

Founded by the Spanish missionaries in 1777, San José remained a small village of adobe huts till the annexation of the country to the United States. The first session of the legislature of California was held in the town in 1848-50.

SAN JUAN BAUTISTA. See PORTO RICO

SAN JUAN DE LA FRONTERA, the capital of a province of the Argentine Republic, is situated 2810 feet above the sea in a great bend of the Rio do San Juan, 95 miles north of Mendoza and 730 miles from Buenos Ayres, with which it is about to be connected by rail (1886). It is mostly built of sun-dried bricks, has a cathedral, several churches and schools, two banks, and a botanical garden, and carries on a considerable trade with Chili by the Patos and Uspallata passes. Population estimated at 20,000 (1881).

San Juan was founded in 1561 by Captain Castillo on a site 4 miles to the north, which had to be abandoned owing to inundations and is now called Pueblo Viejo. From 1778 to 1820 the city was in the government of Mendoza. President Sarmiento bestowed special attention on this his native town and gave his name to its principal school, famous throughout the republic for its excellent equipment.

SAN JUAN DEL NORTE. See GREYTOWN

SAN JUAN (or HARO) ISLANDS, an archipelago (San Juan, Orcas, Shaw, Lopez, Blakely, Cypress, &c.) lying between Vancouver Island and the mainland of North America, which were for many years the subject of dispute between the British and the United States Governments, and were finally assigned to the latter country by the arbitration of the emperor of Germany (21st October 1872). Geographically the cluster certainly belongs to the mainland, from which it is separated by Rosario Channel, generally much under 50 fathoms in depth, while Haro Strait, separating it from Vancouver Island, has depths ranging from 100 to 180 fathoms. In 1873 the islands, formerly considered part of Whatcom county, Washington Territory, were made the separate county of San Juan. Of the total area of 200 square miles, about 60 are in San

Juan, 60 in Orcas, and 30 in Lopez. The population was 554 in 1870 and 948 in 1880.

See *Pape's relating to the Treaty of Washington*, vol v, 1872, and the map in Petermann's *Mittheilungen*, 1873.

SANKT JOHANN See SAARBRUCKEN

SANKT POLTEN, a small town, and the seat of a bishop, in Lower Austria, is situated on the Treisen, a tributary of the Danube, 61 miles west of Vienna by rail. It contains an interesting old abbey church, founded in 1030 and restored in 1266 and again at the beginning of the 18th century. There are several religious educational institutions in the town, and a military academy for engineers. The inhabitants, 10,015 in number, carry on some trade, and the manufacture of iron wire, paper, weapons, &c. The name is said to be a corruption of Traisma ad S Hippolytum, from a convent that formerly stood here. The history of the bishopric has been written in two volumes by Kerschbaumer (Vienna, 1875-6).

SAN LUCAR DE BARRAMEDA, a town of Spain, in the province of Cadiz, and 27 miles by sea from that city, in a bare, sandy, and undulating country, on the left bank of the Guadalquivir, not far from its mouth. It stands partly on the flat bank of the river and partly on the rising ground behind, the summit of which is crowned by an old Moorish castle. There is an old parish church dating from the 14th century. The other buildings have no special interest, and the place as a whole is dull and lifeless, having lost much of the commercial importance it formerly possessed. It is now chiefly dependent on the trade in its wines, which is still considerable. Many of the inhabitants are employed in agriculture and fishing. The population within the municipal boundaries was 21,918 in 1877.

SAN LUIS POTOSI, a city of Mexico, capital of the state of the same name, is situated at a height of 6200 feet on the eastern edge of the great plain of Anahuac, in a valley running north and south, 160 miles north-west of Queretaro. It is a great centre for the "diligence" traffic, and in 1885 was connected by rail with Tampico, a promising harbour on the Gulf of Mexico. The city proper, which has a rather imposing Oriental appearance, is laid out with great regularity, the streets are well-paved, and the houses, usually two stories in height, are frequently fine specimens of old Spanish architecture. But suburbs of wretched hovels spread over a considerable area. Among the conspicuous buildings are the cathedral, the Government house, with a front in rose-coloured stone, the city-hall, the mint, the churches of El Carmen, San Francisco, &c., and the recently erected "American" hotel, which, with tramways, telephones, and electric light, is a symptom of the Occidentalizing that is rapidly taking place in the inland cities of Mexico. The Instituto Científico is a kind of university for the teaching of law, medicine, and the exact sciences. Plaza Hidalgo takes its name from the statue to the martyr of Mexican independence. A considerable trade is carried on in cattle, hides, and tallow. The population is stated at 30,000, or with the suburbs 60,000.

Founded in 1586, San Luis Potosi has played an important part in the Mexican civil wars. In 1863 it was the seat of the national government under Juárez, and after being occupied by Bazaine was recovered by Juárez in 1867.

SAN MARINO, the smallest independent republic in Europe, has an area of 33 square miles (Strelbitsky), lies between the provinces of Forlì and Pesaro-Urbinò, and consists of part of the eastern spurs of the Apennines Monte Titano, the central and culminating summit, has three peaks (M. Guaita, Cucco, and Gista), the three *Penne* of San Marino—a name evidently identical with the Celtic Penn or Benn, but translated by the canting heraldry of the republic's coat of arms as three "feathers." The two

streams (Marecchia and Ausa) which pass through Rimini to the sea have their head-waters partly in the north and west of San Marino, while its south-eastern valleys are drained by the sources of the Marano. Farming and stock-raising occupy the bulk of the population (total, 5700 in 1850, 7816 in 1874), and their wines and oxen are both highly prized. The city of San Marino (1600 inhabitants), formerly reached only by a mule-track but since 1875 by a good carriage-road, is a quaint little place with steep and narrow streets and picturesque but gloomy houses of undressed stone, and containing five churches, a council-hall, an audience chamber, a law court, a little theatre, a museum, and a library. In the centre of the principal square (Pannello) stands a white marble statue of Liberty, presented by the duchess of Acquaviva. At the foot of the city-hill lies the Borgo di San Marino (the commercial centre of the republic), and other municipal villages are Serravalle, Faetano, and Montegiardino, each with remains of its castle and fortifications.

The republic is governed by a great council (*Generale-Consiglio-Principe*) of 60 members (20 nobles, 20 burghers, 20 rural land-owners) named for life by the council itself. From this body is elected the Council of Twelve, which with the assistance of a legal adviser decides in the third and last resort. Two captains-regent elected every six months (one from the nobles, one from the other two classes) represent the state, which also has its home secretary, its minister of foreign affairs, its chancellor of the exchequer, an army of 950 men, and a regular budget. By treaty with Italy (1872) San Marino, instead of maintaining a customs line of its own, receives a certain proportion of the Italian customs revenue, and, agreeing not to grow tobacco, is allowed to purchase foreign tobacco duty free. To avoid any difficulty about copyright there is no printing press in the republic.

San Marino derives its name from a certain Dalmatian mason who, along with a comrade immortalized by the neighbouring castle and cathedral of St. Leo in Lucca, in the 13th century, 3d century. The bones of Marinus are said to have been removed to Pavia by the Lombard king Astolphus and restored to the little city on Mount Titanus by Pippin, but the first authentic document proving the existence of the community dates from 885. Situated as a bulwark between the hostile houses of Montefeltro and Malatesta, San Marino fortunately attached itself to the stronger party, which in the 15th century placed its representative on the ducal throne of Urbino. The assistance which it rendered Duke Federico and his allies, the king of Naples and the pope, against Sigismondo Malatesta was rewarded in 1463 with the castles and territories of Serravalle, Faetano, and Montegiardino. On the annexation of Urbino to the States of the Church (1621), the independence of San Marino was acknowledged, and the unauthorized assertion of papal jurisdiction by Alberton in 1789 was disavowed by Clement XII on February 6th 1740. In 1797 Napoleon I decided to preserve this "colonie de la république," and in 1854 it was protected from the designs of Pius IX by the interference of Napoleon III. At the unification of Italy, Cibrario, a citizen in the service of the house of Savoy, helped to secure excellent terms for San Marino.

See Melchiorri Deleoni, *Memorie storiche di San Marino*, Marino Faetani, *Regione storica di San Marino*, St. Angelo, 1879, and *St. Angelo, A. F. of Freedom*, 1879, Casati, *La repubblica di San Marino*, Milan, 1881.

SAN MARTIN DE JOSÉ (1778-1850), Chilean general, was born at Yapey, on the Uruguay river, February 25, 1778. In his eighth or ninth year he accompanied his own family to Spain for his education, and being intended for the military profession was admitted into the college of nobles at Madrid. He saw active service and gained distinction in the war of independence, and had risen to the rank of lieutenant-colonel when in 1811 he returned to La Plata. Entering the service of the insurgents there he was entrusted with raising a troop of cavalry, and afterwards was appointed to the chief command of the army acting in Upper Peru against the forces of the viceroy of Lima. After re-establishing his health at Cordova in 1814, he proceeded in 1815 to take command of Cuyo, where he organized an expedition for the liberation of Chili (see vol. v p 618). He crossed the mountains early in 1817, and, after gaining a brilliant victory at Chacabuco on 12th February, was pressed by the people of Chili to take the supreme command, and gained a still more brilliant victory at Maipú, 5th April 1818. After organizing the govern-

ment of Chili he sailed with the squadron under Lord Cochrane for Peru, 21st August 1820, and, capturing Lima, drove the Spaniards from the coast and assumed the title of "Protector" of Peru in 1821, but resigned it a year afterwards, and, sailing secretly for Europe, spent the remainder of his life in absolute seclusion near Paris. He died at Boulogne, 17th August 1850.

See *Biographical Sketch* of General San Martín attached to *Peruvian Pamphlet*, being an exposition of the *Administrative Labours of the Peruvian Government*, 1823.

SANMICHELE, MICHELE (1484-1559), one of the ablest architects of his time, learnt the elements of his profession from his father Giovanni and his uncle Bartolommeo, who both practised as architects at Verona with much success. Like almost all the enthusiastic students of that time he went at an early age to Rome to study classic sculpture and architecture. His great talents soon became known, and he designed and carried out a very large number of works at Verona, Venice, and other places. Among his earliest are the duomo of Montefascone (an octagonal building surmounted with a cupola), the church of San Domenico at Orvieto, and several palaces at both places. He also executed a fine tomb in S. Domenico.¹ He was no less distinguished as a military architect, and was much employed by the signoria of Venice, not only at home, but also in strengthening the fortifications of Corfu, Cyprus, and Candia.² One of Sanmichele's most graceful designs is the Cappella de' Peregrini in the church of S. Bernardino at Verona—square outside and circular within, of the Corinthian order.³ He built a great number of fine palaces at Verona, five of which still exist, as well as the graceful Ponte Nuovo. His last work, begun in 1559, was the round church of the Madonna di Campagna, a mile and a half from Verona on the road to Venice. Like most other distinguished architects of his time he wrote a work on classic architecture, *La Cinque Ordini dell' Architettura*, printed at Verona in 1735. Sanmichele to some extent followed the earlier style of Brunelleschi, his work is always refined and his detail delicate. His chief pupil was his nephew Bernardino.

See Rouzau and Lucicelli, *Fabbriche di M. Sanmichele*, Venice, 1832, and Selva, *Biogio di Sanmichele*, Rome, 1814.

SAN MIGUEL (S. SALVADOR), or **ST MICHAEL'S**. See AZORES, vol. iii p. 171.

SANNAZARO, JACOPO (1458-1530), one of the poets of the Renaissance in Italy, was born in 1458 at Naples of a noble family, said to have been of Spanish origin, which had its seat at San Nazaro near Pavia. His father died during the boyhood of Jacopo, who was accordingly brought up in a very plain way at Nocera Inferiore. He afterwards studied at Naples under Pontanus, when, according to the fashion of the time, he assumed the name Actius Sincerus, by which he is occasionally referred to. After the death of his mother he went abroad,—driven, we are told, by the pangs of despised love for a certain Carmosina, whom he has celebrated in his verse under various names, but of the details of his travels nothing is recorded. On his return he speedily achieved fame as a poet and place as a courtier, receiving from Frederick III. as a country residence the Villa Mergellina near Naples. When his patron was compelled to take refuge in France in 1501 he was accompanied by Sannazaro, who did not return to Italy till after his death (1504). The later years of the poet seem to have been spent at Naples without interruption or memorable incident. He died on April 27, 1530.

The *Arcadia* of Sannazaro, begun in early life and published in 1504, is a somewhat affected and insipid Italian pastoral, in which

¹ See Della Valle, *Storia del Duomo di Orvieto*, Rome, 1791.

² See Bartoldi, *Sanmichele al servizio della repubblica Veneta*.

³ See Guliani, *Cap de Peregrini*, Verona, 1816.

in alternate prose and verse the scenes and occupations of pastoral life are described. His now seldom read Latin poem *De Partu Verginis*, which gained for him the name of the "Christian Virgil," appeared in 1526, and his collected *Sonetti e Canzoni* in 1530.

SAN REMO, a town and seaport of northern Italy, at the head of a circondario in the province of Porto Maurizio on the Western Riviera, 16½ miles by rail east of Mentone and 84½ south-west of Genoa. Climbing the slope of a steep hill, it looks south over a small bay of the Gulf of Genoa, and, protected towards the north by hills rising gradually from 500 to 8000 feet, has the reputation of being in climate one of the most favoured places on the whole coast. The narrow star-like streets of the old town, with their lofty houses, arched gateways, and flying buttresses, form a fine contrast to the modern districts of villas and hotels which have sprung up since about 1800. Besides the Gothic cathedral of San Siro, the buildings of most interest are the Madonna della Costa, crowning the highest part of the old town, the town-house, and the hospital for cutaneous diseases founded by Charles Albert. The port, formed by two moles, both lengthened since 1880, was at one time much more important, its annual movement having sunk from about 1000 in 1866 to 383 small vessels in 1884. The population of the commune (10,012 in 1861) was 16,055 in 1881,—12,285 in the city proper, and 1717 in the suburbs Poggio and Verizzo.

San Remo, identified by Girolamo Rossi (*Storia della Città*) with a Greek Leucothea and a Roman Matatia, was Christianized by St. Ormasda and his pupil St. Siro. Rebuilt after the expulsion of the Saracens from Liguria, it took the name of San Romolo from its 6th-century bishop whose death-day, 13th October, is still a local fête. In what way Romulus was supplanted by Remus is not clearly ascertained. In 1544 the town was attacked by Barbarossa, and in 1626 by the French and Savoyards. The Genoese, against whose encroachments it had long defended its independence, subjected it in 1763, and in 1797 it was incorporated in the district of Palmes of the Ligurian republic.

SAN SALVADOR, or SALVADOR (*República del Salvador*), the smallest but most densely peopled of the republics of Central America, has a coast-line of 160 miles along the Pacific from the mouth of Rio de la Paz to that of the Goascoran in the Gulf of Fonseca, and is bounded inland by Guatemala on the west and Honduras on the north and east. Its length from east to west is 140 miles, and its average breadth about 60 miles. Its area is estimated at 7225 square miles, and in 1883 it contained 613,273 inhabitants (290,870 males, 323,403 females). With the exception of a comparatively narrow seaboard of low alluvial plains, the country consists mainly of a plateau about 2000 feet above the sea, broken by a large number of volcanic cones, geologically of more recent origin than the main chain of the Cordillera which lies farther to the north. The principal river of the republic is the Rio Lempa, which, rising near Esquipulas in Guatemala and crossing a corner of Honduras, enters Salvador north of Citalá. After receiving from the right the surplus waters of the Laguna de Cuyá, a vast lake belonging partly to Guatemala and partly to Salvador, it flows for nearly a degree of longitude eastward through a magnificent and luxuriant valley between the plateau and the Cordillera, and then turning somewhat abruptly south skirts the base of the volcano of Siguatepeque and reaches the Pacific in 88° 40' W. long. Among its numerous tributaries are the Rio Santa Ana, rising near the city of that name, the Asaguate, which passes the capital San Salvador, the Sumpul, which forces its way like the Lempa itself athwart the mountains from Honduras, and the Torola, draining the north-eastern corner of Salvador and part of Honduras. The Lempa is even in the dry season a considerable river with a rapid current, and for two-thirds of its course it could easily be made navigable for steamers. The Rio San Miguel drains the country

between the Gulf of Fonseca and the basin of the Lempa. The volcanic mountains do not form a chain but a series of clusters—the Izalco group in the west—including Izalco (formed in 1770), Marcelino, Santa Ana, Naranjos, Aguila, San Juan de Dios, Apaneca, Tamajaso, and Lagunita, the San Salvador group, about 30 miles to the east, Coatepeque to the north-east and the San Vicente group to the east of the great volcanic lake of Ilopango, the Siguatepeque summits to the north-east of San Vicente, and the great south-eastern or San Miguel group—San Miguel, Chinameca, Buenapá, Usulután, Tecapa, Taburete, Caca-guateque and Sociedad volcanoes in the north-east belong to the inland Cordillera.

The volcanic forces in Salvador have not as yet spent themselves. The Izalco vent still acts as a safety valve, and the neighbourhood of the capital is so subject to hemblings and rockings of the earth as to have acquired the name of the swinging mat or hammock. The city itself has been destroyed by earthquake in 1594, 1668, in 1719, and in 1854. San Miguel is described as one of the most treacherous burning mountains in America, sometimes several years in complete repose and then all at once bursting out with terrific fury (Schaezer). In 1879–1880 the Lake of Ilopango was the scene of a remarkable series of phenomena. With a length of 5½ miles and a breadth of 4½, it forms a rough parallelogram with deeply indented sides, and is surrounded in all directions by steep mountains except at the points where the villages of Santo and Apulo occupy little patches of level ground. Between 31st December 1879 and 11th January 1880 the lake rose four feet above its level. The Jiboa, which flows out at the south-east corner, became, instead of a very shallow stream 20 feet broad, a raging torrent which soon scooped out for itself in the volcanic rocks a channel 30 to 35 feet deep. A rapid subsidence of the lake was thus produced, and by the 6th of March the level was 34½ feet below its maximum. Towards the centre of the lake a volcanic cone about 500 feet in diameter rose 150 feet above the water, surrounded by a number of small islands. A number of villages were ruined by the accompanying earthquakes. The lake, originally stocked by the early Spanish settlers, had become the great fish-pond of the republic. On the outbreak of the volcanic forces, the fish fled towards the sides, and on the receding of the waters their dead bodies were left behind in such numbers that a score of three hundred men were employed for days burying them to avoid a pestilence.

It is less to these natural catastrophes than to political instability that the comparative backwardness of Salvador to develop its resources of soil and minerals must be ascribed, and considerable progress has in many respects been made since the middle of the century. Coffee now is the principal export (the value of \$1,056,000 in 1873, \$3,416,104 in 1883). Indigo, for a long time the staple of the country and exported to the annual value of \$20,000,000, is still extensively cultivated (exports in 1883 \$1,812,594). As this indigo is generally quoted in the market as Guatemalan, so another valuable product of Salvador is always designated Balsam of Peru (see vol. p. 298), though the tree from which it is obtained grows naturally nowhere else in the world except in a limited part of the Salvador seaboard, known as the Balsam coast. It was exported in 1883 to the value of \$33,612. Other productions of less importance are tobacco, sacapilla, india-rubber, and sugar. The silver mines have been and may again be of some account, and coal has been discovered inland. On the whole the trade of the country has greatly increased the imports and exports, \$1,506,378 and \$1,941,650 respectively in 1869, were \$5,401,463 and \$5,861,053 in 1883. At the time of Dr. Sánchez's visit there was a fine canal in the country, there are now a considerable number of good iron bridges on the new roads between the principal cities. The first railway, that from Acajutla to Sonsonate (15 miles) was opened in 1882, and has since been continued in the direction of Santa Ana, the chief commercial town. Telegraphic communication has been established between the more important towns, and in July 1882 the Central and North American Company landed its cable at La Libertad, Acajutla, La Libertad, and La Unión, or San Carlos de la Unión (in the Gulf of Fonseca) are the principal harbours. Besides the capital San Salvador, with 14,059 inhabitants, there were in 1878, according to the census, 68 places in the republic with over 2000 each—Santa Ana (22,006), Nahzualeo (9988), San Vicente (9967), San Miguel (9842), Metapan (9782), Chichuapá (8171), Ahuahapán (7880), Nuevo San Salvador (7837), &c. There are three universities—San Salvador, Santa Ana, and San Miguel, with funds partly provided by a quarter of the customs—a girls' college at Santa Ana, and a fair number of secondary and primary schools. Salvador received this name from Pedro Alvares, who, when he conquered it for Spain in 1525–26, found it a rich and populous country. Its independence of the Spanish

crown dates from 1842, in 1853 it obtained the constitution under which (in a modified form) it now exists as a sovereign state General Barrios, having in 1858 obliged the president Santín del Castillo to abdicate, secured his own permanent appointment to the office in 1860, but in 1863-4 he failed in his endeavour to defend his capital against the Guatemalans, and when he returned in 1864 to attack Duesás, the Guatemalan protégé, he was defeated and put to death "Pronunciamientos" have since been the two general preliminaries of presidential elections, but there has been no serious war, and the finances of the republic have usually a balance on the right side

See Scherrei, *Tratado de Central America* (1857). Sonnenstern, *Descrípção del estado del Salvador* (New York, 1859, with a good map reproduced in Berlin *Zeitsch für Geographie*, 1860). SANSANDING, or **SANSANDIG**, a town in the interior of Western Africa, on the north bank of the Niger, in 13° 40' N. lat. and 6° 25' W. long. and included in the "empire" of Segu It was visited by Mungo Park in 1796, and in 1865 by Mage and Quintin, who witnessed the stand it made against a siege by Ahmedu, sultan of Segu, from whom it had revolted The population is estimated at 30,000 to 40,000.

SAN SEBASTIAN, a seaport of Spain, capital of the province of Guipuzcoa, 42 miles north-north-west of Pamplona, and 402 miles by rail from Madrid It occupies a narrow isthmus, terminated towards the north by a lofty conical rock called Urgull or Orgullo, and flanked on its eastern side by the river Urumea, here crossed by a bridge, and on the other by a bay (La Concha), which forms the harbour The summit of the hill is crowned by a fort (Castillo de la Mota), and the landward side of the town was formerly defended by solid ramparts.

The houses are almost all modern, built uniformly in straight streets and regular squares, so as to present an appearance quite unlike most Spanish towns There are two large churches, a court-house, a theatre, hospitals, barracks, &c. The manufactures of the place are insignificant; and the harbour is small, and not easily accessible, though well protected by a mole and small island. There is a considerable trade in English and French goods,—corn and other articles being exported During summer the town is much frequented, especially by the wealthier inhabitants of Madrid, for sea-bathing, and tent-like huts are set up for the purpose on the shore of the bay. From its position and strength San Sebastian has been long a place of much importance, and has sustained several sieges. The most memorable of these was in August 1813, when the British, under Wellington, took it by storm. The population within the municipal boundaries was 21,355 in 1877

SAN SEVERO, a city of Italy, in the province of Foggia, and at one time the chief town of the Capitanata, lies at the foot of the spurs of Monte Gargano, and has a station on the railway to Brindisi, 36 miles south-east of Termoli and 17 north of Foggia It is the see of a bishop (since 1580), and has a handsome cathedral and some remains of its old fortifications In 1880 the population was 19,756 (20,382 in commune)

San Severo dates from the Middle Ages It was laid in ruins by Frederick II., and in 1053 was the scene of a victory by Robert Guiscard over the papal troops under Leo IX The overlordship was held in succession by the Benedictines of Torre Maggiore abbey, the Knights Templars, the crown of Naples, and the Sangro family (commendataries of Torre Maggiore) In 1627, and again in 1828 and 1851, the town suffered from earthquakes.

SANSKRIT LANGUAGE AND LITERATURE

PART I.—SANSKRIT LANGUAGE.

SANSKRIT is the name applied by Hindu scholars to the ancient literary language of India. The word *samskrita* is the past participle of the verb *kar*, "to make" (cognate with Latin *creo*), with the preposition *sam*, "together" (cog. *σύν*, *σύνος*, Eng. "same"), and has probably to be taken here in the sense of "completely formed" or "accurately made, polished,"—some noun meaning "speech" (esp. *bhāṣā*) being either expressed or understood with it The term was, doubtless, originally adopted by native grammarians to distinguish the literary language of the educated classes from the uncultivated popular dialects—the forerunners of the modern vernaculars of northern India—which had, from an early period, developed side by side with it, and which were called (from the same root *kar*, but with different prepositions) *Prākṛita*, &c, either "derived" or "natural, common" forms of speech. But this designation of the literary idiom, being evidently intended to imply a language regulated by conventional rules, also involves a distinction between the grammatically fixed language of Brāhmanical India and an earlier, less settled, phase of the same language exhibited in the Vedic writings For greater convenience the Vedic language is, however, usually included in the term, and scholars generally distinguish between the Vedic and the classical Sanskrit. The Sanskrit language, with its old and modern descendants, represents the easternmost branch of the great Indo-Germanic, or Aryan, stock of speech Philological research has clearly established the fact that the Indo-Aryans must originally have immigrated into India from the north-west. In the oldest literary documents handed down by them their gradual advance can indeed be traced

from the slopes of eastern Kabulistan down to the land of the five rivers (Punjab), and thence to the plains of the Yamunā (Jumna) and Gangā (Ganges) Numerous special coincidences, both of language and mythology, between the Vedic Aryans and the peoples of Iran also show that these two members of the Indo-Germanic family must have remained in close connexion for some considerable period after the others had separated from them.

The origin of comparative philology dates from the time when European scholars became accurately acquainted with the ancient language of India. Before that time classical scholars had been unable, through centuries of learned research, to determine the true relations between the then known languages of our stock. This fact alone shows the importance of Sanskrit for comparative research. Though its value in this respect has perhaps at times been overrated, it may still be considered as the eldest daughter of the old mother-tongue. Indeed, so far as direct documentary evidence goes, it may rather be said to be the only surviving daughter, for none of the other six principal members of the family have left any literary monuments, and their original features have to be reproduced, as best they can, from the materials supplied by their own daughter languages. such is the case as regards the Iranian, Hellenic, Italic, Celtic, Teutonic, and Letto-Slavic languages To the Sanskrit the antiquity and extent of its literary documents, the transparency of its grammatical structure, the comparatively primitive state of its accent system, and the thorough grammatical treatment it has early received at the hand of native scholars must ever secure the foremost place in the comparative study of Indo-Germanic speech.

Alphabet. The Sanskrit alphabet consists of the following sounds —

(a) Fourteen vowels, viz —

Ten simple vowels *a, ā, i, ī, u, ū, r, ṛ, ṝ, ṝ̄*, and

Four diphthongs *ai, ei, oi, au*

(b) Thirty-three consonants, viz —

Five series of mutes and nasals.

Guttural *ka, kh, ga, ṅa*

Palatal *ca, ch, ja, ṇa*

Lingual *ta, th, da, ṇa*

Dental *ta, th, da, ṇa*

Labial *ba, bh, ma, ṇa*

Four semivowels *y, v, w, ṣ*

Three sibilants *ś, ṣ, h*, lingual *ṣ, dental s*, and

A soft aspirate *h*

(c) Three unoriginal sounds, viz —

śaṇḍa (*ṣ*), a hard aspirate, standing mostly for original *ś* or *ṣ*, and two nasal sounds of less close contact than

the mutes-nasals, viz, *anusvāda* (*m*) and *anandāda* (*m*)

Vowels

As regards the vowels, a prominent feature of the language is the prevalence of *a*-sounds, these being about twice as frequent as all the others, including diphthongs, taken together (Whitney)

The absence of the short vowels *i* and *u* from the Sanskrit alphabet, and the fact that Sanskrit shows the *a*-vowel where other vowels appear in other languages,—*g*, *gharantam* = *gharānta*, *ferentem*, *garvas* = *garhos*, *genus*,—were formerly considered as strong evidence in favour of the more primitive state of the Sanskrit vowel system as compared with that of the sister languages. Recent research, however, shows pretty conclusively from certain indications in the Sanskrit language itself that the latter must at one time have possessed the same, or very nearly the same, three vowel-sounds, and that the differentiation of the original *a*-sound must, therefore, have taken place before the separation of the languages

The vowels *i* and *u*, though apparently simple sounds, are classed as diphthongs, being constructed from original *ai* and *au* respectively, and liable to be treated as such in the phonetic modifications they have to undergo before any vowel except *ā*

Consonants

As regards the consonants, two of the five series of mutes, the palatal and lingual series, are of secondary (the one of Indo-Iranian, the other of purely Indian) growth

The palatals are, as a rule, derived from original gutturals, the modification being generally due to the influence of a neighbouring palatal sound *y* or *ṣ*, *caranā* = *Lat. carina*—*Let. carina*, *yānu*, *knue*. The final aspirate *ś*, in words of Indo-Germanic origin, almost invariably goes back to original *sk*, *a.g.*, *chid-* (*chanti*) = *scendo*, *ex* (*ka*, *chidyā*) = *scid*

The palatal sibilant *ś* (pronounced *sh*) likewise originated from a guttural mute *k*, but one of somewhat different phonetic value from that represented by Sanskrit *k* or *c*. The letter, usually designated by *ṣ* (or *g*), is frequently liable to palatalization (or dentalization) in Greek, probably owing to an original pronunciation *kw* (*m*) *a.g.*, *kātara* = *τρίτοπος*, *uter*, while the former (*k*) shows invariably *c* in Greek, and a sibilant in the Letto-Slavic and the Indo-Iranian languages. *a.g.*, *śam* (*fun*) = *κῶρυ* (*kur*), *carus*, *Gom* *huvā*, *dakṣ* = *δέκας*, *decem*, *Goth* *taihu*

The non-original nature of the palatals betrays itself even in Sanskrit by their inability to occur at the end of a word,—*a.g.*, *acc* *adām* = *Lat. agnam*, *nom* *adik* = *acc. adik*,—and by their being frequently reverting to the guttural state

The linguals differ in pronunciation from the dentals in their being uttered with the tip of the tongue turned up to the dome of the palate, while in the utterance of the dentals it is pressed against the upper teeth, not against the upper gums as is done in the English dentals, which to Hindus sound more like their own linguals. The latter, when occurring in words of Aryan origin, are, as a rule, modifications of original dentals, usually accompanied by the loss of *s* or other adjoining consonant, but more commonly they occur in words of foreign, probably non-Aryan, origin. Of regular occurrence in the language, however, is the change of dental *n* into lingual *ṇ*, and of dental *ṣ* into lingual *ṣ*, when preceded in the same word by certain other letters

The soant aspirate *h* is likewise non-original, being usually derived from original soant aspirated mutes, especially *gh*, *a.g.*, *haras* = *ṛis* (for *ṛas*), *masar*, *Gom* *gana*, *aham* = *tyār*, *eye*, *Goth* *sk*

Phonetic changes

The contact of final and initial letters of words in the same sentence is often attended in Sanskrit with considerable euphonic modifications; and we have no means of knowing how far the practice of the vernacular language may have corresponded to these phonetic theories. There can be no doubt, however, that a good deal in this respect has to be placed to the account of grammatical reflexion, and the very facilities which the transitive structure of the language offered for grammatical analysis and an insight into the principles of internal modification may have given the first impulse to external modifications of a similar kind

None of the cognate languages exhibits in so transparent a

manner as the Sanskrit the cardinal principle of Indo-Germanic word-formation by the addition of inflexional endings—either case-endings or personal terminations (themselves probably original 100%)-to stems obtained, mainly by means of affixes, from monosyllabic roots, with or without internal modifications

There are in Sanskrit declension three numbers and seven cases, not counting the vocative, viz, nominative, accusative, instrumental, dative, ablative, genitive and locative. As a matter of fact, all these seven cases appear, however, only in the singular of *a*-stems and of the pronominal declension. Other noun-stems have only one case-form for the ablative and genitive singular. In the plural, the ablative everywhere shares its form with the dative (except in the personal pronoun, where it has the same ending as in the singular), whilst the dual shows only three different case-forms—one for the nominative and accusative, another for the instrumental, dative and ablative, and a third for the genitive and locative

The declension of *a*-stems, corresponding to the first and second Latin declensions, is of especial interest, not so much on account of its being predominant from the earliest time, and becoming more and more so with the development of the language, but because it presents the greatest number of alternative forms, which supply a kind of test for determining the age of literary productions, a test which indeed has already been applied to some extent by Professor Lanman, in his excellent *Statistical Account of Non-Inflection in the Veda*. These alternative case-forms are —

(1) *das* and *dis* for the nominative plural *mas* and fem *a.g.*, *adishas* and *adis* = *agnis* (*agnis*). The form in *dis* is usually used by Bopp as the sign of the plural as applied twice, and by Schleicher as the sign of the plural as added to the nominative singular,—occur to those in *dis* (*i*), the ordinary plural sign as added to the *a*-stem) in the Rigveda in the proportion of 1 to 2, and in the peculiar parts of the Atharvaveda in that of 1 to 25, whilst the ending *as* alone remains in the later language

(2) *ā* and *au* for the nominative and accusative plural of neuters *a.g.*, *gagā*, *gagāu* = *Grk. γῆς*. The proportion of the former ending to the latter in the Rik is 11 to 7, in the Atharvan 2 to 3, whilst the classical Sanskrit knows only the second form

(3) *ebis* and *dis* for the instrumental plural *mas* and neuter *a.g.*, *adabhis*, *adibis*. In the Rik the former forms are to the latter in the proportion of 5 to 6, in the Atharvan of 1 to 6, while in the later language only the contracted form is used. The same contraction is found in other languages, but it is doubtful whether it did originate independently in the latter

(4) *ā* and *au* for the nominative and accusative dual *mas*, *a.g.*, *vibhā*, *vibhāu* = *ἄνθρωποι*. In the Rik forms in *ā* outnumber those in *au* more than eight times, whilst in the Atharvan, on the contrary, those in *au* (the only ending used in the classical language) occur five times as often as those in *ā*

(5) *ā* and *ena* (*end*) for the instrumental singular *mas* and neut. *a.g.*, *adibis*, *adibis* = *end*. The ending *ena* is the one universally used in the later language. It is likewise the usual form in the Veda, but in a number of cases it shows a final long vowel which, though it may be entirely due to metrical requirements, is more probably a relic of the normal instrumental ending *ā*, preserved for prosodic reasons. For the simple ending *ā*, as compared with that in *ena*, Prof. Lanman makes out a proportion of about 1 to 9 in the Rigveda (altogether 114 cases), while in the peculiar parts of the Atharva it is only 11 cases

(6) *ām* and *āmām* for the genitive plural, *a.g.*, *adibām*, *adibāmām* = *ἡρώων*, *ἡρώων* (*ἡρώων*). The form with inserted nasal (doubtless for *anām*, as in Zend *apandām*), which is exclusively used in the later language, is also the prevailing one in the Rik. There are, however, a few genitives of *a*-stems in original *ām* (for *a-ām*), which also appear in Zend, Prof. Lanman enumerating a dozen instances, some of which are, however, doubtful, while others are merely conjectural

The Sanskrit verb system resembles that of the Greek in variety Verb and completeness. While the Greek excels in nicety and definite-ness of modal distinction, the Sanskrit surpasses it in primitiveness and transparency of formation. In this part of the grammatical system there is, however, an even greater difference than in the noun inflection between the Vedic and the classical Sanskrit

While the former shows, upon the whole, the full complement of modal forms exhibited by the Greek, the later language has practically discarded the subjunctive mood. The Indo-Aryans never succeeded in working out a clear formative distinction between the subjunctive and indicative moods, and their syntactic requirements becoming more and more limited, they at last contented themselves, for modal expression, with a present optative and imperative, in addition to the indicative tense-forms, and a little-used aorist optative with a special "precatory" or "benefactive" meaning attached to it

Another part of the verb in which the later language differs widely from Vedic usage is the infinitive. The language of the old hymns shows a considerable variety of case-forms of verbal abstract nouns with the function of infinitives, a certain number of which

PART II—SANSKRIT LITERATURE.

The history of Sanskrit literature labours under the same disadvantages as the political history of ancient India, from the total want of anything like a fixed chronology. As there are extremely few well-ascertained political facts until comparatively recent times, so in that whole vast range of literary development there is scarcely a work of importance the date of which scholars have succeeded in fixing with absolute certainty. The original composition of most Sanskrit works can indeed be confidently assigned to certain general periods of literature, but as to many of them, and these among the most important, scholars have but too much reason to doubt whether they have come down to us in their original shape, or whether they have not rather, in course of time, undergone alterations and additions so serious as to make it impossible to regard them as genuine witnesses of any one phase of the development of the Indian mind. Nor can we expect many important chronological data from the new materials which will doubtless yet be brought to light in India. Though by such discoveries a few isolated spots may indeed be lighted up here and there, the real task of clearing away the mist which at present obscures our view, if ever it can be cleared away, will have to be performed by patient research—by a more minute critical examination of the multitudinous writings which have been handed down from the remote past. In the following sketch it is intended to take a rapid view of the more important works and writers in the several departments of literature.

In accordance with the two great phases of linguistic development above referred to, the history of Sanskrit literature readily divides itself into two principal periods, the Vedic and the classical. It should, however, be noted that these periods partly overlap each other, and that some of the later Vedic works are included in that period on account of the subjects with which they deal, and for their archaic style, rather than for any just claim to a higher antiquity than may have to be assigned to the oldest works of the classical Sanskrit.

I THE VEDIC PERIOD¹

The term *veda*—i.e., “knowledge,” (sacred) “lore”—embraces a body of writings the origin of which is ascribed to divine revelation (*śruti*, literally “hearing”), and which forms the foundation of the Brāhmanical system of religious belief. This sacred canon is divided into three or (according to a later scheme) four coordinate collections, likewise called *Veda*—(1) the *Rig-veda*, or lore of praise (or hymns); (2) the *Sāma-veda*, or lore of tunes (or chants); (3) the *Yajur-veda*, or lore of prayer, and (4) the *Atharva-veda*, or lore of the Atharvans.

Samhitās.

Each of these four Vedas consists primarily of a collection (*saṁhitā*) of sacred, mostly poetical, texts of a devotional nature, called *mantra*. This entire body of texts (and particularly the first three collections) is also frequently referred to as the *trayi vidyā*, or threefold wisdom, of hymn (*rich*), tune or chant (*śāman*), and prayer (*yajus*),—the fourth Veda, if at all included, being in that case classed together with the Rik.

Classes of priests

The Brāhmanical religion finds its practical expression chiefly in sacrificial performances. The Vedic sacrifices requires for its proper performance the attendance of four officiating priests, each of whom is assisted by one or

more (usually three) subordinate priests, viz.:—(1) the *Hotar* (i.e., either “sacrificer,” or “invoker”), whose chief business is to invoke the gods, either in short prayers pronounced over the several oblations, or in liturgical recitations (*śastra*), made up of various hymns and detached verses, (2) the *Udgātār*, or chanter, who has to perform chants (*śotra*) in connexion with the hotar’s recitations, (3) the *Adhvaryū*, or offering priest *par excellence*, who performs all the material duties of the sacrifice, such as the kindling of the fires, the preparation of the sacrificial ground and the offerings, the making of oblations, &c., (4) the *Brahman*, or chief “priest,” who has to superintend the performance and to rectify any mistakes that may be committed. Now, the first three of these priests stand in special relation to three of the Vedic Samhitās in this way, that the Samhitās of the Sāmaveda and Yajurveda form special song and prayer books, arranged for the practical use of the udgātār and adhvaryū respectively, whilst the Rik-samhitā, though not arranged for any such practical purpose, contains the entire body of sacred lyrics whence the hotar draws the material for his recitations. The brahman, on the other hand, had no special text-book assigned to him, but was expected to be familiar with all the Samhitās as well as with the practical details of the sacrificial performance. In point of fact, however, the brahman, though their attendance at Vedic sacrifices was required, can scarcely be said to have formed a separate class of priests: their office was probably one which might be held by any priest of the three other classes who had acquired the necessary qualification by additional study of the other Samhitās and manuals of ritual. In later times, when the votaries of the fourth Veda pressed for recognition of their Samhitā as part of the sacred canon, the brahman priest was claimed by them as specially connected with the Atharva-veda. It is perhaps for this reason that the latter is also called the *Brahmaveda*,—though this designation may also be taken to mean the Veda of spells or secret doctrines (*brahman*). It sometimes happens that verses not found in our version of the Rik-samhitā, but in the Atharva-veda-samhitā, are used by the hotar; but such texts, if they did not actually form part of some other version of the Rik,—as Sāyana in the introduction to his commentary on the Rik-samhitā assures us that they did,—were probably inserted in the liturgy subsequent to the recognition of the fourth Veda.

The several Samhitās have attached to them certain Brāhmanical prose works, called *Brahmana*, which, though subordinate in authority to the Mantras or Samhitās, are like them held to be divinely revealed and to form part of the canon. The chief works of this class are of an exegetic nature,—their purport being to supply a dogmatic exposition of the sacrificial ceremonial in so far as the particular class of priests for whose enlightenment the Brāhmana is intended is concerned in it. Notwithstanding the uninteresting character of no small part of their contents, the Brāhmanas are of considerable importance, both as regards the history of Indian institutions and as “the oldest body of Indo-European prose, of a generally free, vigorous, simple form, affording valuable glimpses backward at the primitive condition of unfettered Indo-European talk” (Whitney).

More or less closely connected with the Brāhmanas (and *Āraṇyaka* in a few exceptional cases with Samhitās) are two classes of treatises, called *Āraṇyaka* and *Upaṇishad*. The *Āraṇyakas*, i.e., works “relating to the forest,” being intended to be read by those who have retired from the world and

¹ J. Muir’s *Original Sanskrit Texts*, 5 vols., 2d ed., forms the most complete general survey of the results of Vedic research.

² The combination *śā*, used (in conformity with the usual English practice) in this sketch of the literature, corresponds to the simple *c* in the scheme of the alphabet, p. 270.

lead the life of anchorites, do not greatly differ in character and style from the Brāhmanas, but like them are chiefly ritualistic, treating of special ceremonies not dealt with, or dealt with only imperfectly, in the latter works, to which they thus stand in the relation of supplements. The Upanishads, on the other hand, are of a purely speculative nature, and must be looked upon as the first attempts at a systematic treatment of metaphysical questions. The number of Upanishads hitherto known is very considerable (about 170), but, though they nearly all profess to belong to the Ātharvaveda, they have to be assigned to very different periods of Sanskrit literature,—some of them being evidently quite modern productions. The oldest treatises of this kind are doubtless those which form part of Vedic Samhitās, Brāhmanas, and Āraṇyakas, though not a few others which have no such special connexion have to be classed with the later products of the Vedic age.

Different recensions. As the sacred texts were not committed to writing till a much later period, but were handed down orally in the Brāhmanical schools, it was inevitable that local differences of reading should spring up, which in course of time gave rise to a number of independent versions, more or less differing from one another. Such different text-recensions, called *śikṣā* (i.e., branch), were at one time very numerous, but only a limited number of them have survived. As regards the Samhitās, the poetical form of the hymns, as well as the concise style of the sacrificial formulas, would render these texts less liable to change, and the discrepancies of different versions would chiefly consist in various readings of single words or in the different arrangement of the textual matter. The diffuse ritualistic discussions and loosely connected legendary illustrations of the Brāhmanas, on the other hand, offered scope for very considerable modifications in the traditional matter, either through the ordinary processes of oral transmission or through the special influence of individual teachers.

An original Brāhmaṇa, then, may be characterized as a series of theoretic discourses, composed by recognized authorities on ritualistic matters, such as might be delivered or referred to in connexion with practical instruction in the sacrificial art. The growing intricacy of the ceremonial, however, could not fail, in course of time, to create a demand for treatises of a more practical tendency, setting forth, in concise and methodical form, the duties of the several priests in the sacrificial performances. But, besides the purely ceremonial matter, the Brāhmanas also contained a considerable amount of matter bearing on the correct interpretation of the Vedic texts, and, indeed, the sacred obligation incumbent on the Brāhmanas of handing down correctly the letter and sense of those texts necessarily involved a good deal of serious grammatical and etymological study in the Brāhmanical schools. These literary pursuits could not but result in the accumulation of much learned material, which it would become more and more desirable to throw into a systematic form, serving at the same time as a guide for future research. These practical requirements were met by a class of treatises, grouped under six different heads or subjects, called *Vedāṅgas*, i.e., members, or limbs, of the (body of) the Veda. None of the works, however, which have come down to us under this designation can lay any just claim to being considered as the original treatises on their several subjects, but they evidently represent a more or less advanced stage of scientific development. Though a few of them are composed in metrical form—especially in the ordinary epic couplet, the *anuṣṭubh śloka*, consisting of two lines of sixteen syllables, or of two octosyllabic pādas, each—the majority of them belong

to a class of writings called *sūtra*, i.e., “string,” consisting of *Sūtras*, as they do of strings of rules in the shape of tersely expressed aphorisms, intended to be committed to memory. The Sūtras form a connecting link between the Vedic and the classical periods of literature. But, although these treatises, so far as they deal with Vedic subjects, are included by the native authorities among the Vedic writings, and in point of language may, generally speaking, be considered as the latest products of the Vedic age, they have no share in the sacred title of *śruti* or revelation. They are of human, not of divine, origin. And yet, as the production of men of the highest standing, and profoundly versed in Vedic lore, the Sūtras are naturally regarded as works of great authority, second only to that of the revealed scriptures themselves, and their relation to the latter is expressed in the generic title of *Smṛita*, or Tradition, usually applied to them.

The six branches of Vedic science, included under the term *Vedāṅga*, are as follows—

(1) *Śikṣā*, or Phonetics. The privileged position of Phonetics representing this subject is assigned to a small treatise ascribed to the great grammarian Pāṇini, viz., the *Pāṇinīyā śikṣā*, extant in two different (Rik and Yajus) recensions. But neither this treatise nor any other of the numerous *śikṣās* which have recently come to light can lay claim to any very high age. Scholars, however, usually include under this head certain works, called *Prātisākhya*, i.e., “belonging to a certain *śikṣā* or recension,” which deal minutely with the phonetic peculiarities of the several Samhitās, and are of great importance for the textual criticism of the Vedic Samhitās.

(2) *Chandas*, or Metre. Tradition makes the *Chhān-Metre* *daś-sūtra* of Pingala the starting-point of prosody. The Vedic metres, however, occupy but a small part of this treatise, and they are evidently dealt with in a more original manner in the Nidāna-sūtra of the Sāmaveda, and in a chapter of the Rik-prātisākhya. For profane prosody, on the other hand, Pingala's treatise is rather valuable, no less than 160 metres being described by him.

(3) *Yyālarāna*, or Grammar. Pāṇini's famous grammar *Gramma* is said to be the *Vedāṅga*, but it marks the culminating point of grammatical research rather than the beginning, and besides treats chiefly of the post-Vedic language.

(4) *Nvukta*, or Etymology. Yāska's *Nvukta* is the Ety.-traditional representative of this subject, and this important work certainly deals entirely with Vedic etymology or explanation. It consists, in the first place, of strings of words in three chapters:—(1) synonymous words, (2) such as are purely or chiefly Vedic; and (3) names of deities. These lists are followed by Yāska's commentary, interspersed with numerous illustrations. Yāska, again, quotes several predecessors in the same branch of science, and it is probable that the original works on this subject consisted merely of lists of words similar to those handed down by him.

(5) *Jyotiṣa*, or Astronomy. Although astronomical Astro-calculations are frequently referred to in older works in connexion with the performance of sacrifices, the metrical treatise which has come down to us in two different recensions under the title of *Jyotiṣa*, ascribed to one Lagadha, or Lagata, seems indeed to be the oldest existing systematic treatise on astronomical subjects. With the exception of some apparently spurious verses of one of the recensions, it betrays no sign of the Greek influence which shows itself in Hindu astronomical works from about the third century of our era, and its date may therefore be set down as probably not later than the early centuries after Christ.

(6) *Kalpa*, or Ceremonial. Tradition does not single out any special work as the *Vedāṅga* in this branch of Vedic science; but the sacrificial practice gave rise to a large number of systematic sūtra-manuals for the several

classes of priests. The most important of these works have come down to us, and they occupy by far the most prominent place among the literary productions of the *sūtra*-period. The *Kalpa-sūtras*, or rules of ceremonial, are of two kinds—(1) the *Śrauta-sūtras*, which are based on the *śruti*, and teach the performance of the great sacrifices, requiring three sacrificial fires, and (2) the *Smṛiti-sūtras*, or rules based on the *smṛiti* or tradition. The latter class again includes two kinds of treatises—(1) the *Gṛhya-sūtras*, or domestic rules, treating of ordinary family rites, such as marriage, birth, name-giving, &c., connected with simple offerings in the domestic fire, and (2) the *Sāmavedyādhikāra* (or *Dharma*)-*sūtras*, which treat of customs and temporal duties, and are supposed to have formed the chief sources of the later law-books. Besides, the *Śrauta-sūtras* of the *Yajurveda* have usually attached to them a set of so-called *Śulva-sūtras*, i.e., “rules of the cord,” which treat of the measurement by means of cords, and the construction, of different kinds of altars required for sacrifices. These treatises (the study of which has been successfully taken up by Prof. Thibaut of Benares) are of considerable interest as supplying important information regarding the earliest geometrical operations in India. Along with the *Sūtras* may be classed a large number of supplementary treatises, usually called *Parīśiṣṭi* (परिशिष्टम्), on various subjects connected with the sacred texts and Vedic religion generally.

After this brief characterization of the various branches of Vedic literature, we proceed to take a rapid survey of the several Vedic collections.

A *Rigveda* ¹—The *Rigveda-saṃhitā* has come down to us in the recension of the Śākala school. Mention is made of several other versions, and, regarding one of them, that of the Bṛhadakya, we have some further information, according to which it seems, however, to have differed but little from the Śākala text. The latter consists of 1028 hymns, including eleven so-called *Vājakhyāns*, which were probably introduced into the collection subsequently to its completion. The hymns are composed in a great variety of metres, and consist, on an average, of rather more than 10 verses each, or about 10,000 verses in all. This body of sacred lyrics has been subdivided by ancient authorities in a twofold way, viz. either from a purely artificial point of view, into eight *aśtaka*s of about equal length, or, on a more natural principle, based on the origin of the hymns, and invariably adopted by European scholars, into ten books, or *mandalas*, of unequal length. Tradition (not, however, always trustworthy in this respect) has handed down the names of the reputed authors, or rather inspirers (“seers” (*ṛṣi*)), of most hymns. These indications have enabled scholars to form some idea as to the probable way in which the *Rik-saṃhitā* originated, though much still remains to be cleared up by future research.

In the first place, *mandalas* i–vii are evidently arranged on a uniform plan. Each of them is ascribed to a different family of *ṛṣi*s, whereas they are usually called the six “family-books”—i, u, the *Gṛtsamada*s, ii, the *Viśvāmitra* or *Kuśika*s, iii, the *Vama-dasyav*, v, the *Atre*, vi, the *Bharadvāja*s, and vii, the *Vasishtha*. Further, each of these books begins with the hymns addressed to Agni, the god of fire, which are followed by those to Indra, the Jupiter *Plaviyus*, whereupon follow those addressed to minor deities—the *Viśve Devāṇi* (“all-gods”), the *Maruts* (storm-gods), &c. Again, the hymns addressed to each deity are arranged (as Prof. Delbrück has shown) in a descending order, according to the number of verses of which they consist.

The first *mandala*, the longest in the whole *Samhitā*, contains 191 hymns, ascribed, with the exception of a few isolated ones, to sixteen poets of different families. Here again the hymns of each author are arranged on precisely the same principle as the

“family-books.” The eighth and ninth books, on the other hand, have a special character of their own. To the *Samaveda-saṃhitā*, which, as we shall see, consists almost entirely of verses chosen from the *Rik* for chanting purposes, these two *mandalas* have contributed a much larger proportion of verses than any of the others. Now, the hymns of the eighth book are ascribed to a number of different *ṛṣi*s, mostly belonging to the *Kāva* family. The productions of each poet are usually, though not always, grouped together, but no other principle of arrangement has yet been discovered. The chief peculiarity of this *mandala*, however, consists in its metres. Many of the hymns are composed in the form of stanzas, called *pragāthā* (from *gā*, “to sing”), consisting of two verses in the *bhāṭṭi* and *sotshi* *śatshi* metres, whence this book is usually known under the designation of *Pragāthāh*. The other metres met with in this book are likewise such as were evidently considered peculiarly adapted for singing, viz. the *gāyatrī* (from *gā*, “to sing”) and other chiefly octosyllabic metres. It is not yet clear how to account for these peculiarities, but further research may perhaps show that either the *Kāvas* were a family of udgātars, or chanters, or that, before the establishment of a common system of worship for the Brāhmanical community, they were accustomed to carry on their liturgical service exclusively by means of chants, instead of using the ordinary form of mixed recitation and chant. One of the *ṛṣi*s of this family is called *Pragāthā Kāva*, possibly this surname “*pragāthā*” may be an old, or local, synonym of *udgātari*, or perhaps of the chief chanter, the so-called *Prastotari*, or precentor. The ninth *mandala*, on the other hand, consists entirely of hymns (114) addressed to *Soma*, the deified juice of the so-called “moon-plant” (*Sarcostemma viminalis*, or *Azalea indica*), and ascribed to poets of different families, such as *Samadhānt*, “purification,” because they were to be recited by the *hotar* while the juice expressed from the soma plants was clarifying. The first sixty of these hymns are arranged strictly according to their length, ranging from ten down to four verses, but as to the remaining hymns no such principle of arrangement is observable, except perhaps in smaller groups of hymns. One might, therefore, feel inclined to look upon that first section as the body of soma hymns set apart, at the time of the first recension of the *Samhitā*, for the special purpose of being used as *paṇamānyā*,—the remaining hymns having been added at subsequent redactions. It would not, however, by any means follow that all, or even any, of the latter hymns were actually later productions, as they might previously have formed part of the family collections, or might have been overlooked when the hymns were first collected. Other *mandalas* (x, xi, xii, and xiii) are addressed to *Soma*, the deified juice, addressed to *Soma*, consisting together of 68 verses, of which only a single one (x 25, 1) is found in the *Śāmaveda-saṃhitā*, as also some 28 isolated verses to *Soma*, and four hymns addressed to *Soma* in conjunction with some other deity, which are entirely unrepresented in that collection.

The tenth *mandala* contains the same number of hymns (161) as the first, which it nearly equals in actual length. The hymns are ascribed to many *ṛṣi*s, of various families, some of whom appear already in the preceding *mandalas*. The traditional record is, however, less to be depended upon as regards this book, many names of gods and fictitious personages appearing in the list of its *ṛṣi*s. In the latter half of the book the hymns are clearly arranged according to the number of verses, in descending order,—occasional exceptions to this rule being easily accounted for by the removal of a few additional verses. A similar arrangement occurs also to suggest itself in other portions of the book. This *mandala* stands somewhat apart from the preceding books, both its language and the general character of many of its hymns betraying a comparatively modern origin. In this respect it stands about on a level with the *Atharvaveda-saṃhitā*, with which it is otherwise closely connected. Of some 1350 *Rik*-verses found in the *Atharva*, namely 550, or rather more than 40 per cent., occur in the tenth *mandala*. In the latter we meet with the same tendencies as in the *Atharva* to metaphysical speculation and abstract conceptions of the deity on the one hand, and to superstitious practices on the other. But, although in its general appearance the tenth *mandala* is decidedly more modern than the other books, it contains not a few hymns which are little, if at all, inferior, both in respect of age and poetic quality, to the generality of Vedic hymns.

It has become the custom, after the *Rik*, to call the *Rik-saṃhitā* (as well as the *Atharva*) an historical collection, as compared with the *Samhitā* put together for purely liturgical purposes. And indeed, though the several family collections which make up the earlier *mandalas* may originally have served ritual ends, as the hymnals of certain clans or tribal confederations, as compared with the *Samhitā* itself, in its oldest form, may have been intended as common prayer-books, and so speak for the *ṛṣi*s of the Brāhmanical community, it is certain that in the stage in which it has been finally handed down it includes a certain portion of hymn material (and even some secular poetry) which could never have been used for purposes of religious service. It may, therefore, be assumed that the *Rik-saṃhitā* contains all of the nature of popu-

¹ The *Rigveda* has been edited, together with the commentary of Śāyana (of the 14th century), by Max Müller, 6 vols., London, 1849–74. The same scholar has published an edition of the hymns, both in the connected (*saṃhitā*) and the disjointed (*paṭha*) texts, 1878. An edition in Roman transliteration was published by Th. Aufrecht, Berlin, 1861–8 (2d ed. 1877). Part of an English translation (chiefly based on Śāyana's interpretation) was brought out by the late Prof. H. H. Wilson (vols. i–iii, 1850–1857) and continued by Prof. H. B. Cowell (vol. iv, 1866, bringing up the work to *mandala* viii, hymn 20). We have also the first volume of a translation, with a running commentary, by M. Müller, containing the hymns to the *Maruts* or storm-gods. Complete German translations have been published by H. Grassmann (1876–7) and A. Ludwig (1876).

lar lyrics that was accessible to the collectors, or seemed to them worthy of being preserved. The question as to the exact period when the hymns were collected cannot be answered with any approach to accuracy. For many reasons, however, which cannot be detailed here, scholars have come to fix on the year 1000 B.C. as an approximate date for the collection of the Vedic hymns. From that time every means that human ingenuity could suggest was adopted to secure the sacred texts against the risks connected with oral transmission. But, as there is abundant evidence to show that even then not only had the text of the hymns suffered corruption, but that language had become antiquated to a considerable extent, and was only partly understood, the period during which the great mass of the hymns were composed must have been considerably further back, and must probably have extended over the earlier half of the second millennium, or from about 2000 to 1500 B.C.

As regards the people which raised for itself this imposing monument, the hymns exhibit it as settled in the regions watered by the mighty Sindhu (Indus), with its eastern and western tributaries. The land of the five rivers forms the central home of the Vedic people; but, while its advanced guard has already debouched upon the plains of the upper Ganga and Yamuna, the tribes who, lying up the rear, are still found lingering far behind in the narrow gorges of the Kubbā (Kabul) and Gomati (Gomal). Scattered over this tract of land, in hamlets and villages, the Vedic Āryas are leading chiefly the life of herdsmen and husbandmen. The numerous clans and tribes, ruled over by chiefs and kings, have still constantly to vindicate their right to the land but lately wrung from an inferior race of darker hue, just as in these latter days their kinsmen in the Far West are still being driven from the fertile attacks of the dispossessed red-skin. Not unfrequently, too, the light-coloured Āryas rage internecine war with one another, as when the Bharatas, with allied tribes of the Panjab, goaded on by the royal sage Vśiṣṭama, invade the country of the Tritsu king Sudās, to be defeated in the "ten kings' battle," through the inspired power of the priestly sage Vasishṭha. The priestly office has already become one of high social importance by the side of the political rulers, and to a large extent hereditary profession, but it does not yet present the baneful features of an exclusive caste. The Āryan housewife shares with her husband the daily toil and joy, the privilege of worshipping the national gods, and even the triumphs of song-craft, some of the finest hymns being attributed to female seers.

The religious belief of the people consists in a system of natural symbolism, a working out of the elements of nature, regarded as beings endowed with reason and power superior to those of man. In giving utterance to this simple belief, the priestly spokesmen has, however, frequently worked into it his own speculative and mystic notions. India, the stout-hearted ruler of the cloud-region, receives by far the largest share of the devout attentions of the Vedic seer. His ever-renewed battle with the malicious demons of darkness and drought, the recovery of the heavenly light and the rain-spending cows of the sky, forms an inexhaustible theme of spirited song. Next to him, in the affections of the people, stands Agni (gnus), the god of fire, invoked as the general inmate of the Āryan household, and as the bearer of oblations, and mediator between gods and men. Indra and Agni are thus, as it were, the divine representatives of the king (or chief) and the priest of the Āryan community, and it, in the arrangement of the Samhitā, the Brāhmana collections, and the Śākhya, the Agni, was the one of many avowals of their own hierarchical pretensions. Hence also the hymns to Indra are mostly followed, in the family collections, by those addressed to the Vśiṣṭa Devā (the "all-gods") or to the Maruṭa (Mavors, Maia), the warlike storm-gods and faithful companions of Indra, as the divine impersonation of the Āryan freemen, the *śūra* or clan. But, while Indra and Agni are undoubtedly the favourite figures of the Vedic pantheon, there is reason to believe that these gods, like the complicated and sinister group of deities who play a less prominent part in the hymns, viz., Father Heaven (Dyaus Pitar, *Zeus pater*, Jupiter), Varuna (*Apollon*), the all-embracing firmament, Mitra (Zand *Mithra*), the genial light of day, and Savitar (Saturnus) or Sūrya (*Solus*), the vivifying sun.

Of the Brāhmanas that were handed down in the schools of the Brāhmanas of *Bahurichas* (i.e., "possessed of many verses"), as the followers of the Rgyveda are called, two have come down to us, viz., those of the Āitareya and the Kaushitaka. The *Āṭva-gṛha-śāstra* and the *Kaushitaka-śāstra* (or *Sāṅkhya-śāstra*) Brāhmana evidently have for their groundwork the same stock of traditional exegetic matter. They differ, however, considerably as regards both the arrangement of this matter and their stylistic handling of it, with the exception of the numerous legends common to both, in which the discrepancy is comparatively slight. There is also a certain amount of material peculiar to each of them. The *Āṭva-śāstra*, as upon the whole, far more concise in its style and more systematic in its arrangement—means which would lead one to infer that it

is probably the more modern work of the two. It consists of thirty chapters (*adhyaṃya*), while the Āitareya has forty, divided into eight books (or pentads, *panchadh*, of five chapters each). The last ten *adhyaṃyas* of the latter work are, however, clearly a later addition, although they must have already formed part of it at the time of Pāṇini (c. 400 B.C.), if, as seems probable, one of his grammatical scribes, regulating the formation of the names of Brāhmanas, consisting of thirty and forty *adhyaṃyas*, refers to these two works. In this last portion occurs the well-known legend (also found in the *Sāṅkhya-śāstra*, but not in the *Kaushitaka-śāstra*) of Sunāsheta, whom his father Ajigarta sells and offers to sell, the recital of which formed part of the inauguration of kings. While the Āitareya deals almost exclusively with the Soma sacrifice, the *Kaushitaka*, in its first six chapters, gives of the several kinds of *havyajanya*, or offerings of rice, milk, ghee, &c., whereupon follows the Soma sacrifice in this way, that chapters 7-10 contain the practical ceremonial and 11-30 the recitations (*śāstra*) of the hotar *Sāyana*, in the introduction to his commentary on the work, ascribes the Āitareya to the sage Mahāśāstra Āitareya (son of Itarā), also mentioned elsewhere as a philosopher, and it seems likely enough that this person arranged the *Āṭva-śāstra* and founded the school of the Āitareya. Regarding the authorship of the sister work we have no information, except that the opinion of the sage Kaushitaka is frequently referred to in it as authoritative, and generally in opposition to the Paṅgave—the Brāhmana, it would seem, of a rival school, the Paṅgava.

Each of these two Brāhmanas is supplemented by a "forest-portion," or *Āraṇyaka*. The *Āṭva-āranyaka* is not a uniform production. It consists of five books, the first three, two of which of the first and the last two, are of a liturgical nature, treating of the ceremony called *madhva* or *gaut* *viv*. The second and third books, on the other hand, are purely speculative, and are also styled the *Bahurichas-brāhmana-upaniṣad*. Again, the last four chapters of the second book are usually singled out as the *Āṭva-upaniṣad*,¹ ascribed, like its Brāhmana (and the first book), to Mahāśāstra Āitareya, and the third book is also referred to as the *Sāṅkhya-upaniṣad*. The fourth and fifth books are doubtless of later origin, being composed in *śāstra*-form. Even native authorities exclude them from the sacred canon, and ascribe them to Āśva-lāyana and Saunaka respectively, of whom more further on. As regards the *Kaushitaka-āranyaka*, our MS. material is not yet sufficient to enable us to determine its exact extent and arrangement. It would, however, seem that there are two different recensions of this treatise, the shorter of which contains not longer one of fifteen, *adhyaṃyas*. Four of these, variously placed at the beginning or end, or after the second *adhyaṃya*, constitute the highly interesting *Kaushitaka- (brāhmana-) upaniṣad*,² of which we possess two different recensions. The remaining portions of the *Āraṇyaka* seem to correspond, to some extent, to the ceremonial sections of the Āitareya-*āranyaka*.

Of *Kāṇva-śāstra*, or manuals of sacrificial ceremonial, composed Śāhas of the use of the hotar priest, two different sets are in existence, Rgyveda.

The *Āṭva-śāstra* and the *Sāṅkhya-śāstra*. Each of these works follows one of the two Brāhmanas of the Rik as its chief authority, viz., the Āitareya and Kaushitaka respectively. Both consist of a *Srauta-* and a *Gṛhya-śāstra*. *Āśva-lāyana* seems to have lived about the same time as Pāṇini, his own teacher, Saunaka, who completed the *Rik-nirukṭhi*, being probably intermediate between the great grammarians Yāska, the author of the *Nirukṭi*. Saunaka himself is said to have been the author of the *Āṭva-śāstra* (which was, however, more of the nature of a Brāhmana) and to have destroyed it on seeing his pupil's work. A *Gṛhya-śāstra* is still quoted under his name by later writers. The *Āśva-lāyana Srauta-śāstra* consists of twelve, the *Gṛhya* of four, *adhyaṃyas*.

Regarding *Sāṅkhya-śāstra* still less is known, but he, too, was doubtless a comparatively modern writer, who, like *Āśva-lāyana*, founded a new school of ritualists. Hence the *Kaushitaka-brāhmana*, adopted (and perhaps improved) by him, also goes under his name, just as the Āitareya is sometimes called *Āśva-lāyana-brāhmana*. The *Sāṅkhya-śāstra* Srauta-śāstra consists of eighteen *adhyaṃyas*. The last two chapters of the work are, however, a later addition,³ while the two preceding chapters, on the contrary, present a comparatively archaic, Brāhmana-like appearance. The *Gṛhya-śāstra* consists of six chapters, the last two of which are likewise later appendages. The *Sāṅkhya-gṛhya-śāstra*, of which a single MS.

¹ Edited, with Śāyana's commentary, by Rājendralāla Mitra, in the *Pratishākhya Indica*, 1875-76. The first three books have been translated by F. Max Müller in *Sacred Books of the East*, vol. 1.

² Edited and translated by Dr. Roer, in the *Ind Ind*. The last chapter of the second book, not being commented upon by Śāyana, is probably a later addition. See, commentary, and a translation published by B. Cowell, in the *Ind Ind*.

³ Also a translation by F. Max Müller in *Sacred Books of the East*, a 21. Its text, as both works have been published with the commentary of Dargya Nārāyaṇa, by native scholars, in the *Ind Ind*. Also the text of the *Gṛhya*, with a German translation by A. Bendler.

⁴ See A. Weber's *aranyaka*, *Ind Studien*, II, p. 288 ff. This work, with its commentaries, is only accessible in manuscript.

⁵ Edited, with a German translation, by Hermann Oldenberg (*Ind. Stud.*, vol. 27), who also gives an account of the Sāmāyika *Gṛhya*.

¹ Edited, with an English translation, by M. Harg, 2 vols., Bombay, 1883. An edition in Roman transliteration, with extracts from the commentary, has been published by Th. Aufrecht, Bonn, 1879.

is at present known, seems to be closely connected with the preceding work. Prof. Bühler also refers to the *Rigveda* the *Vāsishta-dharmasūtra*,¹ composed of mixed sūtras and complets.

A few works remain to be noticed, bearing chiefly on the textual form and traditional recollections of the Rik-samhitā. In our remarks on the Vedāngas, the Prātiśākhya have already been referred to as the chief repositories of śākalā or Vedic phonetics. Among these works the *Rik-piṭhāśākhya*² occupies the first place. The original composition of this important work is ascribed to the same Śākalya from whom the vulgate recension of the (Śākala) Samhitā takes its name. He is also said to be the author of the existing *Pada-piṭha* (i.e., the text-form in which each word is given unconnected with those that precede and follow it)—a book which has not yet been identified, since the pada-text was doubtless prepared with a view to an examination, such as is presented in the Prātiśākhya, of the phonetic modifications undergone by words in their syntactic combination. In the Prātiśākhya itself, Śākalya's father (or Śākalya the elder) is also several times referred to as an authority on phonetics, though the younger Śākalya is evidently regarded as having improved on his father's theories. Thus both father and son probably had a share in the formulation of the rules of pronunciation and modification of Vedic sounds. The completion or final arrangement of the Rik-prātiśākhya, in its present form, is ascribed to Saunaka, the reputed teacher of Āśvalāyana. Saunaka, however, is merely a family name ("descendant of Saunaka"), which is given even to the rishi Gṛtsamadā, to whom nearly the whole of the second māṇḍala of the Rik is attributed. How long after Śākalya this name of the woman followed it, is not clear, but different suggestions at all events would seem to lie between them, considering that in the meantime the Śākalas, owing doubtless to minor differences on phonetic points in the Samhitā text, had split into several branches, to one of which, the Śaśira (or Śaśūya) school, Saunaka belonged. While Śākalya is referred to both by Yaska and Pāṇini, neither of these writers mentions Saunaka. It seems nevertheless likely, for several reasons, that Pāṇini was acquainted with Saunaka's work, though the point has by no means been definitely settled. The Rik-prātiśākhya is composed in mixed ślokas, or complets of various metres, a form of composition for which Saunaka seems to have had a special predilection. Besides the Prātiśākhya, and the Gṛhya-sūtra mentioned above, eight other works are ascribed to Saunaka, viz., the *Bṛhad-dēvatā*, an account, in epic ślokas, of the deities of the hymns, which supplies much valuable mythological information, the *Rig-vaṇśā*, a treatise on the Vedic hymns, and the *Pada-vaṇśā*, a similar treatise, apparently no longer in existence, and five different indexes or catalogues (*anuvākaṃ*) of the rishis, metres, deities, sections (*anuvāka*), and hymns of the Rigveda. It is, however, doubtful whether the existing version of the Bṛhad-dēvatā is the original one; and the Rigvidhāna would seem to be much more modern than Saunaka's time. As regards the Anuvākaṃs, they seem all to have been composed in mixed ślokas; but, with the exception of the Anuvākaṃs, they are only known from quotations, having been superseded by the *Sarvānukrama*, or complete index, of *Kāṭyāyana*. Both these indexes have been commented upon by Bhadrakūṣṭha, towards the end of the 12th century of our era.

B. Sāma-veda.—The term *sāman*, of uncertain derivation, denotes a solemn tune or melody to be sung or chanted to a *rich* or verse. The set chants (stotras) of the Sāmaveda are in rule performed in triplets, either actually consisting of three different verses, or of two verses which, by the repetition of certain parts, are made, as it were, to form three. The three verses are usually sung to the same tune, but in certain cases two verses sung to the same tune had a different sāman enclosed between them. One and the same sāman or tune may thus be sung to many different verses; but, as in teaching and practising the tunes the same verse was invariably used for a certain tune, the term "sāman," as well as the special technical names of sāmāns, are not unfrequently applied to the verses themselves with which they were most commonly connected, just as one would quote the beginning of the text of an English hymn, when the tune usually sung to that hymn is meant. The Indian chant somewhat resembles the Gregorian or Plain Chant.³ Each sāman is divided into five parts or phrases (*prastāva* or *pralāda*, &c.), the first four of which are distributed between the several chanters, while the finale (*anvāṇa*) is sung in unison by all of them.

In accordance with the distinction between *rich* or text and *sāman* or tune, the sāman-hymnal consists of two parts, viz., the *Sāmaveda-samhitā*, or collection of texts (*rich*) used for making up sāman-hymns, and the *Gāna*, or tune-books, song-books. The textual matter of the Samhitā consists of somewhat under 1600 different verses, selected from the Rik-samhitā, with the exception

of some seventy-five verses, some of which have been taken from Khila hymns, whilst others which also occur in the Atharvan or Yajurveda, as well as such not otherwise found, may perhaps have formed part of some other recension of the Rik. The *Sāmaveda-samhitā*⁴ is divided into two chief parts, the *pāṇva* (first) and the *utāva* (second) *gāthas*. The second part contains the texts of the sāman-hymns, arranged in the order in which they are actually required for the stotras or chants of the various Sama sacrifices. The first part, on the other hand, contains the body of tune-verses, or verses used for practising the several sāmāns or tunes upon, the tunes themselves being given in the *Gṛhita-gāya-gāna* (i.e., songs to be sung in the village), the tune-book specially belonging to the Prātiśākhya. Hence the latter includes all the first verses of those triplets of the second part which had special tunes peculiar to them, besides the texts of detached sāmāns occasionally used outside the regular ceremonial, as well as such as were perhaps no longer required but had been so used at one time or other. The verses of the Pūrvāchika are arranged on much the same plan as the family-books of the Rik samhitā, viz., in three sections containing the verses addressed to Agni, Indra, and Soma (*parāṇva* respectively)—each section (consisting of one, three, and six *adhyāyas* respectively) being again arranged according to the metres. Hence this part is also called *Chandas* (metre) *chārika*. Over and above this natural arrangement of the two āchikas, there is a purely formal division of the texts into six and nine *pāpāthikas* respectively, each of which, in the first part, consists of ten decades (daśatī) of verses. We have two recensions of the *śaśira*, belonging to the Rindāyāya and Rindāyāya schools, and differ but slightly from each other. Besides the six *pāpāthikas* (or five *adhyāyas*) of the Pūrvāchika, some schools have an additional "forest" chapter, called the *Avanyā-gāna-samhitā*, the tunes of which—along with others apparently intended for being chanted by anchorites—are contained in the *Avanyā-gāna*. Besides the two tune-books belonging to the Pūrvāchika, there are two others, the *Uga-gāna* ("modification-songs") and *Uga-gāna*, which follow the order of the Uttarāchika, and contain several old hymns chanted at the Sama sacrifice, with the modifications the tunes undergo when applied to texts other than those for which they were originally composed. The Sāman hymnal, as it has come down to us, has evidently passed through a long course of development. The practice of chanting probably goes back to very early times, but the question whether any of the tunes, as given in the Gānas, and which of them, can lay claim to an exceptionally high antiquity, we perhaps never receive a satisfactory answer.

The title of *Brahmana* is bestowed by the Chāṇḍogya, or Sāmān, followers of the Sāmaveda, on a considerable number of treatises relevant. In accordance with the statements of some later writers, their brāh-number was usually fixed at eight, but within the last few years maps, one new Brahmana has been recovered, while at least two others which are found quoted may yet be brought to light in India. The antiquity of the Sāmān Brahmanas is, however, none of the characteristic features of other works of that class, but they are rather of the nature of sūtras and kindred treatises, with which they probably belong to the same period of literature. Moreover, the contents of these works—as might indeed be expected from the nature of the duties of the priests for whom they were intended—are of an extremely arid and technical character, though they all are doubtless of some importance, either for the textual criticism of the Samhitā, or for the elucidation of the legendary and other information they supply. These works are as follows:—(1) the *Tāndya-mahā* (or *Pavāṇa*) *brāhmaṇa*, or "great" Brahmana, usually called *Panchavāṇa-brāhmaṇa* from its "consisting of twenty-five" *adhyāyas*—which treats of the duties of the udgātars generally, and especially of the various kinds of chants, (2) the *Shāṇḍavīya*, or "twenty-sixth," being a supplement to the preceding work,—its last chapter, which also bears the title of *Adikāṇḍa-brāhmaṇa*,⁵ or "book of music," is rather interesting, as it treats of all manner of portents and evil influences, which it teaches how to avert by certain rites and charms, (3) the *Sāmavā-dhāna*,⁶ analogous to the Rigvidhāna, descending on the magic effects of the various sāmāns, (4) the *Ārśheya-brāhmaṇa*, a mere catalogue of the technical names of the sāmāns in the order of the Pūrvāchika, known in two different recensions, (5) the *Dēvatā-dhāna*, which treats of the deities of the sāmāns, (6) the *Chāṇḍogya-brāhmaṇa*, the last eight *adhyāyas* (8-10) of which constitute the important Chāṇḍogyaopaniṣad,⁷ (7) the *Samatopaniṣad-brāhmaṇa*, treating of various subjects connected with chants, (8)

¹ Edited and translated by J. Sten Jones, 1849, a critical edition, with German translation and glossary, was published by Dr. Benfey, 1848, also an edition, with the Gānas and Sāmāns' commentary, by Śaṭyavāsa Sāmānram, in the *Indi Ind*, in 5 vols.

the *Yama-brahmana*, a mere list of the Sāmaveda teachers. To these works has to be added the *Jamāyaga*- or *Talaśādhara-brahmana*, discovered by the late Dr. A. Buehler, but as yet only known by a few extracts. From Prof. Whitney's account of it, the work stands much on a level with the Brāhmanas of the Rik and Yajurveda. A portion of it is the well-known *Kṛat*- or *Talaśādhara*-*upaniṣad*, on the nature of Brahman, as the supreme of deities.

Sāma-
veda-
śāstra

If the Sāmaveda has thus its ample share of Brāhmana-literature, though in part of a somewhat questionable character, it is not less richly supplied with śāstra-texts, some of which probably belong to the oldest works of that class. There are three Śrauta-śāstras, which attach themselves more or less closely to the Panchakṛti-brāhmana, the *śāśaka's Aśvaka-śāstra*, which gives the beginnings of the sāman in their sacrificial order, thus supplementing the *śiṣya-brāhmana*, which enumerates their technical names, and the Śrauta-śāstras of *Lāṭyāyana*² and *Drahyāyana*, of the Kāṇṭhika and Rāṇyāyana schools respectively, which differ but little from each other, and form complete manuals of the duties of the upādhyāy. Another śāstra, of an evagetic character, the *śaṅkhādi-śāstra*, likewise follows the Panchakṛti, the difficult passages of which it explains. Besides these, there are a considerable number of śāstras and kindred technical treatises bearing on the prosody and phonetics of the sāma-texts. The more important of them are—the *Rāṇḍana*, apparently intended to serve as a Pāṇinīyāyana of the Sāmaveda, the *Nidāna-śāstra*,³ a treatise on prosody, the *Puṣpa*- or *Phulla-śāstra*, ascribed either to Gobhila or to Yāyāuchi, and treatises of the phonetic modifications of the rich in the sāman, and the *Śāṇḍakā*, a treatise on chants, of a very technical nature. Further, two *Grhya-śāstras* belonging to the Sāmaveda, are hitherto known, viz. the *Drahyāyana-grhya*, ascribed to Khāṇḍa, and that of Gobhila⁴ (who is also said to have composed a śrauta-śāstra), with a supplement, entitled *Kaṇva-nidāna*, by Kāṭyāyana. To the Sāmaveda seems further to belong the *śāṇḍakā-dīpa-nakṣatra*,⁵ composed in śāstras, and apparently the oldest existing compendium of Hindu law.

Samhitā
of Black
Yajur-
veda.

The *Yajur-śāstra*—This sacrificial Veda of the Adhvaryu priests, divides itself into an older and a younger branch, or, as they are usually called, the Black (*Kṛishna*) and the White (*śukla*) Yajurveda. Tradition ascribes the foundation of the Yajurveda to the sage Yatsampayana. Of his disciples three are specially named, viz., Kātha, Kāṭpina, and Yaska Paingī, the last of whom again is stated to have communicated the sacrificial science to Tritam. How far this genealogy is correct, we are not able to determine, but certain it is that in accordance therewith we have three old collections of Yajur-texts, viz. the *Kāthaka*, the *Kāṭpina*, or *Maitreyani Samhitā*,⁶ and the *Taittiriya-samhitā*.⁷ The Kāthaka and Kāṭpina are frequently mentioned together, and the author of the "great commentary" on Pāṇini once remarks that these works were taught in every village. The Kāthaka and Kāṭpina are often referred to under the collective name of Chāraka, which apparently means "wayfarers" or itinerant scholars, but according to a later writer (Hemachandra) Chāraka is no other than Yatsampayana himself, after whom his followers would have been thus called. From the Kāthas proper two schools seem early to have branched off, the *Pichāya* (eastern) and *Kapishthala*. Kāthes, the text-recension of the latter of whom has recently been discovered in the *Kapishthala-katha-samhitā*. The Kāṭpina also soon became source of two more distinct schools. Thus from out of Kāṭpina's immediate disciples, Haridra, the Hāndravyas took their origin, whose text-recension, the *Hāndravyas*, is quoted together with the Kāthaka as early as in Yaska's *Nirukta*, but we do not know whether it differed much from the original Kāṭpina texts. As regards the Taittiriya-samhitā, that collection, too, in course of time gave rise to a number of different schools, the text handed down being that of the Apastambas, while the contents of another recension, that of the Āṭvayas, are known from their *Anukramik*, which has been preserved.

The four collections of old Yajur texts, so far known to us, while differing more or less considerably in arrangement and verbal points, have the main mass of their textual matter in common. This common matter consists of both sacrificial prayers (yajus) in verse and prose and exegetic or illustrative prose portions (brāhmana). A prominent feature of the old Yajur texts, as compared with the other Vedas, is the constant intermixture of textual and exegetic portions. The Chārakas and Taittiriya texts do not recognize the distinction between Samhitā and Brāhmana in the sense of two separate collections of texts, but they have only a Samhitā, or collection, which includes likewise the exegetic or

Brāhmana portions. The Taittiriya seems at last to have been impressed with their want of a separate Brāhmana and to have set about supplying the deficiency in rather an awkward fashion instead of separating from each other the textual and exegetic portions of their Samhitā, they merely added to the latter a supplement (in three books), which shows the same mixed condition, and applied to it the title of *Taittiriya-brāhmana*.⁸ But, though the main body of this work is manifestly of a supplementary nature, a portion of it may perhaps be old, and may once have formed part of the Samhitā, considering that the latter consists of seven aśtakas, instead of eight, as this text requires, and that certain essential parts of the ceremonial handled in the Brāhmana are entirely wanting in the Samhitā. Attached to this work is the *Taittiriya-dharmasūtra*,⁹ in ten books, the first six of which are of a ritualistic nature, while of the remaining books the first three (7-9) form the *Taittiriya-sūtramahad* (consisting of three parts, viz. the Śiṣhāvallī or Samhitopaniṣad, and the Anandavallī and Bhṛiguavallī, also called together the Varuṇopaniṣad), and the last book forms the Nāḍāyana- (or Yājñikī) upaniṣad.

The *Maitreyani Samhitā*, the identity of which with the original Kāṭpina has been proved pretty conclusively by Dr. V. Schröder, who attributes the change of name of the Kāṭpina-Maitreyaniya to Buddhist influences, consists of four books, attached to which is the *Maitri*- (or *Maitrayani*) upaniṣad.¹⁰ The *Kāthaka*, on the other hand, consists of five parts, the last two of which, however, are perhaps later additions, containing mainly the prayers of the hota priest, and those used at the house-sacrifice. There is, moreover, the beautiful *Kāṭhaka* or *śāṇḍakā*, which is also ascribed to the Āṭvavallī, and in which Dr. Roer would detect allusions to the Sāṅkya philosophy, and even to Buddhist doctrines.

The defective arrangement of the Yajur texts was at last Samhitā remedied by a different school of Adhvaryus, the Yajñasanyus of White. The reputed originator of this school and its text-recension is Yajñasanyus (son of Yajñasanyus). The result of the re-arrangement of the texts was a collection of sacrificial mantras, the *Yajñasanyus-samhitā*, and a Brāhmana, the *Satapatha*. On account of the greater lucidity of this arrangement, the Yajñasanyus called their texts the White (or clear) Yajurveda, the name of Black (or obscure) Yajus being for opposite reasons applied to the Chāraka texts. Both the Samhitā and Brāhmana of the Yajñasanyus have come down to us in two different recensions, viz., those of the Kāṭhaka and Kāṭpina schools, and we find ourselves considerable number of quotations from a Yajñasanyus, from which we cannot doubt that there must have been at least one recension of the Satapatha-brāhmana. The difference between the two extant recensions is, on the whole, but slight as regards the subject-matter, but in point of diction it is quite sufficient to make a comparison especially interesting from a philological point of view. Which of the two Yajñasanyus may be the more original cannot yet be determined, but the phonetic and grammatical differences will probably have to be accounted for by a geographical separation of the two schools rather than by a difference of age. In several points of difference the Kāṭpina recension agrees with the practices of the Rik-samhitā, and there probably was some connexion between the Yajur school of Kāṭpina and the famous family of names of that name to which the eighth māṇḍala of the Rik is attributed.

The *Yajñasanyus-samhitā*¹¹ consists of forty adhyāyas, the first eighteen of which contain the formulas of the ordinary sacrifices. The last fifteen adhyāyas are doubtless a later addition,—as may also be the case as regards the preceding seven chapters. The last adhyāya is commonly known under the title of *Yajñasanyus-samhitā* (or *śāṇḍakā*) upaniṣad.¹² Its object seems to be to point out the fruitlessness of mere works, and to insist on the necessity of man's acquiring a knowledge of the supreme spirit. The sacrificial texts of the Adhvaryus consist, in about equal parts, of high antiquity (old) and prose formulas (yajus). The majority of the former occur likewise in the Rik-samhitā, from which they were doubtless extracted. Not unfrequently, however, they show considerable discrepancies of reading, which may be explained partly from a difference of recension and partly as the result of the adaptation of these verses to their special sacrificial purpose. As regards the prose formulas, though only a few of them are actually referred to in the Rik, it is quite possible that many of them may be of high antiquity (old). The *Satapatha-brāhmana*,¹³ or *Bṛuhmana* of a hundred parts, Brāhmana is its name from the fact of its consisting of 100 lectures (mantras), which are divided by the Mādhyanvanta into fourteen, by of White Yajur-veda.

the Kāvas into seventeen books (kānda). The first nine books of the former, corresponding to the first eleven of the Kāvas, and consisting of sixty adhyāyas, form a kind of running commentary on the first eighteen books of the Vāṇ-Saṁhitā, and it has been plausibly suggested by Prof. Weber that this portion of the Bāhmana may be referred to in the *Āra* bhāṣya on *Āra* iv 3, 60, where a *Saṁhitā* and a *Shashti-pāṭha* (i.e., "consisting of 60 pāṭha") are mentioned together as objects of study, and that consequently it may at one time have formed an independent work. This view is also supported by the circumstance that of the remaining five books (10-14) of the Mādhyandina the third is called the middle one (*madhyama*), while the Kāvas apply the same epithet to the middlemost of the *Āra* books (12-16) preceding their last one. This last book would thus seem to be treated as them as a second supplement, and not without reason, as it is of the Upanishad order, and bears the special title of *Bṛhad-* (great) *adhyāya*.¹ Except in books 6-10 (*Āra*), which treat of the construction of fire-altars, and recognize the sage Sāndilya as their chief authority, Yāyavalkya's opinion is frequently referred to in the *Saṁhitā* as authoritative. This is especially the case in the later books, part of the *Bṛhad-*adhyāyas being even called Yāyavalkya-kānda. As *Āra* bhāṣya regards the age of the *Saṁhitā*, the probability is that the main body of the work is considerably older than the time of Pāṇini, but that some of its latter parts were considered by Pāṇini's critics Kātyāyana to be of about the same age as, or not much older than, Pāṇini. Even those portions had probably been long in existence before they obtained recognition as part of the canon of the White Yajus.

The contemptuous manner in which the doctrines of the Chāṇakya-adhyāyas are repeatedly annulled upon in the *Saṁhitā* betrays not a little of the *adum theologian* on the part of the divines of the Vāṇaneyas towards their brethren of the older schools. Not was their animosity confined to mere literary warfare, but they seem to have striven by every means to gain ascendancy over their rivals. The consolidation of the Bāhmanian hierarchy and the establishment of a common system of ritual worship, which called forth the liturgical Vedic collections, was also consummated in the so-called Mādhyādeśa, or "middle country," lying between the Sarasvatī and the confluence of the Yamunā and Gaṅgā, and more especially in its western part, the Kuru-kṣetra, or land of the Kurus, with the adjoining territory of the Pañchālas, between the Yamunā and Gaṅgā. From thence the original schools of Vedic ritualism gradually extended their sphere over the adjoining parts. The Chāṇakya for a long time to have held sway in the western and north-western regions, while the Taittirīyas in course of time spread over the whole of the peninsula south of the Narmadā (Nerbudda), where their ritual has remained pre-eminently the object of study till comparatively recent times. The Vāṇaneyas, on the other hand, having first gained a footing in the lands on the lower Gaṅges, chiefly it would seem, through the patronage of King Janaka of Videha, thence gradually worked their way westwards, and eventually succeeded in superseding the older schools north of the Yamunā, with the exception of some isolated places where even now families of Bāhmanas are met with which profess to follow the old Saṁhitā.

In *Kaiva-sūtras* the Black Yajurveda is particularly rich, but, owing to the circumstances just indicated, they are almost entirely confined to the Taittirīya schools. The only *Srauta-sūtra* of a Chāṇakya school which has hitherto been recovered is that of the Mānavas, a subdivision of the Maitrīyānyas. The *Mānavas-brāhma-sūtra** seems to consist of eleven books, the first nine of which treat of the sacerdotal ritual, while the tenth contains the *Sūtra-sūtra*, and the eleventh is made up of a number of supplements (*parvaṇṭha*). The *Mānavas-grhya-sūtra* is likewise in existence, but so far nothing is known, save one or two quotations, of a *Mānavas-dharma-sūtra*, which might be of some importance. Of *śrautas* concerning the development of Indian law. Of *śrautas* belonging to the Kāthas, a single treatise, the *Kāthaka-dharma-sūtra*, is known, while Dr. Jolly considers the *Vaishnavi-smṛiti*,³ a compendium of law, composed in mixed *sūtras* and *ślokas*, to be nothing but a Vaishnavite recast of the Kāthaka-dharma-sūtra, which seems no longer to exist. As regards the Taittirīyas, the *Kaiva-sūtra* must have been widely accepted among them as that of Apastamba, to whose school, as we have already seen, was also due our earliest recognition of the Taittirīya-saṁhitā. The *paṭasāna-kāiva-sūtra* consists of thirty *prāśna* (questions), the first twenty-five of these constitute the *Srauta-sūtra**, 26 and 27 the *Grhya-sūtra*, 28 and 29 the *Dharma-sūtra*, and the last the *Sūtra-sūtra*. Prof. Bühler has tried to fix the date of this work somewhere between the 5th and 8th

centuries B.C., but it can hardly yet be considered as definitely settled. Considerably more ancient than this work are the *Bṛhad-yajus-kāiva-sūtra*, which consists of the same principal divisions, and the *Bṛhad-yajus-sūtra*, of which, however, only a few portions have as yet been discovered. The *Īṣaṅgāśa-sūtra*, which is more modern than that of Apastamba, from which it differs but little, is likewise fragmentary, and several other *Kaiva-sūtras*, especially that of Langkeshi, are found quoted. The names of the authors of the White Yajus ritual is the *Srauta-sūtra* of Kātyāyana,⁴ in twenty-six adhyāyas. This work is supplemented by a large number of secondary treatises, likewise attributed to Kātyāyana, among which may be mentioned the *Chāṇakya-sūtra*, a statistical account of the Vedic schools, which unfortunately has come down to us in a very unsatisfactory state of preservation. A manual of domestic rites, closely connected with Kātyāyana's work, is the *Kātyāyana-grhya-sūtra*,⁵ ascribed to Pāṇini. To Kātyāyana we further owe the *Vāṇaneyas-pāṇinīyāyana*,⁶ and a catalogue (*anubhāṇṇa*) of the White Yajus texts. As regards the former work, it is still doubtful whether (with Weber) we have to consider it as older than Pāṇini, or whether (with Goldstucker and M. Müller) we are to identify its author with Pāṇini's critic. The only existing text of the Black Yajus belongs to the Taittirīyas. Its author is unknown, and it confines itself entirely to the *śrauta-saṁhitā*, to the exclusion of the Bāhmana and *Āraṇyaka*.

D. *Ātharva-veda*.—The *Ātharva* was the latest of Vedic collections to be recognized as part of the sacred canon. That it is really also the youngest Veda is proved by its language, which, both *saṁhitā* from a lexical and a grammatical point of view, marks an intermediate stage between the main body of the Rik and the Bāhmana period. It is not less manifest from the spirit of its contents, which shows that the childlike trust of the early singer in the willingness of the divine agents to comply with the earnest request of their pious worshippers had passed away, and in its place and sprung up a superstitious fear of a host of malevolent powers, whose baleful wrath had to be propitiated or turned aside by incantations and magic contrivances. How far some lower form of worship, suggested by the conquests of the Aryan, may have led to this change of religious belief it would be idle to inquire; but it is far from improbable that the hymns of the Rik reflect chiefly the religious notions of the more intelligent and educated minority of the community, and that superstitious practices like those disclosed by the greater part of the *Ātharva* and a portion of the tenth book of the Rik had long obtained among the people, and became the more prevalent the more they were fostered by the people gave themselves up to theosophical and metaphysical speculations. Hence also verses of the *Ātharva* were not infrequently used in domestic (*grhya*) rites, but very seldom in the *Srauta* ceremonial. But, even if these or such like spells and incantations had long been in popular use, there can be no doubt that by the time they were collected they must have adapted themselves to the conditions which the vernacular language itself had undergone in the mouths of the people.

This body of spells and hymns is traditionally connected with two old mythic priestly families, the Angiras and *Ātharvas*, thence names, in the plural, saving either singly or combined (*Ātharvāṅgirasas*) as the oldest appellation of the collection. Instead of the *Ātharvas*, another mythic family, the Bhṛigus, are similarly connected with the Angiras (*Bhṛigvāṅgirasas*) as the depositaries of this mystic science. The current text of the *Ātharva-saṁhitā*⁷—apparently the recension of the Śaṅkaka school—consists of some 750 different pieces, about five-sixths of which is in various metres, the remaining portion being in prose. The whole mass is divided into twenty books. The principle of distribution is for the most part a merely formal one, in books i.-xiii pieces of the same or about the same number of verses being placed together in the same book. The next five books, xiv.-xviii, have each its own special subject—xiv treats of marriages and sexual union, xv, in prose, of the *Vṛtya*, or religious vespertine, xvi consists of prose formulas of communion, xvi of a lengthy mystical hymn, and xviii contains all that relates to death and funeral rites. Of the last two books no account is taken in the *Ātharva-prāśnādhya*, and they indeed stand clearly in the relation of supplements to the original collection. The eighteenth book evidently was the result of a subsequent gathering of pieces similar

¹ The text, with Śaṅkara's commentary, and an English translation, published by E. Reer, *Bibl Ind*.

² See P. v. Bredius, *Z D M G*, vol. xxxvi. A MS of a portion of the *Srauta-sūtra*, with the commentary of the famous Mādhava Kumbhāra, has been photographed by the India Office, under Goldstucker's supervision.

⁵ G. Bühler has published the text with extracts from Haradatta's commentary, also a translation in *Sacred Books of the East*.

⁶ The *Sūtra-sūtra* has been published, with the commentary of Kapāḍinī, and a translation by G. Bühler, in the *Bibl Ind*, fasc. 187. The *Dharma-sūtra* has been translated by G. Bühler, *Sacred Books*, xiv.

⁷ Edited by A. Weber.

⁸ Text and German translation by A. Stenzler.

⁹ Edited, with Urvā's commentary, and a German translation, by A. Weber, *Bibl Ind*, xvi.

¹⁰ The work has been published by W. D. Whitney, with a translation and a commentary by an unknown author, called Tribhāṇyāna, &c., "jewel of the three commentaries," it being founded on three older commentaries by Yāyavalki, (Kāṇva), Mithīkya, and Atreya.

¹¹ Edited by Prof. Roth and Whitney, 1856. The second vol., which was to contain the *Verses Lectures*, remains still unpublished. Prof. Whitney, however, has lately brought out an Index Verborum to the work. The first three books have been translated into German by Prof. Weber, *Bibl Ind*, vols. iv, vi, xvii.

to those of the earlier books, which had probably escaped the collectors' attention, while the last book, consisting almost entirely of hymns to Indra, taken from the Rik-saṁhitā, is nothing more than a liturgical manual of the recitations and chants required at the Soma sacrifices.

The Atharva has come down to us in a much less satisfactory state of preservation than any of the other Saṁhitās, and its interpretation, which offers considerable difficulties on account of numerous popular and out-of-the-way expressions, has so far received comparatively little aid from native sources. A commentary by the famous Vedic exegete Śāyana, which has lately come to light in India, may, however, be expected to throw light on some obscure passages. Even more important is the discovery, some years ago, through the exertions of Sir William Muir, of an entirely different recension of the Atharva-saṁhitā, preserved in Kashmir. This new recension,¹ supposed to be that of the Paipalāda school, consists likewise of twenty books (kānda), but both in textual matter and in its arrangement it differs very much from the current text. A considerable portion of the latter, including unfortunately the whole of the eighteenth book, is wanting; while the hymns of the nineteenth book are for the most part found also in the text, though not as a separate book, but scattered over the whole collection. Possibly, therefore, this recension may have formed one of the sources whence the nineteenth book was compiled. The twentieth book is wanting, with the exception of a few of the verses not taken from the Rik. As a set-off to these shortcomings the new version offers, however, a good deal of fresh matter, amounting to about one-sixth of the whole. From the Manu-saṁhitā and other works quoted as the beginning of the Atharva-saṁhitā a verse, which coincides with the first verse of the sixth hymn of the current text, it has long been known that at least one other recension must have existed, but owing to the defective state of the Kashmir MS it cannot be determined whether the new recension (as seems likely) corresponds to the one referred to in those works.

Atharva-veda-śāh-māna
The only Brāhmana of the Atharva, the *Āpṇadī-brāhmana*,² is probably one of the most modern works of its class. It consists of two parts, the first of which contains cosmogonic speculations, interspersed with legends, apparently taken from other Brāhmanas, and general instructions on religious duties and observances, while the second part treats, in a very desultory manner, of various points of the sacrificial ceremonial.

Atharva-veda-sūtras
The Kalpa-sūtras pertaining to this Veda comprise both a manual of sacrificial rites, the *Pāṇḍura-dharma*,³ and a manual of domestic rites, the *Kaushika-sūtra*. The latter is not only the more interesting of the two, but also the more ancient, being actually quoted in the other. The teacher Kaushika is repeatedly referred to in the work on points of ceremonial doctrine. Connected with this Sūtra are upwards of seventy *Parishādas*, or supplementary treatises, mostly in metrical form, on various subjects bearing on the performance of gṛhya rites. The last sūtra-work to be noticed in connexion with this Veda is the *Saṁvatsāra Chakra-dhītyāyikā*,⁴ being a Prātishākhya of the Atharva-saṁhitā, so called from its consisting of four lectures (śabhyas). Although Śaṅkara can hardly be credited with being the actual author of the work, considering that his opinion is rejected in the only rule where his name appears, there is no reason to doubt that it chiefly embodies the phonetic theories of that teacher, which were afterwards perfected by members of his school. Whether this Saṁvatsāra is identical with the writer of the final redaction of the final redaction of the prātishākhya of the Rik is ascribed is not known, but it is worthy of note that on at least two points where Śākalya is quoted by Pāṇini, the Chaturdhītyāyikā seems to be referred to rather than the Rik-prātishākhya. Śaṅkara is quoted once in the Vāgasaneyi-prātishākhya, and it is possible that Kātyāyana had the Chaturdhītyāyikā in view, though his reference does not quite tally with the respective rule of that work.

Upanishads.
Another class of writings alluded to as traditionally connected with the Atharvaveda are the numerous *Upanishads*,⁵ which do not specially attach themselves to one or other of the Saṁhitās or Brāhmanas of the other Vedas. The Atharvāna-upanishads, mostly composed in stanzas, may be roughly divided into two classes, viz., those of a purely speculative or general pantheistic character, treating chiefly of the nature of the supreme spirit, and the means of attaining to union therewith, and those of a sectarian tendency. Of the former category, a limited number—such as the Prāśna, Māṇḍūkya, and Māṇḍūkya-upanishads—have

probably to be assigned to the later period of Vedic literature; whilst the others presuppose more or less distinctly the existence of some fully developed system of philosophy, especially the Vedānta or the Yoga. The sectarian Upanishads, on the other hand—identifying the supreme spirit either with one of the forms of Vishnu (such as the Nārāyaṇa, Nṛamaṇḍa-upanishad, Rāmā-tāpānya, Goḍā-tāpānya), or with Śiva (e.g. the Rudrāpanishad), or with some other deity—belong to post-Vedic times.

II THE CLASSICAL PERIOD.

The classical literature of India is almost entirely a product of artificial growth, in the sense that its vehicle was not the language of the general body of the people, but of a small and educated class. It would scarcely be possible, even approximately, to fix the time when the literary idiom ceased to be understood by the common people. We only know that in the 3d century B.C. there existed several dialects in different parts of northern India, which differed considerably from the Sanskrit, and Buddhist tradition, moreover, tells us that Gaṇtama Śākyamuni himself, in the 6th century B.C., made use of the local dialect of Magadha (Behar) for preaching his new doctrine. Not unlikely, indeed, popular dialects, differing perhaps but slightly from one another, may have existed as early as the time of the Vedic hymns, when the Indo-Aryans, divided into clans and tribes, occupied the Land of the Seven Rivers, but such dialects must, at any rate, have sprung up after the extension of the Aryan sway and language over the whole breadth of northern India. Such, however, has been the case in the history of all nations; and there is no reason why, even with the existence of local dialects, the literary language should not have kept in touch with the people in India, as elsewhere, but for the fact that from a certain time that language remained altogether stationary, allowing the vernacular dialects more and more to diverge from it. Although linguistic research had been successfully carried on in India for centuries, the actual grammatical fixation of Sanskrit seems to have taken place about contemporaneously with the first spread of Buddhism, and indeed that popular religious movement undoubtedly exercised a powerful influence on the linguistic development of India.

A Poetical Literature

1 *Epic Poems*—The Hindus, like the Greeks, possess two The great national epics, the *Rāmāyana* and the *Mahābhārata*, national epics. The *Rāmāyana*, a poem "relating to Rāma," is ascribed to the poet Vālmīki, and allowance being made for later additions here and there, the poem indeed presents the appearance of being the work of an individual genius. In its present form it consists of some 24,000 stanzas, or 48,000 lines of sixteen syllables, divided into seven books.

(I.) King Daśaratha of Kośala, reigning at Ayodhyā (Oudh), has four sons born him by three wives, viz., Rāma, Bharata, and the twins Lakshmana and Saugandha. Rāma, by being able to bend an enormous bow, formerly the dreaded weapon of the god Rudra, wins for a wife Sītā, daughter of Janaka, king of Vidhā (Thibet). (II.) On his return to Ayodhyā he is to be appointed her apparent (yuvā-rāja, i.e., juvenis rex), but Bharata's mother persuades the king to banish his eldest son for fourteen years to the wilderness, and appoint her son instead. Separation from his favourite son soon breaks the king's heart, whereupon the ministers call on Bharata to assume the reins of government. He refuses, however, and betaking himself to Rāma's retreat on the Chitrakūṭa mountain (in Bundelkhund), implores him to return, but, unable to shake Rāma's resolve to complete his term of exile, he consents to take charge of the kingdom in the meantime. (III.) After a ten years' residence in the forest, Rāma attracts the attention of a female demon (Rākshas), and, infuriated by the rejection of her advances, and by the wounds inflicted on her by Lakshmana, who keeps Rāma company, she incites her brother Rāvana, denouncing Ceylon, with lots for Sītā, in consequence of which the latter is carried off by him to his capital Lankā. While she resolutely rejects the Rākshasa's addresses, Rāma sets out with his brother to her rescue. (IV.) After numerous adventures they

⁴ This difficult treatise is about to be published by Prof. Bloomfield. Two sections of it have been printed and translated by A. Weber "Omnia et Portenta," 1859.

⁵ Edited and translated by W. D. Whitney.

⁶ For a full list of existing translations of and essays on the Upanishads, see Intro. to Max Müller's Upanishads, Sacred Books, I.

enter into an alliance with Sugriva, king of the monkeys, and, with the assistance of the monkey-general Hanumān, and Rāvana's own brother Vibhishana, they prepare to assault Lankā (V) The monkeys, tearing up rocks and trees, construct a passage across the straits—the so-called Adam's Bridge, still designated Rāma's Bridge in India (VI) Having crossed over with his allies, Rāma, after many hot encounters and marvellous deeds, slays the demon and captures the stronghold, whereupon he places Vibhishana on the throne of Lankā To alay Rāma's misgivings as to any tant he might have incurred through contact with the demon, Sītā now undergoes an ordeal by fire, after which they return to Ayodhyā, where, after a tumultuous entry, Kīcaka is installed (VII) In the last book—probably a later addition—Rāma, who feels that the people are not yet satisfied of Sītā's purity, resolves to put her away, whereupon, in the forest, she falls in with Vālmīki himself, and at his hermitage gives birth to two sons While growing up there, they are taught by the sage the use of the bow, as well as the Vēdas, and the Rāmāyana as far as the capture of Lankā and the royal entry into Ayodhyā Ultimately Rāma discovers and recognizes them by their wonderful deeds and then likeness to himself, and takes his wife and sons back with him

The *Mahābhārata*,¹ i.e., "the great (poem or feud) of the Bhāratas," on the other hand, is not so much a uniform epic poem as a miscellaneous collection of epic poetry, consisting of a heterogeneous mass of legendary and didactic matter, worked into and round a central heroic narrative The authorship of this work is aptly attributed to Vyāsa, "the arranger," the personification of Indian diaskeuasis Only the bare outline of the leading story can here be given.

In the royal line of Hastināpura (the ancient Delhi)—claiming descent from the moon, and hence called the Lunar race (*somavamśa*), and counting among its ancestors King Bhīmatā, after whom India is called Bhāratā-varsha (land of the Bhāratas)—the succession lay between two brothers, when Dhritrāshtra, the elder, being blind, had to make way for his brother Pandu After a time the latter retired to the forest to pass the remainder of his life in hunting, and Dhritrāshtra assumed the government, assisted by his uncle, the Bhīshma, the Nestor of the poem After some years Pandu died, leaving five sons, viz., Yudhishthira, Bhīma, and Arjuna by his chief wife Kuntī, and the twins Nakula and Sahadeva by Madri The latter having burnt herself along with her dead husband, Kuntī returned with the five princes to Hastināpura, and was well received by the king, who offered to have his nephews brought up together with his own sons, and to make her the wife of his eldest son, the eldest From their great-grandfather Kuru both families are called *Kauravas*, but for distinction that name is more usually applied to the sons of Dhritrāshtra, while their cousins, as the younger line, are named, after their father, *Pāndavas* The rivalry and varying fortunes of these two houses form the main plot of the great epopee The Pāndva princes soon proved themselves greatly superior to their cousins, and Yudhishthira, the eldest of them all, was to be appointed heir-apparent But, by his son's advice, the king, good-natured but weak, induced his nephews for a time to retire from court and reside at a house where the unscrupulous Duryodhana meant to destroy them They escaped, however, and passed some time in the forest with their mother Here Draupadī, daughter of King Drupada, won by Arjuna in open combat, became the wife of the first of the brothers On that occasion they also met their cousin, Kuntī's nephew, the famous Yādava prince Krishna of Dvārakā, who ever afterwards remained their faithful friend and confidential adviser Dhritrāshtra now resolved to divide the kingdom between the two houses, whereupon the Pāndavas built for themselves the city of Indraprastha (on the site of the modern Delhi) After a time of great prosperity, Yudhishthira, in a game of dice, lost everything to Duryodhana, when it was settled that the Pāndavas should return to the forest for twelve years, but should afterwards be restored to their kingdom if they succeeded in passing an additional year in disguise, without being recognized by anyone During their forest-life they met with many adventures, among which may be mentioned their encounter with King Jayadratha of Chedi, who had carried off Draupadī from their hermitage After the twelfth year his expired they leave the forest, and, assuming various disguises, take service at the court of king Vṛata of Matsya Here all goes well for a time till the queen's brother Kichaka, a great warrior and commander of the royal forces, falls in love with

Draupadī, and is slain by Bhīma The Kauravas, profiting by Kichaka's death, now invade the Matsyan kingdom, when the Pāndavas side with king Vṛata, and there ensues, on the field of Kurukshetra, a series of fierce battles, ending in the annihilation of the Kauravas Yudhishthira now at last becomes *yuva-rāja*, and eventually king—Dhritrāshtra having resigned and retired with his wife and Kuntī to the forest, where they soon after perish in a conflagration Learning also the death of Krishna, Yudhishthira himself at last becomes tired of life and resigns his crown, and the five princes, with their faithful wife, and a dog that joins them, set out for Mount Meru, to seek admission to India's heaven On the way one by one drops off, till Yudhishthira alone, with the dog, reaches the gate of heaven, but the dog being refused admittance, the king declines entering without him, when the dog tuns out to be no other than the god of Justice himself, having assumed that form to test Yudhishthira's constancy But, finding neither his wife nor his brothers in heaven, and being told that they are in the nether world to expiate their sins, the king insists on sharing their fate, when this, too, proves a trial, and they are all reunited to enjoy perpetual bliss

Whether this story is partly based, as Lassen suggested, on historical events,—perhaps a destructive war between the neighbouring tribes of the Kurus and Panchālas,—or whether, as Dr A Holtzmann thinks, its principal features go back to Indo-Germanic times, will probably never be decided The complete work consists of upwards of 100,000 couplets,—its contents thus being nearly eight times the bulk of the *Iliad* and *Odyssey* combined It is divided into eighteen books, and a supplement, entitled Harivamśa, or genealogy of the god Hari (Krishna-Vishnu) In the introduction, Vyāsa, being about to dictate the poem, is made to say (181) that so far he and some of his disciples knew 8800 couplets; and further on (1 101) he is said to have composed the collection relating to the Bhāratas (bhārata-samhitā), and called the *Bhāratam*, which, not including the episodes, consisted of 24,000 ślokaś Now, as a matter of fact, the portion relating to the feud of the rival houses constitutes somewhere between a fourth and a fifth of the work, and it is highly probable that this portion once formed a separate poem, called the *Bhārata* But, whether the former statement is to be understood as implying the existence, at a still earlier time, of a yet shorter version of about one-third of the present extent of the leading narrative cannot now be determined While some of the episodes are so loosely connected with the story as to be readily severed from it, others are so closely interwoven with it that their removal would seriously injure the very texture of the work This, however, only shows that the original poem must have undergone some kind of revision, or perhaps repeated revisions That such has indeed taken place, at the hand of Brāhmins, for sectarian and caste purposes, cannot be doubted

The earliest direct information regarding the existence of epic poetry in India is contained in a passage of Dion Chrysostom (c 80 A.D.), according to which "even among the Indians, they say, Homer's poetry is sung, having been translated by them into their own dialect and tongue," and "the Indians are well acquainted with the sufferings of Priam, the lamentations and wails of Andromache and Hecuba, and the prowess of Achilles and Hector." Now, although these allusions would suit either poem, they seem on the whole to correspond best to certain incidents in the *Mahābhārata*, especially as no direct mention is made of a warlike expedition to a remote island for the rescue of an abducted woman, the resemblance of which to the Trojan expedition would naturally have struck a Greek becoming acquainted with the general outline of the *Rāmāyana* Whence Dion derived his information is not known; but as many leading names of the *Mahābhārata* and even the name of the poem itself² are already mentioned in Pāṇini's grammatical rules, it is

¹ There are several complete editions published in India, the handiest in 4 vols., Calcutta, 1834-9 Numerous specimens of it have been printed and translated by European scholars There is a French translation, by H Fauche, of about one half of the work, but it must be used with caution An English translation is being brought out at Calcutta by Pratap Chandra Roy

² Viz., as an adj., apparently with "war" or "poem" understood.

not only certain that the Bhārata legend must have been current in his time (c. 400 B.C.), but most probable that it existed already in poetical form, as undoubtedly it did at the time of Patañjali, the author of the "great commentary" on Pāṇini (c. 150 B.C.). The great epic is also mentioned, both as *Bhārata* and *Mahābhārata*, in the *Grihya-sūtra* of Āśvalāyana, whom Lassen supposes to have lived about 350 B.C. Nevertheless it must remain uncertain whether the poem was then already in the form in which we now have it, at least as far as the leading story and perhaps some of the episodes are concerned, a large portion of the episodical matter being clearly of later origin. It cannot, however, be doubted, for many reasons, that long before that time heroic song had been diligently cultivated in India at the courts of princes and among Kshatriyas, the knightly order, generally. In the *Mahābhārata* itself the transmission of epic legend is in some way connected with the Sūtras, a social class which, in the caste-system, is defined as resulting from the union of Kshatriya men with Bāhmanas women, and which supplied the office of charioters and heralds, as well as (along with the Māgadhas) that of professional minstrels. Be this as it may, there is reason to believe that, as Hellas had her *dōdōi* who sang the *κλέα ἀνδρῶν*, and Iceland her skalds who recited favourite sagas, so India had from olden times her professional bards, who delighted to sing the praises of kings and inspire the knights with warlike feelings. But if in this way a stock of heroic poetry had gradually accumulated which reflected an earlier state of society and manners, we can well understand why, after the Brāhmanical order of things had been definitely established, the priests should have deemed it desirable to subject these traditional memorials of Kshatriya chivalry and prestige to their own censorship, and adapt them to their own canons of religious and civil law. Such a revision would doubtless require considerable skill and tact; and if in the present version of the work much remains that seems contrary to the Brāhmanical code and pretensions—e.g., the polyandric union of Draupadi and the Pāṇdu princes—the reason probably is that such legendary, or it may be historical, events were too firmly rooted in the minds of the people to be tampered with, and all the clerical revisers could do was to explain them away as best they could. Thus the special point alluded to was represented as an act of duty and filial obedience, in this way, that, when Arjuna brings home his fair prize, and announces it to his mother, she, before seeing what it is, bids him share it with his brothers. Nay, it has even been suggested, with some plausibility, that the Brāhmanical editors have completely changed the traditional relations of the leading characters of the story. For, although the Pāṇdavas and their cousin Krishna are constantly extolled as models of virtue and goodness, while the Kauravas and their friend Kama—a son of the sun-god, born by Kuntī before her marriage with Pāṇdu, and brought up secretly as the son of a Sūta—are denoted as monsters of depravity, these estimates of the heroes' characters are not unfrequently belied by their actions,—especially the honest Kama and the brave Duryodhana contrasting not unfavourably with the wily Krishna and the cautious and somewhat effeminate Yudhishtira. These considerations, coupled with certain peculiarities on the part of the Kauravas, suggestive of an original connexion of the latter with Buddhist institutions, have led Dr Holtzmann to devise an ingenious theory, viz., that the traditional stock of legends was first worked up into its present shape by some Buddhist poet, and that this version, showing a decided predilection for the Kuru party, as the representatives of Buddhist principles, was afterwards revised in a contrary sense, at the time of the

Brāhmanical reaction, by votaries of Vishnu, when the Buddhist features were generally modified into Saivite tendencies, and prominence was given to the divine nature of Krishna, as an incarnation of Vishnu. The chief objection to this theory probably is that it would seem to make such portions as the *Bhagavad-gītā* ("song of the holy one")—the famous theosophic episode in which Krishna, in lofty and highly poetical language, expounds the doctrine of faith (bhakti) and claims adoration as the incarnation of the supreme spirit—even more modern than many scholars may be inclined to admit as at all necessary, considering that at the time of Patañjali's *Mahābhārata* the Krishna worship, as was shown by Prof. Bhandarkar, had already attained some degree of development. Of the purely legendary matter incorporated with the leading story not a little, doubtless, is at least as old as the latter itself. Some of these episodes—especially the well-known story of Nala and Damayanti, and the touching legend of Sāvitrī—form themselves little epic gems, of which any nation might be proud. There can be no doubt, however, that this great storehouse of legendary lore has received considerable additions down to comparatively recent times, and that, while its main portion is considerably older, it also contains no small amount of matter which is decidedly more modern than the *Rāmāyana*.

As regards the leading narrative of the *Rāmāyana*, while it is generally supposed that the chief object which the poet had in view was to depict the spread of Aryan civilization towards the south, Mr T. Wheeler has tried to show that the demons of Lankā against whom Rāma's expedition is directed are intended for the Buddhists of Ceylon. Prof. Weber, moreover, from a comparison of Rāma's story with cognate Buddhist legends in which the expedition to Lankā is not even referred to, has endeavoured to prove that this feature, having been added by Vālmiki to the original legend, was probably derived by him from some general acquaintance with the Trojan cycle of legends, the composition of the poem itself being placed by the same scholar somewhere about the beginning of the Christian era. Though, in the absence of positive proof, this theory, however ably supported, can scarcely be assented to, it will hardly be possible to put the date of the work farther back than about a century before our era; while the loose connexion of certain passages in which the divine character of Rāma, as an avatar of Vishnu, is especially accentuated, raises a strong suspicion of this feature of Rāma's nature having been introduced at a later time.

A remarkable feature of this poem is the great variation of its text in different parts of the country, amounting in fact to several distinct recensions. The so-called Gauda recension, current in Bengal, which differs most of all, has been edited, with an Italian translation, by G. Gorresio, while the version prevalent in western India, and published at Bombay, has been made the basis for a beautiful poetical translation by Mr R. Griffith. This diversity has never been explained in a quite satisfactory way, but it was probably due to the very popularity and wide oral diffusion of the poem. Yet another version of the same story, with, however, many important variations of details, forms an episode of the *Mahābhārata*, the relation of which to Vālmiki's work is still a matter of uncertainty. To characterize the Indian epics in a single word—though often disguised by grotesque fancies and wild exaggerations, they are yet noble works, abounding in passages of remarkable descriptive power, intense pathos, and high poetic grace and beauty, and, while, as works of art, they are far inferior to the Greek epics, in some respects they appeal far more strongly to the romantic

mind of Europe, namely, by their loving appreciation of natural beauty, their exquisite delineation of womanly love and devotion, and their tender sentiment of mercy and forgiveness.

Purāṇas

2. *Purāṇas and Tāntaras*.—The *Purāṇas* are partly legendary partly speculative histories of the universe, compiled for the purpose of promoting some special, locally prevalent form of Brāhmanical belief. They are sometimes styled a fifth Veda, and may indeed in a certain sense be looked upon as the scriptures of Brāhmanical India. The term *puṛāṇa*, signifying "old," applied originally to prehistoric, especially cosmogonic, legends, and then to collections of ancient traditions generally. The existing works of this class, though recognizing the Brāhmanical doctrine of the Trimūrti, or triple manifestation of the deity (in its creative, preservative, and destructive activity), are all of a sectarian tendency, being intended to establish, on quasi-historic grounds, the claims of some special god, or holy place, on the devotion of the people. For this purpose the compilers have pressed into their service a mass of extraneous didactic matter on all manner of subjects, whereby these works have become a kind of popular encyclopedias of useful knowledge. It is evident, however, from a comparatively early definition given of the typical *Purāṇa*, as well as from numerous coincidences of the existing works, that they are based on, or enlarged from, older works of this kind, more limited in their scope, and probably of a more decidedly tritheistic tendency of belief. Thus none of the *Purāṇas*, as now extant, is probably much above a thousand years old, though a considerable proportion of their materials is doubtless much older, and may perhaps in part go back to several centuries before our era.

In legendary matter the *Purāṇas* have a good deal in common with the epics, especially the *Mahābhārata*,—the compilers or revisers of both classes of works having evidently drawn their materials from the same fluctuating mass of popular traditions. They are almost entirely composed in epic couplets, and indeed in much the same easy flowing style as the epic poems, to which they are, however, greatly inferior in poetic value.

According to the traditional classification of these works, there are said to be eighteen (*śaṣṭi*, or great) *Purāṇas*, and as many *Upa-purāṇas*, or subordinate *Purāṇas*. The former are by some authorities divided into three groups of six, according as one or other of the three primary qualities of external existence—goodness, darkness (ignorance), and passion—is supposed to prevail in them, viz. the *Viṣṇu*, *Nārāyaṇa*, *Bhāgavata*, *Garuda*, *Pañcama*, *Varāha*,—*Matsya*, *Kṛma*, *Linga*, *Śiva*, *Skanda*, *Āgnyā*,—*Brahmaṇḍa*, *Brahma-vasara*, *Mārkaṇḍeya*, *Bhaviṣya*, *Pāṇana*, and *Brahma-Purāṇas*. In accordance with the nature of the several names of the Trimūrti, the first two groups chiefly devote themselves to the commendation of Viṣṇu and Śiva respectively, whilst the third group, which would properly belong to Brahma, has been largely appropriated for the promotion of the claims of other deities, viz. Viṣṇu in his sensuous form of Krishna, Devī, Gaṇeśa, and Śiṛya. As Prof Banerjee has shown in his preface to the *Mārkaṇḍeya*, this seems to have been chiefly effected by later additions and interpolations. The insufficiency of the above classification, however, appears from the fact that it omits the *Vāyu-purāṇa*, probably one of the oldest of all, though some MSS substitute it for one or other name of the second group. The eighteen principal *Purāṇas* are said to consist of together 400,000 couplets. In Northern India the Vaishnava *Purāṇas*, especially the *Bhāgavata* and *Viṣṇu*,¹ are by far the most popular. The *Bhāgavata* was formerly supposed to have been composed by Vopadeva, the grammarian, who lived in the 15th century. It has, however, been shown² that what he wrote was a synopsis of the *Purāṇa*,

¹ There are several Indian editions of these two works. The *Bhāgavata* has been partly printed, in an *édition de luxe*, at Paris, in 8 vols., by E. Burnouf, and a fourth by M. Havet-Besseli. Of the *Viṣṇu* there is a translation by H. H. Wilson, ed. enriched with valuable notes by F. Hall. Several other *Purāṇas* have been printed in India; the *Mārkaṇḍeya* and *Āgnyā Purāṇa*, in the *Bibl. Ind.*, by Prof. Banerjee and Rājendralāla Mitra respectively.

² Rājendralāla Mitra, *Notices of Sanskrit MSS.*, u. 47.

and that the latter is already quoted in a work by Ballala Sena of Bengal, in the 11th century.

From the little we know regarding the *Upa-purāṇas*, their character does not seem to differ very much from that of the principal *Purāṇas*. One of them, the *Brahmaṇḍa-purāṇa*, contains, as an episode, the well-known *Ādhyātma-Rāmāyaṇa*, a kind of spiritual version of Valmiki's poem. Besides these two classes of works there is a large number of so-called *Śilpa-purāṇas*, or chronicles recounting the history and merits of some holy "place" or shrine, where their recitation usually forms an important part of the daily service. Of much the same nature are the numerous *Mūḍhāyaga* (literally "relating to the great spirit"), which usually profess to be sections of one or other *Purāṇa*. Thus the *Devi-pūjārāga*, which celebrates the victories of the great goddess Durgā over the Asuras, and is daily read at the temples of that deity, forms a section, though doubtless an interpolated one, of the *Mārkaṇḍeya-purāṇa*.

The *Tāntaras*, which have to be considered as a later *Tāntara* development of the sectarian *Purāṇas*, are the sacred writings of the numerous *Śāktas*, or worshippers of the female energy (*śakti*) of some god, especially the wife of Śiva, in one of her many forms (Pārvatī, Devī, Kālī, Dhavānī, Durgā, &c.). This worship of a female representation of the divine power appears already in some of the *Purāṇas*, but in the *Tāntaras* it assumes quite a peculiar character, being largely intermixed with magic performances and mystic rites, partly, it would seem, of a grossly immoral nature. This class of writings does not appear to have been in existence at the time of Amarasimha (6th century), but they are mentioned in some of the *Purāṇas*. They are usually in the form of a dialogue between Śiva and his wife. Their number is very large, but they still await a critical examination at the hands of western scholars. Among the best known may be mentioned the *Kuṇḍa-yāmala*, *Kuṇḍa-nava*, *Syāma-rahasya*, and *Kālikā-tāntara*.

3. *Modern Epics*.—A new class of epic poems begin to Modern make their appearance about the 5th or 6th century of ^{epics} our era, during a period of renewed literary activity which has been fitly called³ the Renaissance of Indian literature. These works differ widely in character from those that had preceded them. The great national epics, composed though they were in a language different from the ordinary vernaculars, had at least been drawn from the living stream of popular traditions, and were doubtless readily understood and enjoyed by the majority of the people. The later productions, on the other hand, are of a decidedly artificial character, and must necessarily have been beyond the reach of any but the highly cultivated. They are, on the whole, singularly deficient in incident and invention, their subject matter being almost entirely derived from the old epics. Nevertheless, these works are by no means devoid of merit and interest, and a number of them display considerable descriptive power and a wealth of genuine poetic sentiment, though unfortunately often clothed in language that deprives it of half its value. The simple heroic couplet has mostly been discarded for various more or less elaborate metres, and in accordance with this change of form the diction becomes gradually more complicated,—a growing taste for unwieldy compounds, a jingling kind of alliteration, or rather agnomination, and an abuse of similes marking the increasing artificiality of these productions.

The generic appellation of such works is *kāvya*, which, meaning "poem," or the work of an individual poet (*kavi*), is already applied to the *Rāmāyaṇa*. Six poems of this kind are singled out by native rhetoricians as standard works, under the title of *Mahā-kāvya*, or great poems. Two of these are ascribed to the famous dramatist Kālidāsa, the most prominent figure of the Indian Renaissance, and truly a master of the poetic art. He is said to have been one of the nine literary "gems" at the court of Vikramāditya, now generally identified with King Vikramāditya Harsha of Ujjayini (Ujjain or Oudh), who reigned about the middle of the 6th century, and seems to have originated the Vikramāditya era, reckoned from 56 c. Of the poets whose works have come down

³ M. Muller, *India. What can it teach us?* note G.

to use Kālidāsa appears to be one of the earliest, but there can be little doubt that he was preceded in this as in other departments of poetic composition by many lesser lights, eclipsed by the sun of his fame, and forgotten. Of the six "great poems" named below the first two are those attributed to Kālidāsa. (1) The *Jaghanya-vansha*, or "race of Jaghu," celebrates the ancestry and deeds of Bāma. The work, consisting of nineteen cantos, is manifestly incomplete, but hitherto no copy has been discovered of the six additional cantos which are supposed to have completed it. (2) The *Kumāra-sambhava*,¹ or "the birth of the (war-god) Kumāra" (or Skanda), the son of Siva and Pārvatī, consists of eight cantos, the last of which has only recently been made public, being usually omitted in the MSS, probably on account of its atrocious character rendering it unsuitable for educational purposes, for which the works of Kālidāsa are extensively used in India. Nine additional cantos, which were published at the same time, have been proved to be spurious. Another poem of this class, the *Nalodaya*,² or "rise of Nala,"—describing the restoration of that king, after having lost his kingdom through gambling,—is wrongly ascribed to Kālidāsa, being far inferior to the other works, and of a much more artificial character. (3) The *Kṛtiśālinī*,³ or "combat between the Pāṇḍava princes Arjuna and the god Śiva, in the guise of a Kūta or wild mountaineer," is a poem in eighteen cantos, by Bhṛaru, probably a contemporary of Kālidāsa, being mentioned together with him in an inscription dated 634 A.D. (4) The *Śiṣupāla-badhā*, or slaying of Śiṣupāla, who, being a prince of Chedi, reviled Kṛṣṇa, who had carried off his intended wife, and was killed by him at the instigation of Śakuni, the dhaṁṣṭhī, is a poem consisting of three cantos, attributed to Māgha,⁴ whence it is also called *Māgha-kāvya*. (5) The *Rāvana-badhā*, or "slaying of Rāvana," more commonly called *Bhātā-kāvya*, to distinguish it from other poems (especially one by Pravarasena), likewise bearing the former title, was composed for the practical purpose of illustrating the less common grammatical forms and the figures of rhetoric and poetry. In its closing couplet it professes to have been written at Vallabhi, under Śrīharasena, but, several princes of that name being mentioned in inscriptions as having ruled there in the 6th and 7th centuries, its exact date is still uncertain. Bhatti, apparently the author's name, is usually identified with the well-known grammarian Bhaṭṭarī, whose death Prof. M. Müller, from a Chinese statement, fixes at 655 A.D., while others make him Bhaṭṭarī's son. (6) The *Mahābhārata*, or *Śānta-dharmā*, the life of Nala, king of Nishadga, is ascribed to Śrī-Harsha (son of Hīra), who is supposed to have lived in the latter part of the 12th century. A small portion of the simple and noble episode of the *Mahābhārata* is here retold in highly elaborate and polished stanzas, and with a degree of lasciviousness which (unless it be chiefly due to the poet's exuberance of fancy) gives a truly appalling picture of social corruption. Another highly interesting poem, the *Bhāgavata-kāvya*, composed by Kavyānanda of Kung of Poona,—whose date is uncertain, though some scholars place him later than the 10th century,—is characteristic of the trifling uses to which the poet's art was put. The well-turned stanzas are so ambiguously worded that this poem may be interpreted as relating to the leading story of either the *Rāmāyana* or the *Mahābhārata*.

A still more modern popular development of these artificial poems are the numerous so-called *Champū*, being compositions of mixed verse and prose. As specimens of such works may be mentioned the *Champū-rāmāyana* or *Bhāga-champū*, in five books, by Bhojarāja (or Vīderābhāṇa) Pandita, being popular abstracts of the two great epics.

Very similar in character to the artificial epics are the panegyrics, composed by court poets in honour of their patrons. Such productions were probably very numerous; but only two of any special interest are hitherto known, viz., the *Śrī-Taranga-charita*, composed in ornate prose, by Bhaṇa, in honour of Śūlāditya Haṣṭavardhana (c. 610-650 A.D.) of Kanyakubja (Kanau), and the *Vikramānaka-charita*,⁵ written by the Kashmir poet Bīlhana, about 1085, in honour of his patron, the Chālikya king Vikramāditya of Kalyāna, regarding the history of whose dynasty the work supplies much valuable information. The latter work may also be mentioned as composed in accordance with the Hindu poetic canon, the *Bhāgavata-rāgaṇṭa*,⁶ or chronicle of the kings of Kashmir, the only important

historical work in the Sanskrit language, though even here considerable allowance has to be made for poetic licence and fancy. The work was composed by the Kashmirian poet Kālhana, about 1150, and was afterwards continued by three successive supplements, bringing down the history of Kashmir to the time of the emperor Akbar. Unfortunately the two existing editions were prepared from very imperfect MSS materials, but Dr. Bühler's discovery of new MSS, as well as of some of the works on which Kālhana's poem is based, ought to enable the native scholar (Prof. Bhandarkar) who has undertaken a new edition to put the text in a more satisfactory condition.

4. *The Drama*.—The early history of the Indian drama. Drama is enveloped in obscurity. The Hindus themselves ascribe the origin of dramatic representation to the sage Bharata,

who is fabled to have lived in remote antiquity, and to have received this science directly from the god Brahma, by whom it was extracted from the Veda. The term *Bharata*—(?) i.e., one who is kept, or one who sustains (a part)—also signifies "an actor", but it is doubtful which of the two is the earlier,—the appellative use of the word, or the notion of an old teacher of the dramatic art bearing that name. On the other hand, there still exists an extensive work, in epic verse, on rhetoric and dramaturgy, entitled *Nāṭya-sāstra*, and ascribed to Bharata. But, though this is probably the oldest theoretic work on the subject that has come down to us, it can hardly be referred to an earlier period than several centuries after the Christian era. Not improbably, however, this work, which presupposes a fully developed scenic art, had an origin similar to that of some of the metrical law-books, which are generally supposed to be popular and improved editions of older sūtra-works. We know that such treatises existed at the time of Pāṇini, as he mentions two authors of *Nāṭya-sūtras*, or "rules for actors," viz., Śāliha and Kṛtāśiva. Now, the words *nāṭa* and *nāṭya*—as well as *nāṭika*, the common term for "drama"—being derived from the root *nat* (*naṭi*) "to dance," seem to point to a pantomimic or choral origin of the dramatic art. It might appear doubtful, therefore, in the absence of any clearer definition in Pāṇini's grammar, whether the "actors' rules" he mentions did not refer to mere pantomimic performances. Fortunately, however, Patañjali, in his "great commentary," speaks of the actor as angling, and of people going "to hear the actor." Nay, he even mentions two subjects, taken from the cycle of Vishnu legends—viz., the slaying of Kamsa (by Kṛṣṇa) and the binding of Bali (by Vishnu)—which were represented on the stage both by mimic action and declamation. Judging from these allusions, theatrical entertainments in those days seem to have been very much on a level with our old religious spectacles or mysteries, though there may already have been some simple kinds of secular plays which Patañjali had no occasion to mention. It is not, however, till some five or six centuries later that we meet with the first real dramas, which mark at the same time the very culminating point of Indian dramatic composition. In this, as in other departments of literature, the earlier works have had to make way for later and more perfect productions, and no trace now remains of the intermediate phases of development.

Here, however, the problem presents itself as to whether the existing dramatic literature has naturally grown out of such popular religious performances as are alluded to by Patañjali, or whether some foreign influence has intervened at some time or other and given a different direction to dramatic composition. The question has been argued both for and against the probability of Greek influence; but it must still be considered as *sub judice*. There are doubtless some curious points of resemblance between the Indian drama and the Modern Attic (and Roman) comedy, viz., the prologue, the occasional occurrence of a token of recognition, and a certain correspondence of characteristic stage figures (especially the

¹ Edited, with a Latin transl., by F. Stenzler; also text, and commentary, by S. P. Pandit.

² Text and Latin transl. published by F. Stenzler, an English transl. by R. T. H. Griffith.

³ Text, with commentary, Latin transl., edited by F. Benary, Engl. transl., in verse, by Dr. Taylor.

⁴ Editions of this and the three following poems have been published in India.

⁵ Bhaṇa Dēy, in his paper on Kālidāsa, calls Māgha "a contemporary of the Bhāga of the 11th century." ⁶ Edited by G. Bühler.

⁷ Published at Calcutta; also, with a French transl., by A. Troyer.

Viddhaka, or jocosé companion of the hero, presenting a certain analogy to the servus of the Roman stage, as does the Vita of some plays to the Roman parasite)—for which the assumption of some acquaintance with the Greek comedy on the part of the earlier Hindu writers would afford a ready explanation. On the other hand, the differences between the Indian and Greek plays are perhaps even greater than their coincidences, which, moreover, are scarcely close enough to warrant our calling in question the originality of the Hindus in this respect. Certain, however, it is that, if the Indian poets were indebted to Greek playwrights for the first impulse in dramatic composition, in the higher sense, they have known admirably how to adapt the Hellenic muse to the national genius, and have produced a dramatic literature worthy to be ranked side by side with both the classical and our own romantic drama. It is to the latter especially that the general character of the Indian play presents a striking resemblance, much more so than to the classical drama. The Hindu dramatist has little regard for the "unities" of the classical stage, though he is hardly ever guilty of extravagance in his disregard of them. The dialogue is invariably carried on in prose, plentifully interspersed with those neatly turned lyrical stanzas in which the Indian poet delights to depict some natural scene, or some temporary physical or mental condition. The most striking feature of the Hindu play, however, is the mixed nature of its language. While the hero and leading male characters speak Sanskrit, women and inferior male characters use various Prakṛit dialects. As regards these dialectic varieties, it can hardly be doubted that at the time when they were first employed in this way they were local vernacular dialects, but in the course of the development of the scenic art they became permanently fixed for special dramatic purposes, just as the Sanskrit had, long before that time, become fixed for general literary purposes. Thus it would happen that these Prakṛit dialects, having once become stationary, soon diverged from the spoken vernaculars, until the difference between them was as great as between the Sanskrit and the Prakṛits. As regards the general character of the dramatic Prakṛits, they are somewhat more removed from the Sanskrit type than the Pāli, the language of the Buddhist canon, which again is in a rather more advanced state than the language of the Aśoka inscriptions (c. 250 B.C.). And, as the Buddhist sacred books were committed to writing about 80 B.C., the state of their language is attested for that period at latest, while the grammatical fixation of the scenic Prakṛits has probably to be referred to the early centuries of our era.

The existing dramatic literature is not very extensive. The number of plays of all kinds of any literary value will scarcely amount to fifty. The reason for this paucity of dramatic productions doubtless is that they appealed to the tastes of only a limited class of highly cultivated persons, and were in consequence but seldom acted. As regards the theatrical entertainments of the common people, their standard seems never to have risen much above the level of the religious spectacles mentioned by Patañjali. Such at least is evidently the case as regards the modern Bengālī *śāstras*—described by Wilson as exhibitions of some incidents in the youthful life of Kṛṣṇa, maintained in extempore dialogue, interspersed with popular songs—as well as the similar *rāsas* of the western provinces, and the rough and ready performances of the *bhāṇṇ*, or professional buffoon. Of the religious drama Sanskrit literature offers but one example, viz., the famous *Gītāgovindā*,¹ composed by Jayadeva in the 12th century. It is rather a mytho-lyrical poem, which, however, in the opinion of Lassen, may be considered as a modern and refined specimen of the early form of dramatic composition. The subject of the poem is as follows.—Kṛṣṇa, while leading a cowherd's life in Vrindāvana, is in love with Rādhā, the milkmaid, but has been faithless to her for a while. Presently, however, he returns to her

"whose image has all the while lingered in his breast," and after much earnest entreaty obtains her forgiveness. The emotions appropriate to these situations are expressed by the two lovers and a friend of Rādhā in melodious and passionate stanzas of great poetic beauty. Like the Song of Solomon, the Gītāgovindā, moreover, is supposed by the Hindu commentators to admit of a mystic interpretation, for "As Kṛṣṇa, faithless for a time, represents the vanity of all other loves, and returns with sorrow and longing to his own darling Rādhā, so the human soul, after a brief and frantic attachment to objects of sense, burns to return to the God from whence it came" (Giffith).

The *Michekhalālakā*,² or "earthen toy-cart," is by tradition Śādraka, placed at the head of the existing dramas, and a certain clumsiness of construction seems indeed to justify this distinction, according to several stanzas in the prologue, the play was composed by a king Śūdraka, who is there stated to have, through Śiva's favour, recovered his eyesight, and, after seeing his son as king, to have died at the ripe age of a hundred years and ten days. According to the same stanzas, the piece was enacted after the king's death, but it is probable that they were added for a subsequent performance. In Bāṇa's novel *Kālidāsa* (c. 630 A.D.), the king Śādraka, probably the same, is represented as having resided at Bidāś (Bhūla)—some 180 miles east of Ujjayini (Ujjain), where the scene of the play is laid. Chārudatta, a Brāhman merchant, reduced to poverty, and Vasantasenā, an accomplished courtesan, meet and fall in love with each other. This forms the main story, which is interwoven with a political underplot, resulting in a change of dynasty. The connection between the two plots is effected by means of the king's rascally brother-in-law, who pursues Vasantasenā with his advances, as well as by the part of the rebellious cowherd Aiyaka, who, having escaped from prison, finds shelter in the hero's house. The wicked prince, on being rejected, stangles Vasantasenā, and accuses Chārudatta of having murdered her, but, just as the latter is about to be executed, his lady love appears again on the scene. Meanwhile Aiyaka has succeeded in deposing the king, and, having himself mounted the throne of Ujjayini, he raises Vasantasenā to the position of an honest woman, to enable her to become the wife of Chārudatta. The play is one of the longest, consisting of not less than ten acts, some of which, however, are very short. The interest of the action is, on the whole, well sustained, and, altogether, the piece presents a vivid picture of the social manners of the time.

In Kālidāsa (c. 550 A.D.) the drama art attained its highest point of perfection. From this accomplished poet we have three well-constructed plays, abounding in stanzas of exquisite tenderness and fine descriptive passages, viz., the two well-known mytho-pastoral dramas, *Sakuntalā* in seven and *Vikramorvaśī*³ in five acts, and a piece of court intrigue, distinctly inferior to the other two, entitled *Mālikaṁkṛāntā*,⁴ in five acts. King Agramitra, who has two wives, falls in love with Mālavikā, the favourite of his first wife. His wives endeavour to frustrate their affection for each other, but in the end Mālavikā turns out to be a princess by birth, and is accepted by the queens as their sister.

In the prologue to this play, Kālidāsa mentions Bhāsa and Saumilla as his predecessors in dramatic composition. Of the former poet some six or seven stanzas have been gathered from anthologies by Prof. Aufrecht, who has also brought to light one fine stanza ascribed to Rāmilāsa and Saumilla.

Śrī Harsha-deva—whom Dr F. Hall has proved to be identical Harsha—with King Śīlāditya Haṣavardhana of Kānyakubja (Kannauj), deva who reigned in the first half of the 7th century—has three plays attributed to him. Most likely, however, he did not write any of them himself, but they were only dedicated to him as the patron of their authors. Such at least seems to have been the case as regards the *Kālidāsa*,⁵ which was probably composed by Bhāsa. It is a graceful drama of genteel domestic manners, in four acts, of no very great originality, the author having been largely indebted to Kālidāsa's plays. Rāmāvalī, a Ceylon princess, is sent by her father to the court of King Vatsa to become his second wife. She suffers shipwreck, but is rescued and received into Vatsa's palace as one of queen Vāsavadattā's attendants. The king falls in love

¹ Edited by F. Stenzler, translated by H. H. Wilson, German by O. Bohtlingk and L. Fritz, French by P. Regnaud.

² Both these plays are known in different recensions in different parts of India. The Bengālī recension of the *Sakuntalā* was translated by Sir W. Jones, and into French, with the text, by Chézy, and again edited critically by R. Pischel, who has also abstracted its greater antiquity. Editions and translations of the western (Devanāgarī) recension have been published by O. Bohtlingk and Mon. Williams. The *Vikramorvaśī* has been edited critically by S. P. Pandit, and the southern text by R. Pischel. It has been translated by H. H. Wilson and E. B. Cowell.

³ Edited critically by S. P. Pandit; transl. by C. H. Tawney, and previously into German by A. Weber.

⁴ Edited by Thāradāsa Tarkavāchaspah, and by C. Cappeller in Bohtlingk's *Sanskrit-Chrestomathie*, translated by H. H. Wilson.

⁵ Ed., with a Latin transl., by O. Lassen, Engl. transl. by R. Arnold.

with her, and the queen tries to keep them apart from each other, but, on learning the maiden's origin, she becomes reconciled, and recognises her as a "sister." According to H. H. Wilson, "the manners depicted are not influenced by lofty principle or profound reflection, but they are mild, affectionate, and elegant." It may be doubted whether the last two of other eastern nations, either in ancient or modern times, would afford materials for as favourable a delineation. Very similar in construction, but distinctly inferior, is the *Prayodhisā*, in four acts, lately published in India, having for its plot another amour of the same king. The scene of the third play, the *Nāgānanda*,¹ or "joy of the serpents" (in five acts), on the other hand, is laid in semi-divine regions. Jīmīyādhara, a prince of the Vidyādahs, imbued with Buddhist principles, weds Marīcī, daughter of the king of the Siddhās, a votary of Gaṇi (Śiva's wife). But, learning that Gaṇda, the mythic bird, is in the habit of consuming one snake daily, he resolves to offer himself to the bird as a victim, and finally succeeds in converting Gaṇda to the principle of ahimsā, or abstention from doing injury to living beings, but he himself is about to succumb from the wounds he has received, when, though the timely intervention of the goddess Gaṇi, he is restored to his former condition. The piece seems to have been intended as a compromise between Brāhmanical (Śaiva) and Buddhist doctrines, being thus in keeping with the religious views of King Harsha, who, as we know from Huen-tsang, favoured Buddhism, but was very tolerant to Brāhmins. It begins with a benedictory stanza to Buddha, and concludes with one to Gaṇi! The author is generally believed to have been a Buddhist, but it is more likely that he was a Śaiva Brāhmin, possibly Dhana himself. Nay, one might almost feel inclined to take the hero's self-sacrifice in favour of a Nāga as a travesty of Buddhist principles.

Bhavabhūti, surnamed Śrī-kāṇṭha, "whose throat is beauty (eloquence)," was a native of Padmapura in the Velaṅkha country (the Betars), being the son of the Brāhmin Nīlākhaṇṭha, and his wife Jātīkāṁi. He is said to have passed his literary life at the court of Yaśovarman of Kanauj, who is supposed to have reigned in the latter part of the 7th and beginning of the 8th century. Bhavabhūti was the author of three plays, two of which, the *Mahāvīrācharīya* ("life of the great hero") and the *Uttarādhyaśchaya* ("later life of Rāma"), in seven acts each, form together a dramatized version of the story of the *Rāmāyana*. The third, the *Māliki-nāṭya*, is a domestic drama in ten acts, representing the fortunes of Madhava and Māliki, the son and daughter of two ministers of neighbouring kings, who from childhood have been destined for each other, but, by the resolution of the maiden's royal master, to marry her to an old and ugly favourite of his, are for a while threatened with permanent separation. The action of the play is full of life, and abounds in stirring, though sometimes improbable, incidents. The poet is considered by native pundits to be not only not inferior to Kālidāsa, but even to have surpassed him in his *Uttarādhyaśchaya*. But, though he ranks decidedly high as a lyric poet, he is far inferior to Kālidāsa as a dramatic artist. Whilst the latter delights in depicting the gentle feelings and tender emotions of the human heart and the peaceful scenes of rural life, the younger poet finds a peculiar attraction in the sterner and more imposing aspects of nature and the human character. Bhavabhūti's language, though polished and felicitous, is elaborate and artificial compared with that of Kālidāsa, and his genius is sorely shackled by a slavish adherence to the arbitrary rules of dramatic theorists.

Bhaṭṭa Nārāyaṇa, surnamed Mīrāṇḍa or Simha, "the lion," the author of the *Vaṁśavahāra* ("the song by the brand of hare"), is a poet of uncertain date. Tradition makes him one of the five Kanauj Brāhmins whom King Aśvadhara of Bengal, desirous of establishing the pure Vaiṣṇava doctrine, invited to his court, and from whom the modern Bengali Brāhmins are supposed to be descended. The date of the event, however, is itself doubtful, while a modern German scholar fixes it at 1077. Lessen refers it to the beginning of the 7th century and Gull to the latter part of the 6th. If it could be proved that the poet is identical with the Nārāyaṇa whom Bāna (c. 480) mentions as being his friend, the question would be settled in favour of the earlier calculations. The play, consisting of six acts, is founded on the story of the *Mahābhārata*, and takes its title from the insult offered to Draupadī by one of the Kaurava princes, who, when he had been lost at dice by Yudhiṣṭhira, dragged her by the hair into the assembly. The piece is composed in a style similar to that of Bhavabhūti's plays, though less polished, and inferior to them in dramatic construction and poetic merit.

The *Hanauka-nāṭaka* is a dramatized version of the story of Rāma, interspersed with numerous purely descriptive poetic passages. It consists of fourteen acts, and on account of its length is also called the *Mahā-nāṭaka*, or great drama. Tradition relates that it was composed by Hanumān, the monkey general, and ascribed on rocks, but Viluṁḍa, the author of the *Rāmāyana*, being afraid lest it might throw his own poem into the shade, Hanumān allowed him to cast his verses into the sea. Thence fragments were ultimately picked up by a merchant, and brought to King Dhoga, who directed the poet Dāmodara Mīśra to put them together, and fill up the lacunae, whence the present composition originated. Whatever particle of truth there may be in this story, the "great drama" seems certainly to be the production of different hands. "The language," as Wilson remarks, "is in general very harmonious, but the work is after all a most disjointed and non-descript composition, and the patchwork is very glaringly and clumsily put together." It is nevertheless a work of some interest, as compositions of mixed dramatic and declamatory passages of this kind may have been common in the early stages of the dramatic art. The connexion of the poet with King Dhoga, also confirmed by the *Prabodha-chandrika*, would bring the composition, or final redaction, down to about the 10th or 11th century. There are, however, two different versions of the work, a shorter one commented upon by Mohanādāsa, and a longer one attributed by Madhusūdana. A Dāmodara Guṇya is mentioned as having lived under Jaypīda of Kāshīm (755-86), but this can scarcely be the same author.

The *Mudrārāshasa*,² or "Rāshasa (the minister) with the signet," is a drama of political intrigue, in seven acts, partly based on historical events, the plot turning on the reconciliation of Rāshasa, the minister of the murdered King Nanda, with the hostile party, consisting of prince Chandraguṇya (the Greek Sandrocottus, 315-291 B.C.), who succeeded Nanda, and his minister Chāṇakya. The plot is developed with considerable dramatic skill, in vigorous, if not particularly elegant, language. The play was composed by Viśākhadatta, prior, at any rate, to the 11th century, but perhaps as early as the 7th or 8th century, as Buddhism is referred to in it in rather complimentary terms.

The *Prabodha-chandrika*,³ or "the moon-rise of intelligence," composed by Kuśhāmānasa about the 12th century, is an allegorical play, in six acts, the *dramatic personae* of which consist entirely of abstract ideas, divided into two conflicting hosts.

Of numerous inferior dramatic compositions we may mention as the best—the *Aśva-guṇya-dhāra*, by Mūlīn, the *Bāla-nāṭya*, or *dhāra*, one of six plays (three of which are known) by Rājasekhara, and the *Prasanna-dhāra*, by Jayadeva, the author of the rhetorical treatise *Chandīka*. Abstracts of a number of other pieces are given in H. H. Wilson's *Hindu Theatre*, the standard work on this subject. The dramatic genius of the Hindus may be said to have exhausted itself about the 14th century.

5. *Lyrical, Descriptive, and Didactic Poetry*.—We have hitherto already alluded to the marked predilection of the mediæval poetry Indian poet for depicting in a single stanza some peculiar physical or mental situation. The profane lyrical poetry consists chiefly of such little poetic pictures, which form a prominent feature of dramatic compositions. Numerous poems and poetesses are only known to us through such detached stanzas, preserved in native anthologies or manuals of rhetoric. Thus the *Saduktikarmāṇṭra*,⁴ or "ear-ambrosia of good sayings" an anthology compiled by Siddhara Dāsa in 1205, contains verses by four hundred and forty-six different writers, while the *Sārngadhara-paddhati*, another anthology, of the 14th century, contains some 6000 verses culled from two hundred and sixty-four different writers and works. These verses are either of a purely descriptive or of an erotic character, or they have a didactic tendency, being intended to convey, in an attractive and easily remembered form, some moral truth or useful counsel. An excellent specimen of a longer poem, of a partly descriptive partly erotic character, is Kālidāsa's *Megha-dūta*,⁵ or "cloud messenger," in which a banished Yaksha (demi-god) sends a love-message across India to his wife in the Himālaya, and describes, in verse-pictures, the various places and objects over which the messenger, a

⁴ Rājendralāla Mitra, *Notices*, n. p. 184.

⁵ Text and transl., by H. H. Wilson, with vocabulary by S. Johnson.

cloud, will have to sail in his airy voyage. This little masterpiece has called forth a number of more or less successful imitations, such as Lakshmidāsa's *Sūta-saundāra*, or "parrot-message," lately edited by the mahāśāya of Travancore. Another much admired descriptive poem by Kālidāsa is the *Ritu-saundhā*, or "collection of the seasons," in which the attractive features of the six seasons are successively set forth.

As regards religious lyrics, the fruit of sectarian fervour, a large collection of hymns and detached stanzas, extolling some special deity, might be made from Purāṇas and other works. Of independent productions of this kind only a few of the more important can be mentioned here. Sankarāchārya, the great Vedāntist, who probably lived in the 7th century, is credited with several devotional poems, especially the *Ananda-laharī*, or "wave of joy," a hymn of 103 stanzas, in praise of the goddess Pārvatī. The *Sūrya-sāhita*, or century of stanzas in praise of Sūrya, the sun, is ascribed to Mayūra, the contemporary (and, according to a tradition, the father-in-law) of Bāna (in the early part of the 7th century). The latter poet himself composed the *Chandīśāstava*, a hymn of 102 stanzas, extolling Śiva's consort. The *Khandapastava*, a poem celebrating the ten avatāras of Vishnu, is ascribed to no other than Hanumān, the monkey general, himself Jayadeva's beautiful poem *Gītāgovinda*, which, like most productions concerning Kṛṣṇa, is of a very sensuous character, has already been referred to.

Didactic
poetry

The particular branch of didactic poetry in which India is especially rich is that of moral maxims, expressed in single stanzas or couplets, and forming the chief vehicle of the *Nīti-śāstra* or ethic science. Excellent collections of such aphorisms have been published,—in Sanskrit and German by Dr v. Böhtlingk, and in English by Dr J. Muir. Probably the oldest original collection of this kind is that ascribed to Chāṇakya,—and entitled *Rājyāntara-mukhaśāstra*, "collection on the conduct of kings"—traditionally connected with the Machiavellian minister of Chandragupta, but (in its present form) doubtless much later—of which there are several recensions, especially a shorter one of one hundred couplets, and a larger one of some three hundred. Another old collection is the *Kāmandakya-Nītiśāstra*,² ascribed to Kāmandakī, who is said to have been the disciple of Chāṇakya. Under the name of Bhartṛhari have been handed down three centuries of sententious couplets, one of which, the *nīti-sāhita*, relates to ethics, whilst the other two, the *śṛṅgāra*- and *varāḍya-sāhitas*, consist of amatory and devotional verses respectively. The *Nīti-pradīpa*, or "lamp of conduct," consisting of sixteen stanzas, is ascribed to Veṭālabhata, who is mentioned as one of nine gems at Vikramāditya's court (c. 550 A.D.). The *Amara-sāhita*, consisting of a hundred stanzas, ascribed to a King Amara (sometimes wrongly to Saṅkara), and the *Chaura-sūratapanchāśikā*, by Būhana (11th century), are of an entirely erotic character.

Fables
and
narratives

6 *Fables and Narratives*.—For purposes of popular instruction stanzas of an ethical import were early worked up with existing prose fables and popular stories, probably in imitation of the Buddhist *jātakas*, or birth-stories. A collection of this kind, intended as a manual for the guidance of princes (*in usum delphini*), was translated into Pahlavi in the reign of the Persian king Chosro Nushirvan, 531-579 A.D.; but neither this translation nor the original is any longer extant. A Syriac translation, however, made from the Pahlavi in the same century, under the title of "Quahlag and Dimnag"—from the

Sanskrit "Kāṇṭaka and Damanaka," two jackals who play an important part as the lion's counsellors—has been discovered and published. The Sanskrit original, which probably consisted of fourteen chapters, was afterwards recast,—the result being the existing *Panchatant*,³ or "five books" (or headings). A popular summary of this work, in four books, the *Hitopadeśa*,⁴ or "Salutary counsel," is ascribed to the Brāhmaṇa Vishnuśarma. Other highly popular collections of stories and fairy tales, interspersed with moral maxims, are—the *Vedā-paṇchamśat* or "twenty-five (stories) of the Veṭilā" (the original of the Bāṭāl Pāchist), ascribed either to Jambhala Datta, or to Śivādāsa (while Prof. Weber suggests that Veṭilā-bhata may have been the author), and at all events older than the 12th century, since Somadeva has used it; the *Sūta-septatī*, or "seventy (stories related) by the parrot," the author and age of which are unknown, and the *Simhāsana-dedīrṃśikā*, or "thirty-two (tales) of the throne," being laudatory stories regarding Vikramāditya, related by thirty-two statues, standing round the old throne of that famous monarch, to King Bhoga of Dhīrā to discourage him from sitting down on it. This work is ascribed to Kṣhemamānaka, and was probably composed in the time of Bhoga (who died in 1053) from older stories in the Mahārāṣṭra dialect. The original text has, however, undergone many modifications, and is now known in several different recensions. Of about the same date are two great storehouses of fairy tales, composed entirely in śloka, viz., the *Vṛhat-kathā*, or "great story," by Kṣhemendra, also called Kṣhemamānaka, who wrote c. 1020-40, under King Ananta, and the *Kathā-sarit-sāgara*,⁵ or "the ocean of the streams of story," composed by Somadeva, in the beginning of the 12th century, to console the mother of King Harshadeva on her son's death. Both these works are based on a work in the Pālisht dialect, of the 6th century, viz., Guṇādhyāya's *Vṛhat-kathā*.

In higher class prose works of fiction the Sanskrit literature is extremely poor, and the few productions of this kind of which it can boast are of a highly artificial and pedantic character. These include the *Dadāumdra-chavita*,⁶ or "the adventures of the ten princes," composed by Dandin, about the 6th century, and the *Vāsanadattā*,⁷ by Subandhu, the contemporary of the poet Bāna (c. 620), who himself wrote the first part of a novel, the *Kūdambarī*,⁸ afterwards completed by his son.

B. SCIENTIFIC LITERATURE

I. *LAW (Dharma)*.—Among the technical treatises of the later Law. Vedic period, certain portions of the Kāpa-śāstra, or manuals of ceremonial, peculiar to particular schools, were referred to as the earliest attempts at a systematic treatment of law subjects. These are the *Dharma-śāstras*, or "rules of (religious) law," also called *Sāmāyachārika-śāstras*, or "rules of conventional usage (samāyachāra)." It is doubtful whether such treatises were at any time quite as numerous as the Gṛhyasūtras, or rules of domestic or family rites, to which they are closely allied, and of which indeed they may originally have been an outgrowth. That the number of those actually extant is comparatively small is, however, chiefly due to the fact that this class of works was supplanted by another of a more popular kind, which covered the same ground. The Dharmaśāstras consist chiefly of strings of terse rules, containing the essentials of the science, and intended to be committed to memory, and to be expounded orally by the teacher—thus forming, as it were, epitomes of class lectures. These rules are interspersed with couplets or "gāthās," in various metres, either composed by the author himself, or quoted from elsewhere, which generally give the substance of the preceding rules. One can well understand why such couplets should gradually have become more popular, and

⁸ Edited by Madana Mohana Sarman, and by P. Peterson.

should ultimately have led to the appearance of works entirely composed in verse. Such metrical law-books did spring up in large numbers, not all at once, but over a long period of time, extending probably from about the beginning of our era, or even earlier, down to well-nigh the Mohammedan conquest, and, as at the time of their first appearance the epic impulse was particularly strong, other metres were entirely discarded for the epic śloka. These works are the metrical *Dharmasūtras*, or, as they are usually called, the *Smṛitis*, "recollection, tradition,"—a term which, as we have seen, belonged to the whole body of *Sūtras* (as opposed to the *Śāstra*, or revelation), but which has become the almost exclusive title of the versified institutes of law (and the few *Dharmasūtras* still extant). Of metrical *Smṛitis* about forty are hitherto known to exist, but their total number probably amounted to at least double that figure, though some of these, if it is true, are but short and insignificant tracts, while others are only different recensions of one and the same work.

With the exception of a few of these works—such as the *Agnya*, *Yama*, and *Pishnu-Smṛitis*—which are ascribed to the respective gods, the authorship of the *Smṛitis* is attributed to old sages, such as Ati, Kāṇva, Vyasa, Śāṇḍilya, Bhṛāgu, &c. It is, however, extremely doubtful whether in most cases this attribution is not altogether fanciful, or whether, as a rule, there really existed a traditional connexion between these works and their alleged authors or schools named after them. The idea, which early suggested itself to Sanskrit scholars, that *Smṛitis* which passed by the names of old Vedic teachers and their schools might simply be metrical recensions of the *Dharma*- (or *Grihya*)-*sūtras* of these schools, is a very natural one, and indeed is still a very probable one, though the loss of the original *Sūtras*, and the modifications and additions which the *Smṛitis* doubtless underwent in course of time, make it very difficult to prove this point. One could, however, scarcely account for the disappearance of the *Dharmasūtras* of some of the most important schools except on the ground that they were given up in favour of other works, and as it is likely that this should have been done, unless there was some guarantee that the new works, upon the whole, embodied the doctrines of the old authorities of the respective schools? Thus, as regards the most important of the *Smṛitis*, the *Mānava-Dharmasūtra*, there exist both a *Śrauta*- and a *Grihya*-*sūtra* of the *Mānava* school of the Black Yajus, but no such *Dharmasūtra* has hitherto been discovered, though the former existence of such a work has been made all but certain by Prof. Bühler's discovery of quotations from a *Mānavam*, consisting partly of *śrauta* and partly of *grihya* ceremonies, some of which occur literally in the *Manusmṛiti*, whilst others have been slightly altered there to suit later doctrines, and have been changed from the original *śruti* into the epic metre. The idea of an old law-giver *Manu* *śrīvāyambhuva*, "sprung from the self-existent (*svayam-bhūt*)" god *Brahman*,—reaches far back into Vedic antiquity (he is mentioned as such in early texts, and in Yaska's *Nirukta* a śloka occurring giving him opinion on a point of inheritance. But whether or not the *Mānava-Dharmasūtra* embodied what was supposed to be the authoritative precepts of this sage on questions of sacred law we do not know, nor can it as yet be shown that the *Manusmṛiti*, which seems itself to have undergone considerable modifications, is the lineal descendant of that *Dharmasūtra*. It is, however, worthy of note that a very close connexion exists between the *Manusmṛiti* and the *Vishnuśmṛiti*, and, as the latter is most likely a modern, only partially compiled, edition of the *Śāntis* of the Black *Yajus*, the close relation between the two works would be easily understood, if it could be shown that the *Manusmṛiti* is a modern development of the *Sūtras* of another school of the Charaka division of the Black Yajurveda.

The *Mānava Dharmasūtra* consists of twelve books, the first and last of which, treating of creation, transmigration, and final beatitude, are, however, not regarded as later additions. In them the legendary sage Bhṛāgu, here called a *Mānava*, is introduced as *Manu*'s disciple, though whom the great teacher has his work promulgated. Why this intermediate agent should have been considered necessary is by no means clear. Except in these two books the work shows no special relation to *Manu*, for, though he is occasionally referred to in it, the same is done in other *Smṛitis*. The question as to the probable date of the final redaction of the work cannot as yet be answered. Dr. Burnell has tried to show that it was probably composed under the Chāḷukya king Pulakēśi, about 500 A.D., but his argumentation is anything but convincing. From several ślokas quoted from *Manu* by Varāhamihira, in the 6th century, it would appear that the text which the great astronomer had before him differed very considerably from our *Manusmṛiti*. It is, however, possible that he referred either to the *Bṛhat-Manu* (Great *Manu*) or the *Vṛddha-*

Manu (Old *Manu*), who are often found quoted, and apparently represent one, if not two, larger recensions of the *Smṛiti*. The oldest existing commentary on the *Mānava-Dharmasūtra* is by Meidhātithi, who is first quoted in 1200, and is usually supposed to have lived in the 9th or 10th century. He had, however, several predecessors to whom he refers as *pūrvā*, "the former ones."

Next in importance among *Smṛitis* ranks the *Yājñavalkya Yājñava-Dharmasūtra*;¹ its origin and date are not less uncertain,—except valkya that, in the opinion of Prof. Stenzler, which has never been questioned, it is based on the *Manusmṛiti*, and represents a more advanced stage of legal theory and definition than that work. *Yājñavalkya*, as we have seen, is looked upon as the founder of the *Vijayāsana* or White Yajus, and the author of the *Śatapatha-brahmana*. In the latter work he is represented as having passed some time at the court of King Janaka of Videha (Trinakt), and in accordance therewith it is stated, in the introductory complete of the *Dharmasūtra*, to have propounded his legal doctrines to the sages, while staying at Mithilā (the capital of Videha). Hence, if the connexion between the metrical *Smṛitis* and the old Vedic schools are at all correct, not one of name merely, we should expect to find in the *Yājñavalkya-smṛiti* special coincidences of doctrine with the *Kāṭyāyana*, the principal *Sūtra* of the *Vijayāsana*. Now, some interesting striking coincidences between this *Smṛiti* and *Parāśara's Kāṭyāyana-Grihyaśāstra* have indeed been pointed out, and if there ever existed a *Dharmasūtra* belonging to the same school, of which no trace has hitherto been found, the points of agreement between this and the *Dharmasūtra* might be expected to be even more numerous than as in the case of *Manu*. *Ślokas* are quoted in various works from a *Bṛhat*- and a *Vṛddha-Yājñavalkya*. The *Yājñavalkya-smṛiti* consists of three books, corresponding to the three great divisions of the Indian theory of law—*dharma*, rule of conduct (social and caste duties), *vyavahāra*, civil and criminal law, and *pratyakṣa*, penance or expiation. There are two important commentaries on the work—the famous *Mātṛkā*,² by Vyādhyaśvara, who lived under the Chāḷukya king Vikramāditya of Kanchi (1012-1127), and another by Aparāṇḍi on Apāṇḍitya, a petty Śāṭva prince of the latter half of the 12th century.

The *Parāśara-smṛiti* contains no chapter on jurisprudence, but *Parāśara* treats only of religious duties and expiations in 12 *adhyaṃyas*. The deficiency was, however, supplied by the famous exegete Mātṛhava (in the latter half of the 14th century), who made use of *Parāśara's* text for the compilation of a large digest of religious law, now called *Parāśara-a-mātṛhava*, to which we have already referred in our *vyavahāra*,³ a law paper. Besides the ordinary text of the *Parāśara-smṛiti*, consisting of rather less than 600 couplets, there is also extant a *Bṛhat-Parāśara-smṛiti*, probably an amplification of the former containing not less than 2980 (according to others even 3800) ślokas. The *Nārada-Dharmasūtra*, or *Nārada-smṛiti*, is a work of a more practical kind, indeed, it is probably the most systematic and business-like of all the *Smṛitis*. It does not concern itself with religious and moral precepts, but is strictly confined to law. Of this work again there are at least two different recensions. Besides the text translated by Dr. Jolly, a portion of a larger recension has come to light in India. This version has been commented upon by Asahya, "the peacock"—a very esteemed writer on law who is supposed to have lived before Meidhātithi (9th century), and it may therefore be considered as the older recension of the two. But, as it has been found to contain the word *dharma*, an adaptation of the Roman *dominus*, it cannot, at any rate, be older than the 2d century, indeed, its date is probably several centuries later.

Whether any of the *Dharmasūtras* were ever used in India as actual "codes of law" for the practical administration of justice is very doubtful, indeed, so far as the most prominent works of this class are concerned, it is highly improbable. No doubt these works were held to be of the highest authority as laying down the principles of religious and civil duty, but it was not so much any single text as the whole body of the *Smṛiti* that was looked upon as the embodiment of the divine law. Hence, the moment the actual work of codification begins in the 11th century, we find the jurists engaged in practically showing how the *Smṛitis* confirm and supplement each other, and in reconciling seeming contradictions between them. This new phase of Indian jurisprudence commences with Vyādhyaśvara's *Mātṛkā*, which, though primarily a commentary on *Yājñavalkya*, is so rich in original matter and illustrations from other *Smṛitis* that it is far more adapted to serve as a code of law than the work it professes to explain. This treatise is held in high esteem all over India, with the exception of the Bengal or Gaudya school of law, which recognizes as its chief authority the digest of its founder, Jīmitavāna, especially the chapter on succession, entitled *Jīmitavāna*.

¹ The standard edition is by G. C. Haughton, with Sir W. Jones's translation, 1829, the latest translations by A. Burnell and G. Bühler. There is also a critical essay on the work by F. Jolaniot. On the relation between the *Dharmasūtras* and *Smṛitis* see especially Van Buitendijk, *Digest of Hindu Law*, 2d ed., p. 27.

² Edited, with German transl., by F. Stenzler.

⁴ This section of this chapter on inheritance (*dharma-vibhāga*) has been translated by A. C. Burnell, 1868.

⁵ See Van Buitendijk, *Digest*, p. 155. A different view is expressed by A. Burnell, *Yājñavalkya*, p. xiii.

⁶ Transl. by H. C. Colebrooke, 1810.

Based on the *Mātākāśhā* are the *Sūtri-Jālandhī*,¹ a work of great common-sense, written by Devānā Bhaṭṭa, in the 13th century, and highly esteemed in Southern India, and the *Vīramūlādya*, a compilation consisting of two chapters, on *śāśā* and *vyavāhāra*, made in the first half of the 17th century by Mitrāmra, or Rājā Vinuṃha, or Bīrānā Dēo of Orissā, who murdered Abul Faiz, the minister of the emperor Akbar, and author of the *Am̐ Alabā*. There is no need here to enumerate any more of the vast number of treatises on special points of law, of greater or less merit, the more important of which will be found mentioned in English digests of Hindu law.

II. *PHILOSOPHY*.—The Indian mind shows at all times a strong disposition for metaphysical speculation. In the old religious lyrics this may be detected from the very first. Not to speak of the abstract nature of some even of the oldest Vedic deities, this propensity betrays itself in a certain mystic symbolism, tending to refine and spiritualize the original purely physical character and activity of some of the more prominent gods, and to impart a deep and subtle import to the rites of the sacrifice. The primitive worship of more or less isolated elementary forces and phenomena had evidently ceased to satisfy the religious wants of the more thoughtful minds. Various syncretist tendencies show the drift of religious thought to be towards some kind of unity of the divine powers, be it in the direction of the pantheistic idea, or in that of an organism, or even towards monothism. In the latter age of the hymns the pantheistic idea is rapidly gaining ground, and finds vent in various cosmogonic speculations, and in the Bīhāmanas period we see it fully developed. The fundamental conception of this doctrine finds its expression in the two synonymous terms *brahman* (neut.), originally "power of growth," then "devotional impulse, prayer," and *ātman* (masc.), "beatitude, self, soul."

The recognition of the essential sameness of the individual souls, emanating all alike (whether really or imaginarily) from the ultimate spiritual essence (*apa-brahman*) "as sparks issue from the fire," and destined to return thither, involved some important problems. Considering the infinite diversity of individual souls of the animal and vegetable world, exhibiting various degrees of perfection, it is not surprising that each of them is the immediate efflux of the Supreme Being, the All-perfect, and that each, from the lowest to the highest, could re-unite therewith directly at the close of its mundane existence.² The difficulty implied in the latter question was at first met by the assumption of an intermediate state of expiation and purification, a kind of purgatory, but the whole problem found at last a more comprehensive solution in the doctrine of *reincarnation*, or *saṃsāra*. Some scholars have suggested that metaphysics may have been the prevalent belief among the aboriginal tribes of India, and may have been taken over from them by the Indo-Aryans. This no doubt is quite possible, but even in that case we can only assume that speculative minds seized upon it as offering the most satisfactory (if not the only possible) explanation of the great problem of phenomenal existence. It is certainly a significant fact that, once established in Indian thought, the doctrine of *metempsychosis* is never again called in question,—that, like the fundamental idea on which it rests, viz., the essential sameness of the immaterial element of all sentient beings, the notion of *saṃsāra* has become an axiom, a universally conceded principle of Indian philosophy. Thus the latter has never quite risen to the heights of pure thought, its object is undeniably, the search for knowledge, but it is an inquiry (*mīmāṃsā*) into the nature of things undertaken not solely for the attainment of the truth, but with a view to a specific object,—the discontinuance of *saṃsāra*, the cessation of mundane existence after the present life. Every sentient being, through ignorance, being liable to sin, and destined after each existence to be born again in some new form, dependent on the actions committed during the immediately preceding life, all mundane existence thus is the source of ever-renewed suffering, and the task of the philosopher is to discover the means of attaining *mokṣha*, "release" from the bondage of material existence, and *yoga*, "union" with the Supreme Self,—in fact, salvation. It is with a view to this, and this only, that the Indian metaphysician takes up the great problems of life,—the origin of man and the universe, and the relation of the individual soul to the gods and the Devas. Nevertheless, the fact that these were only higher grades from which the individual self would still be liable to relapse into the vortex of material existence,—that the final goal

lay beyond even those worlds, unattainable through aught but a perfect knowledge of the soul's nature and its identity with the Supreme Self,—this fact of itself was sufficient to deprecate the merit of the sacrificial cult, and to undermine the authority of the sacred texts. "Know ye that Self," exhorts one of those old idealists,³ "and have done with other work, for such (dualistic) is the budge to immortality." Intense self-contemplation, being, moreover, the only way of attaining the all-important knowledge, this doctrine left little or no room for those mediatorial offices of the priest, so indispensable in ceremonial worship, and indeed we actually read of Bīhāman sages resorting to Kāśyapa princes to hear them expound this, the true doctrine of salvation. But, in spite of their anti-hierarchical tendency, these speculations continued to gain ground, and in the end the body of treatises propounding the pantheistic doctrine, the Upanishads, were admitted into the sacred canon, as appendages to the ceremonial writings, the Bīhāmanas. The Upanishads thus form literally "the end of the Veda," the *Vedānta*, but their adherents claim this title for them doctrines in a metaphorical rather than in a material sense, as "the ultimate aim and consummation of the Veda." In later times the radical distinction between these speculative appendages and the bulk of the Vedic writings was strongly accentuated in a new classification of the sacred scriptures. According to this scheme they were supposed to consist of two great divisions, the *Śākhya-kāṇḍa*, i. e., "the work-section," or practical ceremonial (external) part, consisting of the *Samhitās* and Bīhāmanas (including the ritual portions of the *Śākhās*), and the *Vidya-kāṇḍa*, "the knowledge-section," or speculative (esoteric) part. These two divisions are also called respectively the *Pāra-* ("former") and *Uttara-* ("latter," or higher) *kāṇḍa*, and when the speculative tenets of the Upanishads came to be formulated into a regular system it was deemed desirable that there should also be a special system corresponding to the older and larger portion of the Vedic writings. Thus arose the two systems,—the *śāstra* (or *Karma-*) *mīmāṃsā*, or "former (practical) speculation," and the *Uttara-* (or *Brahma-*) *mīmāṃsā*, usually called the *Vedānta* philosophy.

It is not yet possible to determine, even approximately, the Philo-time when the so-called *Dāśanā*s (literally "demonstrations"), or school systems of philosophy, were first set on foot, though system. They have certainly developed from the tenets enunciated in the Upanishads, there is considerable doubt as to the exact order in which these systems succeeded each other. The authoritative *exposés* of the systems have apparently passed through several redactions, and, in their present form, these *śāstra*-works⁴ evidently belong to a comparatively recent period, being probably not older than the early centuries of our era. The oldest general review of the philosophical systems (except the Vedānta) is contained by a native scholar in the *Sarva-dāśanā-saṅgraha* ("summary of all the Dāśanā's"), composed in the 14th century, from a Vedāntist point of view, by the great exaragat Mādhava Acharya.

Among the different systems, six are generally recognized as orthodox, as being (either wholly or for the most part) consistent with the Vedic religion,—two and two of which are again more closely related to each other than to the rest, viz.

- (1) *Pāra-mīmāṃsā* (*Ālīmāṃsā*), and (2) *Uttara-mīmāṃsā* (*Vedānta*)
- (3) *Sāṅkhya*, and (4) *Yoga*,
- (5) *Nyāya*, and (6) *Vaiśeṣika*.

(1) The (*Pāra-*) *Mīmāṃsā* is not a system of philosophy in the Mi-proper sense of the word, but rather a system of dogmatic criticism *māṃsā*, and scriptural interpretation. It maintains the eternal existence of the Veda, the different parts of which are minutely classified. Its principal object, however, is to ascertain the religious (chiefly ceremonial) duties enjoined in the Veda, and to show how these duties must be performed, and what are the special merits and rewards attached to them. Hence arises the necessity of determining the principles for rightly interpreting the Vedic texts, and of what forms its only claim to being classed among speculative systems, viz., a philosophical examination of the means of, and the proper method for arriving at, accurate knowledge. The foundation of this school, as well as the composition of the *Sūtras* or aphorisms which constitute its chief doctrinal authority, is ascribed to Jaimini. The *Sūtras* were commented on by Sabara Svāmī, and further annotations (*vārtikas*) thereon were supplied by the great theologian Kumāla Bhaṭṭa, who is supposed to have lived in the (8th or) 7th century, and to have worked hard for the re-establishment of Bīhāmanism. According to a popular tradition his self-immolation was witnessed by Śaṅkarāchārya. The most

¹ *Mundaka-upanishad*, i. 2, 6.

² Cf. *Mundaka-upanishad*, i. 4, 8, where these two divisions are called "the lower (*aparā*) and the higher (*parā*) knowledge."

³ These works have all been printed with commentaries in India, and they have been partly translated by J. Ballantyne, and by M. Bhaṭṭaraya. The best general view of the systems is to be obtained from C. C. Colebrooke's *Essay on the *Śāstra**, i. 2d ed., with Prof. Cowell's notes. Compare also the brief abstract given in Goldstucker's *Literary Remains*, vol. i. A very useful classified index of philosophical works was published by P. Ball, 1829.

⁴ Edited in the *Bibliotheca Indica*, translated by E. B. Cowell and A. E. Gough, 1882.

¹ The section on *reincarnation* has been translated by T. Kristjánsson, Iyer, 1896.

² See, e.g., A. E. Gough, *The Philosophy of the Upanishads*, p. 24.

approved general introduction to the study of the Mīmāṃsā is the metrical *Śaṅkha-yajña-mūla-śāstra*,¹ with a prose commentary, both by Mūlharā Acharya. This distinguished writer, who has already been mentioned several times, was formerly supposed, from frequent statements in MSS., to have been the brother of Śiṣya, the well-known interpreter of the Vedas. The late Dr. Burnell² has, however, made it very probable that these two are one and the same person, Śiṣya being his Telugu, and Mūlharācharya his Bihmānāli name. In 1831 he became the *yogacharya*, or spiritual head, of the Smārta (a Vedāntist sect under Śaṅkhaśāstrī) at the Math of Sringeri, where, under the patronage of Bakka, king of Vidyanagara, he composed his numerous works. He sometimes passes under a third name, Vidyanaya-vishnu, adopted by him on becoming a *sannyāsin*, or religious mendicant.

Valāta. (2) The *Vedānta* philosophy, in the comparatively primitive form in which it presents itself in most of the Upanishads, constitutes the earliest phase of systematic metaphysical speculation. In its essential features it remains to this day the prevalent belief of Indian thinkers, and enters largely into the religious life and convictions of the people. It is an idealistic monism, which denies the universe from an ultimate conscious spiritual principle, the one and only existent from eternity—the *Ātman*, the Self, or the *Purusha*, the Person, the *Brahman*. It is this primordial essence or Self that pervades all things, and gives life and light to them, without being sullied by the visible outward impurities or the miseries of the world, being itself apart,³—and into which all things fall, through knowledge, ultimately resolve themselves. "The man who perceives him as being within their own Self, to them belongs eternal peace, not to others."⁴ But, while the commentators never hesitate to interpret the Upanishads as being in perfect agreement with the Vedāntic system, as elaborated in later times, there is often considerable difficulty in accepting their explanations. In these treatises only the leading features of the pantheistic theory find utterance, generally in vague and mystic though often in singularly powerful and poetical language, from which it is not always possible to extract the author's real ideas on fundamental points, such as the relation between the Supreme Spirit and the phenomenal world,—whether the latter was actually evolved from the former by a power inherent in him, or whether the process is altogether a fiction, an illusion of the individual self. Thus the *Kātha-Upanishad*⁵ offers the following summary:— "Beyond the senses [there are the objects, beyond the objects] there is the mind, and beyond the mind there is the intellect, and beyond [Buddhi], beyond the intellect there is the Great Self. Beyond the Great One there is the Highest Undeveloped (avyaktam); beyond the Undeveloped there is the Person (puruṣa), the all-pervading, characterless (alinga). Whatsoever knows him is liberated, and attains immortality." Here the Vedāntist commentator assumes us that the Great Undeveloped, which the Śāṅkhya would claim as their own primary material principle (*pradhāna*, *prakṛti*), is in reality *Mūla*, illusion (otherwise called *Avyākṛt*, ignorance, or *Sakti*, power), the fictitious energy which in conjunction with the Highest Self (Ātman, Purusha) produces or constitutes the *Īvara*, the Lord, or Cosmic Soul, the first emanation of the Ātman, and himself the (fictitious) cause of all that seems to exist. It must remain doubtful, however, whether the author of the Upanishad really meant this, or whether he regarded the Great Undeveloped as an actual material principle, as an extension of matter from out of the Purusha, though not, as the Śāṅkhya hold, coexisting with him from eternity. Besides passages such as these which seem to indicate realistic or materialistic tendencies of thought, which may well have developed into the dualistic Śāṅkhya and kindred systems, there are others which indicate the existence even of nihilist theories, such as the Bauddhas—the *Māyā-śāstra*, or affirmers of a void or primordial nothingness.— "Thus we read in the *Ghāṇḍyā-Upanishad*⁶ :—"The existent alone, my son, was here in the beginning, one only, without a second. Others say, that was the non-existent alone here in the beginning, one only, without a second,—and from the non-existent the existent was born. But how could this be, my son? How could the existent be born from the non-existent? No, my son, only the existent was here in the beginning, one only, without a second."

The foundation of the Vedānta system, as "the completion of the Veda," is naturally ascribed to Vyāsa, the mythic arranger of the Vedas, who is said to be identical with Balarāyaṇa, the reputed author of the *Brahma*- (or *Sātrāra*)-*sātra*, the authoritative, though highly obscure, summary of the system. The most distinguished interpreter of these aphorisms is the famous Malabar

Śaṅkara.

with teachers—whether of the Śāiva, or Vaiṣṇava, or less orthodox persuasions—with the view of rooting out heresy and re-establishing the doctrine of the Upanishads. His controversial triumphs (doubtless largely mythical) are related in a number of treatises current in South India, the two most important of which are the *Śaṅkara-śāstrīya* ("Śaṅkara's world-conquest, ascribed to his own disciple Āṇandagiri, and the *Śaṅkara-nyāya*, by Mūlharācharya. In Śaṅkara's philosophy⁷ the theory that the material world has no real existence, but is a mere illusion of the individual soul wiped in ignorance,—that, therefore, it has only a practical or conventional (*vyavahārika*) but not a transcendental or true (*parā* and *tāka*) reality,—is strictly enforced. To the question why the Supreme Self (or rather his fictitious department, the Highest Lord, or cosmic soul) should have sent forth this phantasmagory thus great thanks (with the author of the *Sāstras*?) can return no better answer than that it must have been done for sport (*līla*), without any special motive—since to ascribe such a motive to the Supreme Lord would be limiting his self-sufficiency,—and that the process of creation has been going on from all eternity. Śaṅkara's *Sātrāra-nimāna-śāstrīya* has given rise to a large number of evasive treatises, of which Vachaspathi-mīmāṃsā's *Śaṅkara Bhāṣanā*⁸ is the most extreme. Of numerous other commentaries on the *Brahma-sūtras*, the *Śrī-śāstrīya*, by Rāmānuja, the founder Rāmā. of the Śrī-Vaiṣṇava sect, is the most noteworthy. This religious nyāya teacher, who probably flourished during the first half of the 12th century, caused a schism in the Vedānta school. Instead of adhering to Śaṅkara's or *āśāstra*, or non-duality doctrine, he put forth the theory of *viśiṣṭādvaita*, or distinction of principle, but not of distinct principle, or, as it is more commonly explained, non-duality of that which is qualified (by attributes). According to this theory the Brahman (which is identical with Vishnu) is neither devoid of form and quality, nor is it all things, but it is endowed with all good qualities, and matter is distinct from it, both consist of souls (*chēt*) and matter (*achēt*), and God is the soul. With this theory is combined the ordinary Vaiṣṇava doctrine of periodical descents (*avatāra*) of the deity in various forms, for the benefit of creatures. In Rāmānuja's system considerable play is also allowed to the doctrine of faith (*bhakti*).⁹ This phase of Indian religious belief, which has attached itself to the Vedānta theory more closely than to any other, and the origin of which some scholars are inclined to attribute to Christian influence, seems first to make its appearance very prominently in the *Chopradāya*, the epics of the *Mahābhārata*, and especially referred to, and even more fully developed in the Purāṇas, and especially the Bhāgavata. In the *Śaṅkhya* (*Bhakti*)-*sātra*,¹⁰ the author and date of which are unknown, the doctrine is systematically propounded in one hundred aphorisms. According to this doctrine mundane existence is due to want of faith, not to ignorance, and the final liberation of the individual soul can only be effected by faith. Knowledge only contributes to this end by removing the minds' failings, unbelief. Its highest aim is development of the doctrine probably reached in the religious creed of the *Bhaktas*, a Vaiṣṇava sect founded, towards the end of the 15th century, by Chaitanya, whose followers subsequently grafted the Vedānta speculations on his doctrine. A popular summary of the Vedānta doctrine is the *Vedānta-sātra* by Śaṅkara, which has been frequently printed and translated.¹¹

(3) The *Śaṅkhya*,¹² or "enumerative" system, probably derives Śāṅkhya. its name from its systematic enumeration of the twenty-five principles (*tattva*) it recognizes—consisting of twenty-four material and an independent immaterial principle. In opposition to the Vedānta school, which maintains the eternal coexistence of a spiritual principle of reality and an unspiritual principle of unreality, the Śāṅkhya assumes the eternal coexistence of a material first cause, which it calls either *mūla*-*Pradhāna* (fem.), "Chief Organism" (Nature), or *Pradhāna*, "the principal cause, and the materiality of spiritual elements or *Selves*, *Puruṣas*." The system recognizes no intelligent creator (such as the *Īvara*, or demigods, of the Vedānta)—whence it is called *avikāra*, godless, but it conceives the Material First Cause, itself unintelligent, to have become developed, by a gradual process of evolution, into all the actual forms of the phenomenal universe, excepting the souls. Its first emanation is *buddhi*, intelligence, whence springs *cheṭanā*, consciousness, thence five elementary particles (*tanmātra*) and eleven organs of senses, and finally, from the elementary particles, five elements. The souls have from all eternity been connected with Nature,—having in the first place become invested with a subtle frame (*linga*-, or *sūkṣma*-, *śarīra*), consisting of seventeen principles, viz., intelligence, consciousness, elementary particles, and organs of sense and action, including

GRAM- III. GRAMMAR (*Vyākaraṇa*)—We found this subject enumerated as one of the six "limbs of the Vedā," or auxiliary sciences, the study of which was deemed necessary for a correct interpretation of the sacred Mantras, and the proper performance of Vedic rites. Linguistic inquiry, phonetic as well as grammatical, was indeed early resorted to both for the purpose of elucidating the meaning of the Veda, and with the view of settling its textual form. The particular work which came ultimately to be looked upon as the "vedāṅga" representative of grammatical science, and has ever since remained the standard authority for Sanskrit grammar in India, is Pāṇini's *Aṣṭādhyāyī*,¹ so called from its

Pāṇini "consisting of eight lectures (*adhyaṅga*)," of four *pādas* each. For a comprehensive grasp of linguistic facts, and a penetrating insight into the structure of the vernacular language, this work stands probably unrivalled in the literature of any nation, though few other languages, it is true, afford such facilities as the Sanskrit for a scientific analysis. Pāṇini's system of arrangement differs entirely from that usually adopted in our grammars, viz., according to the so-called parts of speech. As the work is composed in aphorisms intended to be learnt by heart, economy of memory-matter was the author's paramount consideration. The object was chiefly attained by the grouping together of all cases exhibiting the same phonetic or formative feature, no matter whether or not they belonged to the same part of speech. For this purpose he also makes use of a highly artificial and ingenious system of algebraic symbols, consisting of technical letters (*anubandha*), used chiefly with suffixes, and indicative of the changes which the roots or stems have to undergo in word-formation.

It is self-evident that so complicated and complete a system of linguistic analysis could not have been sprung up all at once and in the infancy of grammatical science, but that many generations of scholars must have laboured to bring it to that degree of perfection which it exhibits in Pāṇini's work. Accordingly we find Pāṇini himself making reference in various places to ten different grammarians, besides two schools, which he calls the "eastern (*prācīna*)" and "northern (*uttarīya*)" grammarians. Perhaps the most important of his predecessors was Śākātyāna,² also mentioned by Yāska—as the Mṛutika, who is likewise supposed to have preceded Pāṇini—as the only grammarian (*vaidyākaraṇa*) who held with the etymologists (*naiṣṭika*) that all nouns are derived from verbal roots. Unfortunately there is little hope of the recovery of his grammar, which would probably have enabled us to determine somewhat more exactly to what extent Pāṇini was indebted to the labours of his predecessors. The earliest grammarian mentioned in South Indian MSS. entitled *Śākhāśāstra*, which is ascribed to one Śākātyāna,³ but this has been proved⁴ to be the production of a modern Jain writer, which, however, seems to be partly based on the original work, and partly on Pāṇini and others. Pāṇini is also called Dākṣaputra, after his mother Dākṣi. As his birthplace the village Śālūtana is mentioned, which was situated some few miles north-west of the Indus, in the country of the Gaṇdhāra, whence later writers also call him Śālūtīya. The formation of this name he himself explains in his grammar. Another name sometimes applied to him is Śālanika. In the *Kaṭhāśāstradīpa*, a modern collection of popular tales mentioned above, Pāṇini is said to have been the pupil of Vāśila, a teacher at Pātālīputra, under the reign of Nanda, the father (?) of Chandragupta (315-291 B.C.). The real date of the great grammarian is, however, still a matter of uncertainty. It is usually designated as 295 B.C. But, as it is by no means certain⁵ that this term really applies to the Greek alphabet, it is scarcely expedient to make the word the corner-stone of the argument regarding Pāṇini's age. If Pātālīputra's "great commentary" was written, as seems highly probable, about the middle of the 2nd century B.C., it is hardly possible to assign to Pāṇini a later date than about 400 B.C. Though this grammarian registers numerous words and formations as peculiar to the Vedic hymns, his chief concern is with the ordinary speech (*śākhā*) of his period and its literature, and it is noteworthy, in this respect, that the rules he lays down on some important points of syntax (as pointed out by Profs Bhandarkar and Kielhorn) are in accord with the practice of the Bīhārīans rather than with that of the later classical literature.

Pāṇini's Sūtras continued for ages after to form the centre of grammatical activity. But, as his own work had superseded those of his predecessors, so many of the scholars who devoted themselves to the task of perfecting his system have sunk into oblivion. The earliest of his successors whose work has come down to us (though perhaps not in a separate form), is Kātyāyana, Kātyāyana, the author of a large collection of some critical notes, called *yama Vārtika*, intended to supplement and correct the Sūtras, or give them greater precision. The exact date of this writer is likewise unknown, but there can be little doubt that he lived at least a century after Pāṇini. During the interval a new body of literature seems to have sprung up—accompanied with considerable changes of language—and the geographical knowledge of India as rendered over large tracts towards the south. Whether this is the same Kātyāyana to whom the Vāṣṇepi-śrī-pāṭikāṭya (as well as the Sarvāṅkama) is attributed, is still doubted by some scholars.⁶ Kātyāyana being properly a family or tribal name, meaning "the descendant of Kātya," later works usually assign a second name. Vararuchi to the writers (for there are at least two) who bear it. The Kaṭhāśāstradīpa makes the author of the Vārtika a late-student of Pāṇini, and afterwards the Indo-Bactrian king Menander (144-124 B.C.), who, according to Strabo, extended his rule as far as the Yamunā.⁷ In the latter passage the use of the present is illustrated by the sentence, "We are sacrificing for Push-pamitra,"—this prince (178-142 B.C.), the founder of the Sunga dynasty, being known to have fought against the Greeks.⁸ We thus get the years 144-142 B.C. as the probable time when the work, or part of it, was composed. Although Kātyāyana probably gave us a few traditional grammatical examples mechanically repeated from his predecessors, those here mentioned are so fortunately such as, from the very nature of the case, must have been made by himself. The Mahābhāṣya is not a continuous commentary on Pāṇini's grammar, but deals only with those Sūtras (some 1720 out of a total of nearly 4000) on which Kātyāyana had proposed any Vārtikas, the critical discussion of which, in connection with the respective Sūtras, and with the views of other grammarians expressed thereon, is the sole object of Pātālīputra's monumental remarks. Though doubts have been raised as to the textual condition of the work, Prof. Kielhorn has clearly shown that it has probably been handed down in as good a state of preservation as any other classical Sanskrit work. Pātālīputra is also called Gonadiya,—which name Prof. Bhandarkar takes to mean "a native of Gonada," a place, according to the same scholar, probably identical with Gonāda, a town in the district of Gandhāra, and Gonikaputra, a son of Gonāka. Whether there is any connection between this writer and the reputed author of the Yagadāśia is doubtful. The Mahābhāṣya has been commented upon by Katyata, in his *Bhāṣyagopāṇīya*, and the latter again by Nāgobhāṭa, a distinguished grammarian of the earlier part of the last century, in his *Bhāṣya-pratipadādyā*.

Of running commentaries on Pāṇini's Sūtras, the oldest extant Kāśīā and most important is the *Kāśīā Vṛtti*, or comment of Kāśī vṛtti (Benares) the joint production of two Jaina writers of probably the first half of the 7th century, viz., Jayāditya and Vāmana, each of whom composed one half (four *adhyaṅga*) of the work. The chief commentaries on this work are Haradatta Miśra's *Padamāṇīya*, which also embodies the substance of the Mahābhāṣya, and Jineन्द्रa-buddhi's *Myṣa*.⁹

Educational requirements in course of time led to the appearance Modern of grammars, chiefly of an elementary character, constructed on a grammatical

¹ F. Kielhorn, *Kātyāyana end Pātālīputra*, 1876. The *Saṃgraha*, a huge metrical work on grammar, by Vyāṭhi, which is frequently referred to, doubtless belongs to this period.

² G. Weber, Goldastücken und M. Müller take the opposite view.
³ Part of this work was first printed by Ballakṛṣṇa, followed by a lithographed edition, by two Benares printers, 1871, and a photo-lithographic edition of the text and commentaries, published by the Indica Office, under Goldastücken's supervision, 1874. Finally, a critical edition, now in progress, by F. Kielhorn. For a review of the literary and antiquarian data supplied by this work, see A. Weber, *Ind. Ant.*, xii, 291 ff. The author's date has been frequently discussed, most thoughtfully and successfully by R. G. Bhandarkar in several papers. See also A. Weber, *Ind. Ant.* of F. L. p. 222.
⁴ Edited by F. Kielhorn, *Ind. Ant.*, xii, 291 ff. Lassen, *Ind. Ant.*, xii, 342.

⁵ As is also stated by Vasopala it cannot be later than the 12th century.

¹ Printed, with a commentary, at Calcutta, also, with notes, indexes, and an instructive introduction, by O. Böhtlingk.

² *J. e. s.* of Sakala, whence he is also called Śāketānana.

³ Compares G. Bühler's story, *Gründ und Gestalt*, p. 621 ff.

⁵ Pāṇini, *his place in Sanskrit literature*, p. 100.

⁶ See Lassen, *Ind. Ant.*, xii, 292, M. Müller, *Ind. Ant.* of A. S. Lat., p. 821, A. Weber, *Ind. Ant.*, p. 242.

more practical system of arrangement—the principal heads under which the grammatical matter was distributed usually being—rules of euphony (*śaṇḍa*), inflexion of nouns (*nāma*), generally including composition and secondary derivatives, the verb (*ākhyāta*), and primary (*śrīṭ-anta*) derivatives. In this way a number of grammatical schools¹ sprang up at different times, each recognizing a special set of Sūtras, round which gradually gathered a more or less numerous body of commentarial and subsidiary treatises. As regards the grammatical material itself, these later grammars supply comparatively little that is not already contained in the older works,—the difference being mainly one of method, and partly of terminology, including modifications of the system of technical terms. Of the grammars of this description the hitherto known the *Chanda-cyāna* is probably the oldest,—its author Chandra Acharya having flourished under King Abhinavaya of Kashmir, who is usually supposed to have lived towards the end of the 2d century, 2^d and in whose reign that grammarian is stated, along with others, to have revived the study of the Māhābhāṣiya in Kashmir. Only portions of this grammar, with a commentary by Anandadatta, have as yet been recovered.

The *Īkṣvāka*, or *Kāṭya*, is ascribed to Kūṇḍin, the god of war, whence this school is also sometimes called *Kaṇḍina*. The real author probably was Śaiva-varman, who also wrote the original commentary (*vṛtti*), which was afterwards recast by Durgasimha, and again commented upon by the same writer, and subsequently by Tillochana-dāsa. The date of the Kāṭyānta is unknown, but it will probably have to be assigned to about the 6th or 7th century. It is still used in many parts of India, especially in Bengal and Kashmir. Other grammars are the *Sāvatīrī* *Pāṇinīyā*, by Anubhūti, Śrīrāṇḍīyā, the *Śaṅkadevī-sūtra*, composed by Kramādīvara, and corrected by Jumaṇa-nandin, whence it is also called *Jamuna*, the *Hama-cyāna*,⁴ by the Jaina writa Hemachandra (1088-1172, according to Di Bhāṇa Dāyī), the *Mugha-bodha*,⁵ composed, in the latter part of the 13th century, by Vopadeva, the court pandit of King Mahādeva (Rāmaṇya) of Devagiri (or Dugar), the *Siddhanta-kavumūṭi*, the favourite text-book of Indian students, by Bhāṣṭī Dīkṣite (17th century), and a clever abridgement of it, the *Laghu* (*Siddhanta-kavumūṭi*),⁶ by Vaidiāyā.

Several subsidiary grammatical treatises remain to be noticed. The *Paribhāṣas* are general maxims of interpretation presupposed by the Sūtras. Those handed down as applicable to Pāṇini's system have been interpreted most ably by Nāgārjūṇa, in his *Paribhāṣasādhana*. The case of rules applying to whole groups of words, is completed by general rules of these words as given in the *Gaṇapāṭi*, and only referred to in the Sūtras. Vaidiāyāna's *Gaṇa-āna-mahādāṣa*,⁷ a comparatively modern recension of these lists (1140 A.D.), is valuable as offering the only available commentary on the Gaṇas which contain many words of unknown meaning. The *Dhātupāṭis* are complete lists of the roots (*dhātu*) of the language, with their general meanings. These lists handed down under this title,⁸ as arranged by Pāṇini himself, have been commented upon, amongst others, by Mādāhava. The *Uṇāḍi-sūtra* are rules on the formation of irregular derivatives. The oldest work of this kind, commented upon by Uṇṇadīśa,⁹ is by some writers ascribed to Kāṭyāyana Vairachara, by others even to Śāketiāyana. The oldest known treatise on the philosophy of grammar and syntax is the *Vākyapadīyā*,¹⁰ composed in verse, by Bhāṣṭīnārā (17th century), whence it is also called *Haridāśa*. Of later works on this subject, the *Vaiyākaraṇa-vāṇśana*, by Kṛṣṇabhaṭṭa, and the *Vaiyākaraṇa-siddhānta-māṇṣa*, by Nāgārjūṇa, are the most important.

IV LEXICOGRAPHY.—Sanskrit dictionaries (*koṣha*), invariably composed in verse, are either homonymous or synonymous, or partly the one and partly the other. Of those hitherto published, Śāvatā's *Anekāṅka-samucchaya*,¹¹ or "collection of homonyms," is probably the oldest. While in the later homonymic vocabularies the words are generally arranged according to the alphabetical order of the final (or sometimes the initial) letter, and then according to the number of syllables, Śāvatā's principle of arrangement—viz., the number of meanings assignable to a word—seems to be more primitive. The work probably next in time is the famous *Amara-koṣha*,¹² ("immortal treasury") by Amara-simha, one of "the nine gems" at the court of King Vikramāditya (c. 550 A.D.). This dictionary consists of a synonymous and a short homonymic part, whilst in the former the words are distributed in sections

according to subjects, as heaven and the gods, time and seasons, &c., in the latter they are arranged according to their final letter, without regard to the number of syllables. This *Koṣha* has found many commentators, the oldest of those known being Kāśhira-sāmn¹³. Among the works quoted by commentators as Amara's sources are the *Tiṇḍana* and *Upalini* *koṣha*, and the glossaries of Rabhasa, Vyāhi, Kāṭyāyana, and Vararūpa. A *Koṣha* ascribed to Vajrasūtra,—whose tradition makes one of the nine literary "gems," and hence the contemporary of Amara-simha,—consisting of ninety short sections, has been printed at Benares (1865) in a collection of twelve *Koṣhas*. The *Abhidhāna-ratna-mālā*,¹⁴ by Haliyūḍha, the *Vīṇapāṇḍita*, by Mahāyāra (1111), and the *Abhidhāna-chandimāṇ*¹⁵ (or *Hama-koṣha*), by the Jaina Hemachandra, seem all three to date to belong to the 12th century. Some what earlier than these probably is Ajāya Pāla, the author of the (homonymous) *Nāṇḍha-saṅgraha*, being quoted by Vardhamāna (1140 A.D.). Of more uncertain date is Puruṣottama Deva, who wrote the *Tiṇḍana-śeṣa*, a supplement to the Amarakoṣha, besides the *Hāḍḍi*, a collection of uncommon words, and two other short glossaries. Of numerous other works of this class the most important is the *Āṣṭāṅka*, a dictionary of homonyms, arranged in the first place according to the final and the syllabic length, and then alphabetically. Two important dictionaries, compiled by native scholars of the present century, are the *Siddhāntapadma* by Rādhākānta Deva, and the *Vāchस्पति*, by Tāminṭha Taika-vāchस्पति. A full account of Sanskrit dictionaries is contained in the preface to the first edition of H. Wilson's *Dictionary*, reprinted in his *Essays on Sanskrit Literature*, vol. iii.

PROSODY (*Chandas*).—The oldest treatises on prosody have already been referred to in the account of the technical branches of the later Vedic literature. Among more modern treatises the most important are the *Mṛta-saṅgita*, a commentary on Pīṅgala's Sūtra, by Haliyūḍha (perhaps identical with the author of the glossary above referred to), the *Vṛtta-andāra*, or "jewel-mine of metres," in six chapters, composed before the 13th century by Kāśhira Bhāṭṭa, with several commentaries; the *Chanda-maṇḍana*, likewise in six chapters, by Gaṇḍakāśha, the *Śrūṭa-bodha*, ascribed, probably wrongly, to the great Kāśhira, is a comparatively insignificant treatise, dealing only with the more common metres, in such a way that each couplet forms a specimen of the metre it describes. The *Vṛtta-dāraṇa* treats chiefly of Pīṅkati metres. Sanskrit prosody, which is probably not surpassed by any other either in variety of metre or in harmoniousness of rhythm, recognizes two classes of metres, viz., such as consist of a certain number of syllables of fixed length, and such as are regulated by groups of breves or metrical instants, this latter class being again of two kinds, according as it is or is not bound by a fixed order of feet. A pleasant account of Sanskrit poetics is given in Colebrooke's *Essays*, vol. i, a more complete and systematic one by Prof. Weber, *Ind. Stud.*, vol. viii.

VI MUSIC (*Saṅgīta*).—The musical art has been practised in India from early times. The theoretic treatises on practical music now extant are, however, quite modern productions. The two most highly esteemed works are the *Saṅgīta-ratnāvalī* ("jewel-mine of music"), by Śārṅgadeva, and the *Saṅgita-dāraṇa* ("mirror of music"), by Dāmodara. Each of these works consists of seven chapters, treating respectively of—(1) sound and musical notes (*svara*), (2) melodies (*rāga*), (3) music in connexion with the human voice (*prakāśhita*), (4) musical compositions (*prabandha*), (5) time and measure (*tala*), (6) musical instruments and instrumental music (*vadya*), (7) dancing and acting (*nṛtya* or *nritya*). The Indian octave consists like our own of seven chief notes (*svara*), but, while with us it is subdivided into twelve semi-tones, the Hindu theory distinguishes twenty-two intervals (*śruti*, audible sound). These is, however, some doubt as to whether these *śruti*s are quite equal to one another,—in which case the intervals between the chief notes would be unequal, since they consist of either two or three or four *śruti*s,—or whether, if the intervals between the chief notes be equal, the *śruti*s themselves vary in duration between quarter, third, and semi-tones. There are three scales (*grāma*), differing from each other in the nature of the chief intervals (either as regards actual duration, or the number of *śruti*s or sub-tones). Indian music consists almost entirely in melody, instrumental accompaniment being performed in unison, and any attempt at harmony being confined to the combination of the key-note. A number of papers, by various writers, have been reprinted with additional remarks on the subject, in Sourindro Mohan Tagore's *Hindu Music*, Calcutta, 1876. Compare also "Hindu Music," reprinted from the *Hindustan Patriot*, September 7, 1874.

VII REPERTORY (*Alaṅkāra-sūtra*).—Treatises on the theory of REPERTORY.

A grammarian of this name is mentioned as the tutor of King Jayasiddha of Kashmir (758-786 A.D.), but Kāśhira, the commentator on Amara is probably Prof. Anubhūti (between the 11th and 12th centuries, because he quotes the *Siddhānta* ascribed to Bhāṣṭīnārā).

literary composition are very numerous. Indeed, a subject of this description—involving such nice distinctions as regards the various kinds of poetic composition, the particular subjects and characters adapted for them, and the different sentiments or mental conditions capable of being both depicted and called forth by them—could not be congenial to the Indian mind. If H. Wilson, in his *Theory of the Vedānta*, has given a detailed account of these theoretic distinctions with special reference to the drama, which, as the most perfect and varied kind of poetic production, usually takes an important place in the theory of literary composition. The *Bharataśāstra* has already been alluded to as probably the oldest extant work in this department of literature. Another comparatively ancient treatise is the *Kāvyadāsa* of "a minor of poetry," in three chapters, by Dandin, the author of the novel *Dakṣiṇāmūrti*, who probably flourished not long after Kālidāsa (whose *Prākṛit* poem Setubandha he quotes) in the 6th century. The work consists of three chapters, treating—(1) of two different local styles (*śā*) of poetry, the Gauṇī and the Vaidarbhī (to which later critics add four others, the Pāṇchālī, Māgadhī, Lārī, and Avāntī), (2) of the graces and ornaments of style, as tropes, figures, similes, (3) of alliteration, literary puzzles, and two kinds of faults to be avoided in composing poems. Another treatise on rhetoric, in *Sūtras*, with a commentary entitled *Kāvyadāsa-ārthī*, is ascribed to Yāmuna. Prof. Cappelle, to whom we owe an edition of this work, is inclined to fix it as late as the 12th century, but it may turn out to be somewhat older. The *Kāvyadāsa*, by the Kashmirian Rudrata, must have been composed prior to the 11th century, as a gloss on it (by Nami), which seems to be based on the *Prākṛit*, was written in 1098. Dhanurjaya, the author of the *Dāsa-rāpa*, or "ten forms (of plays)," the favourite compendium of dramaturgy, appears to have flourished in the 10th century. In the concluding stanza he is stated to have composed his work at the court of King Muṅga, who is probably identical with the well-known Mūla-pura, the uncle and predecessor of King Bhoga of Dhāṭa. The *Uśāṭīpa* was very early commented upon by Dhanika, possibly the author, beyond whose father's name being the same (Viśvama). Dhanika quotes Rāṣaṅkara, who is supposed to have flourished about 1000 A.D., but may after all have to be put somewhat earlier. The *Saṁsavatī-kāvalībhāṇa*, "the neck-ornament of Saṁsavatī (the goddess of eloquence)," a treatise, in five chapters, on poetical generalities, remarkable for its wealth of quotations, is ascribed to King Bhoga himself (11th century), probably as a compliment by some writer patronised by him. The *Kāvyagūṇa*, "the lustre of poetry," another esteemed work of the same class, in ten sections, was probably composed in the 12th century,—the author, Maṇmata, a Kashmirian, having been the maternal uncle of Śrī-Harsha, the author of the *Nāṭyaśāstra*. The *Sāhitya-dāpanā*, or "mirror of composition," the standard work on literary criticism, was composed in the 15th century, on the banks of the Brahmaputra, by Viśvanātha Kavirāja. The work consists of ten chapters, treating of the following subjects—(1) the kinds of poetry, (2) the sentence, (3) poetic flavour (*rasa*), (4) the divisions of poetry, (5) the functions of literary suggestion, (6) visible and audible poetry (chiefly on dramatic art); (7) faults of style, (8) merits of style, (9) distinction of styles, (10) ornaments of style.

MEDICINE.

VIII. MEDICINE (*Āyur-veda*, *Vaidya-śāstra*).—Though the cultivation of the healing art is as early attested by frequent allusions in the *Vedic* literature, it was not till a much later period that the medical practice advanced beyond a certain degree of empirical skill and pharmaceutical routine. From the simultaneous mention of the three humours (wind, bile, phlegm) in a *vārtika* to Pāṇini (v. 1, 38), some kind of humoral pathology would, however, seem to have been prevalent among Indian physicians several centuries before our era. The oldest existing work is supposed to be the *Charaka-saṁhitā*, a bulky cyclopaedia in *śloka*s, mixed with prose sections, written about the 1st century B.C., and which composed some centuries after Christ. Of equal authority, but probably somewhat more modern, is the *Suśruta-saṁhitā*, which Suśruta is said to have received from Dhanvantari, the Indian Asclepius, whose name, however, appears also among the "nine gems" (c. 550 A.D.). It consists of six chapters, and is likewise composed in mixed verse and prose,—the greater simplicity of arrangement, as well as some slight attention paid in it to surgery, betokening an advance upon *Charaka*. Both works are, however, characterised by great prolixity, and contain much matter which has little connexion with medicine. The late Prof. E. Haas, in two very suggestive papers,¹ tried to show that the work of Suśruta

(identified by him with Soemates, so often confounded in the Middle Ages with Hippocrates) was probably not composed till after the Mohammedan conquest, and that, so far from the *Āstā* (as they themselves declare) having derived some of their knowledge of medical science from Indian authorities, the Indian *Vaidyaśāstra* was nothing but a poor copy of Greek medicine, as transmitted by the *Āstā*. But even though Greek influence may be traced in this as in other branches of Indian science, there can be no doubt,² at any rate, that both *Charaka* and *Suśruta* were known to the Arab Rāzī (c. 932 A.D.), and to the author of the *Fihrist* (completed 987 A.D.), and that their works must therefore have existed, in some form or other, at least as early as the 9th century. Among the numerous later medical works, the most important general compendiums are Vāgbhata's *Aśṭāṅga-hiṇḍya*, "the heart of the eight-limbed (body of medical science)," and Bhāva Miśra's *Bhāva-prakāśa*, while of special treatises may be mentioned Mādhava's system of nosology, the *Bhūrguṇīśāstra*, or *Mādhava-nidāna*, and Śiṅgadhara's compendium of therapeutics, the *Śiṅgadhara-saṁhitā*. Materia medica, with which India is so lavishly endowed by nature, is a favourite subject with Hindu medical writers,—the most valued treatise being the *Śārṅga-saṁhitā*, by the Kashmirian Naṣaṭra. The best general view of this branch of Indian science is contained in T. A. Wise's *Commentary on Hindu Medicine*, 1845, and in his *History of Medicine*, vol. 1, 1867, but the whole subject, including the principal original works, still awaits a critical investigation.

IX. ASTRONOMY AND MATHEMATICS.—Hindu astronomy may ASTRO-

be broadly divided into a pre-scientific and a scientific portion. While the latter clearly presupposes a knowledge of the researches of Hipparchus and other Greek astronomers, it is still doubtful whether the earlier astronomical and astrological theories of Indian writers were entirely of home growth or partly derived from foreign sources. From very ancient (probably Indo-European) times chronological calculations were based on the synodical revolutions of the moon,—the differences between twelve such revolutions (making together 354 days) and the solar year being adjusted by the insertion, at the time of the winter solstice, of twelve additional days. Besides this primitive mode the *Rāveda* also alludes to the method prevalent in post-Vedic times, according to which the year is divided into twelve (*āyana* or solar) months of thirty days, with a thirteenth month intercalated every fifth year. This quinquennial cycle (*yuga*) is explained in the *Yogishika*, regarded as the oldest astronomical treatise. An institution which occupies an important part in these early speculations is the calculation of the *zodiac*, a system of lunar mansions, by which the planetary path, in accordance with the duration of the moon's rotation, is divided into twenty-seven or twenty-eight different stations, named after certain constellations (*nakṣatra*) which are found alongside of the ecliptic, and with which the moon (*māsa*) was supposed to dwell successively during his circuit. The same institution is found in China and Arabia, but it is still doubtful³ whether the Hindus, as some scholars hold, or the Chaldeans, as Prof. Weber thinks, are to be credited with the invention of this theory. The principal works of this period are hitherto known from quotations only, viz., the *Gārgī Samhitā*, which Prof. Kern would fix at c. 650 B.C., the *Nārada Samhitā*, and others.

The new era, which the same scholar dates from c. 250 A.D., is marked by the appearance of the five original Siddhāntas (partly extant in revised editions and in quotations), the very names of two of which suggest Western influences, viz., the *Pāṇinīya-Śāstra*,⁴ *Pāṇinīya-Romanē*, (i.e., Roman), and *Pāṇinīya-Śāstra*. Based on these are the works of the most distinguished Indian astronomers, viz., Āryabhaṭa,⁵ probably born in 476, Varāha-miśra,⁶ probably 505-507, Bhāṣma-guṇa, who completed his *Brahma-siddhānta* in 628, Bhāṭa Ugrāla (10th century), distinguished especially as commentator of Varāha-miśra, and Bhaṣkara Āchārya, who finished his great work of astronomy, the *Siddhānta-siromani*, in 1150. In the works of several of these writers, from Āryabhaṭa onwards, special attention is paid to mathematical (especially arithmetical and algebraic) computations, and the respective chapters of Bhaṣkara's compendium, viz., the *Līlāvatī* and *Vyā-garita*,⁷ still form favourite textbooks of these subjects. The question whether Āryabhaṭa was acquainted with the researches of the Greek astronomer Diophantus (c. 300 A.D.) remains still unsettled, but, even if this was the case, algebraic science seems to have been carried by him beyond the point attained by the Greeks.

SANSON, NICOLAS (1600-1667), a French cartographer, who, while it is a mistake to call him the creator of French geography, attained a great and well-deserved eminence in his profession. He was born of an old Picardy family of Scottish descent, at Abbeville, on December 20, 1600, and was educated by the Jesuits at Amiens. The mercantile pursuit by which he first sought to make his living proved a failure, but in 1627 he was fortunate enough to attract the attention of Richelieu by a map of Gaul which he had constructed while still in his teens, and through the cardinal's influence he was appointed royal engineer in Picardy and geographer to the king. How highly his services were appreciated by his royal patrons is shown by the fact that when Louis XIII came to Abbeville he preferred to become the guest of Sanson (then employed on the fortifications), instead of occupying the sumptuous lodgings provided by the town. Sanson's success was embittered by a quarrel with the Jesuit Labbe, whom he accused of plagiarizing him in his *Pharus Galliarum Antiquae*, and by the death of his eldest son Nicolas, killed during the disturbances of the Fronde (1648). He died at Paris July 7, 1667. Two younger sons, Adrien (died 1708) and Guillaume (died 1703), succeeded him as geographers to the king.

Sanson's principal works are *Galliarum Antiquae Descriptio Geographica*, 1627, *Britannia*, 1638, in which he seeks to identify Strabo's Britannia with Abbeville (!), *La France*, 1644, *In Pharus Galliarum Antiquae Philippus Labbe Disquisitiones*, 1647-1648, and *Geographiae Sacrae*. In 1692 Jarlot collected Sanson's maps in an *Atlas Nouveau*. His cartography is generally bold and vigorous.

SANSOVINO, ANDREA CONTUCCI DEL MONTE (1460-1529), an able Florentine sculptor, who lived during the rapid decline of plastic art which took place from about the beginning of the 16th century; he was the son of a shepherd called Niccolo di Domenico Contucci, and was born in 1460 at Monte Sansovino near Arezzo, whence he took his name, which is usually softened to Sansovino. He was a pupil of Antonio Pollaiuolo, and during the first part of his life worked in the puer style of 15th-century Florence. Hence his early works are by far the best, such as the terra-cotta altar-piece in Santa Chiara at Monte Sansovino, and the marble reliefs of the Annunciation, the Coronation of the Virgin, a Pietà, the Last Supper, and various statuettes of saints and angels in the Corbinelli chapel of S. Spirito at Florence, all executed between the years 1488 and 1492. From 1491 to 1500 Andrea worked in Portugal for the king, and some pieces of sculpture by him still exist in the monastic church of Coimbra.¹ These early reliefs show strongly the influence of Donatello. The beginning of a later and more pagan style is shown in the statues of St. John baptizing Christ which are over the east door of the Florentine baptistery. This group was, however, finished by the weaker hand of Vincenzo Danti. In 1502 he executed the marble font at Volterra, with good reliefs of the Four Virtues and the Baptism of Christ. In 1505 Sansovino was invited to Rome by Julius II to make the monuments of Cardinal Ascanio Maria Sforza and Cardinal Giuliano della Rovere for the retro-choir of S. Maria del Popolo. The architectural parts of these monuments and their sculptured foliage are extremely graceful and executed with the most minute delicacy, but the recumbent effigies show the beginning of a serious decline in taste. Though skilfully modelled, they are uneasy in attitude, and have completely lost the calm dignity and simple lines of the earlier effigies, such as those of the school of Mino da Fiesole in the same church. These tombs had a very important influence on the monumental sculpture of the time, and became models

which for many years were copied by most later sculptors with increasing exaggerations of their defects. In 1512, while still in Rome, Sansovino executed a very beautiful group which shows strongly the influence of Leonardo da Vinci, both in the pose and in the sweet expression of the faces; it is a group of the Madonna and Child with St. Anne, now over one of the side altars in the church of S. Agostino. From 1513 to 1528 he was at Loretto, where he cased the outside of the Santa Casa in white marble, covered with reliefs and statuettes in niches between engaged columns, a small part of this gorgeous mass of sculpture was the work of Andrea himself, but the greater part was executed by Montelupo, Tribolo, and others of his numerous school of assistants and pupils. Though the general effect of the whole is very rich and magnificent, the individual pieces of sculpture are both dull and feeble, showing the unhappy results of an attempt to imitate Michelangelo's grandeur of style. The earlier reliefs, those by Sansovino himself, are the best, still retaining some of the sculptural piquancy of the older Florentines. He died in 1529.

SANSOVINO, JACOPO (1477-1570), was called Sansovino after his master Andrea (see above), his family name being Tatti. Born in 1477, he became a pupil of Andrea in 1500, and in 1510 accompanied him to Rome, devoting himself there to the study of antique sculpture. Julius II employed him to restore damaged statues, and while working in the Vatican he made a full-sized copy of the Laocoon group, which was afterwards cast in bronze, and is now in the Uffizi at Florence. In 1511 he returned to Florence, and began the statue of St. James the Elder, which is now in a niche in one of the great piers of the Duomo. Under the influence of his studies in Rome he carved a nude figure of Bacchus and Pan, now in the Bargello, near the Bacchus of Michelangelo, from the contrast with which it suffers much. Soon after the completion of these works, Jacopo returned to Rome, and designed for his fellow-citizens the grand church of S. Giovanni dei Fiorentini, which was afterwards carried out by Antonio Sangallo the younger. A marble group of the Madonna and Child, now at the west of S. Agostino, was his next important work. It is heavy in style, and quite without the great grace and beauty of the Madonna and St. Anne in the same church by his master Andrea. In 1537 Jacopo fled from the sack of Rome to Venice, where he was welcomed by his friends Titian and Pietro Aretino; henceforth till his death in 1570 he was almost incessantly occupied in adorning Venice with a vast number of magnificent buildings and many second-rate pieces of sculpture. Among the latter Jacopo's poorest works are the colossal statues of Neptune and Mars on the grand staircase of the dual palace, from which it is usually known as the "Giants' Staircase." His best are the bronze doors of the sacristy of St. Mark, cast in 1562; inferior to these are the series of six bronze reliefs round the choir of the same church, attempted imitations of Ghiberti's style, but unquiet in design and unsculptural in treatment. In 1565 he completed a small bronze gate with a graceful relief of Christ surrounded by Angels, this gate shuts off the altar of the Reserved Host in the choir of St. Mark's.

Jacopo's chief claim to real distinction rests upon the numerous fine Venetian buildings which he designed, such as the public library, the mint, the Scuola della Misericordia, the Palazzo de' Cornari, and the Palazzo Delfino, with its magnificent staircase,—the last two both on the grand canal, a small loggia which he built at the foot of the great Campanile, richly decorated with sculpture, has recently been pulled down and much damaged, but is being rebuilt. Among his ecclesiastical works the chief are the church of S. Fantino, that of S. Martino, near the

¹ See Raczninski, *Les Arts en Portugal*, Paris, 1846, p. 344.

arsenal, the Scuola di S. Giovanni degli Schiavoni, and, finest of all, the church of S. Gemignano, near St Mark's, a very good specimen of the Tuscan and Composite orders used with the graceful freedom of the Renaissance.

The otherwise prosperous course of the artist's life was interrupted by one serious misfortune. In 1545 the roof of the public library, which he was then constructing, gave way and fell in, on account of this he was imprisoned, fined, and dismissed from the office of chief architect of the cathedral, to which he had been appointed by a decree of the signoria on April 7, 1529. Owing, however, to the intervention of his friends, Titian, Pietro Aretino, and others, he was soon set at liberty, and in 1549 he was restored to his post. He did good service to the cathedral of St Mark's by strengthening its failing domes, which he did by encircling them with bands of iron. Sansovino's architectural works have much beauty of proportion and grace of ornament, a little marred in some cases by an excess of sculptured decoration, though the carving itself is always beautiful both in design and execution. He used the classic orders with great freedom and tasteful invention—very different from the dull scholasticism of most of his contemporaries. His numerous pupils were mostly men of but little talent.

SANTA ANNA, ANTONIO LOPEZ DE (1798–1876), for many years a prominent figure in the troubled politics of Mexico, was born at Jalapa on February 21, 1798. Having entered the army, he joined the party of ITURBIDE (*q v*) in 1821, and gained distinction and promotion by the part he took in the surprise and capture of Vera Cruz. In the following year he quarrelled with his chief and himself became leader of a party, but without in the first instance achieving success. In 1828, however, he sided with Guerrero, who made him war minister, and also commander-in-chief after a successful operation against the Spaniards in 1829. He successively accomplished the overthrow of Guerrero in favour of Bustamante and of Bustamante in favour of Pedraza, and finally in March 1833 was himself elected president. In 1836 he was defeated and taken by the Texan revolutionists, but returned to Mexico the following year. In 1844, after considerable vicissitudes, he was deposed and banished, but he was brought back once more to the presidential chair in 1846. This second term of office lasted till the fall of Mexico in 1847, when he resigned. He was made president again in 1853, but finally abdicated in 1855. In 1867 he took part in "pronunciamientos" which led to his banishment. In 1874 he was permitted to return to his native soil, where he died two years afterwards.

SANTA CRUZ. See SAINT CROIX. For SANTA CRUZ DE SANTIAGO see CANARY ISLANDS, vol iv p 799, and for SANTA CRUZ DE NITENDI ISLAND see NEW HEBRIDES, vol xvii p 395.

SANTA FE, a city of the Argentine Republic, capital of the province of Santa Fé (38,600 square miles, 189,000 inhabitants), occupies an area of 400 acres, 90 miles north of Rosario, on the north-east or left bank of the Rio Salado at its junction with the Paraná, in a district subject to periodical inundations. It is the seat of the governor, the bishop, and the legislature, and contains a cathedral, a Jesuits' church (1654) and college (the latter an important institution with 400 boarders), a new bishop's palace, a town-hall (with a fine tower), extensive infantry barracks, and a large market. A foundry, a macaroni-factory, oil-factories, and tile-works are the chief industrial establishments. The population in 1881 was 10,400, a decrease since 1869. Santa Fé was founded in 1573 by Juan de Garay.

SANTA FE, a city of the United States, capital of New Mexico, stands in a wide plain surrounded by moun-

tains about 7000 feet above the sea, in 35° 41' N lat and 105° 46' W long, near the Santa Fé Creek, which joins the Rio Grande del Norte 14 or 15 miles farther south-west. It is connected by a branch line (18 miles) with the Atchison, Topeka, and Santa Fé Railroad at Lamy Junction, 835 miles from Atchison. The houses are mainly constructed of adobe, and the irregularity of the plan shows how recently the city has come under the influence of "American" progress. Among the more noteworthy buildings are the new capitol, for which funds were voted in 1883, the Roman Catholic cathedral, erected since 1870, and the old governor's palace, a long low edifice occupying one side of the principal plaza, which now contains a soldiers' monument in honour of those who fell in the service of the United States. Santa Fé is an important centre of trade, and the development of the mining industries in the vicinity is rapidly increasing its prosperity. The population was 6635 in 1881.

One of the oldest cities of North America, Santa Fé de San Francisco was the capital of New Mexico from 1640, but remained in comparative seclusion till the early part of the present century, when it became a main station on what was called the Santa Fé Trail—the trade route between the United States and Mexico, or more especially between St Louis and Chihuahua. A custom-house was established in the city in 1821, and the first American mercantile house began business in 1826. By 1843 the value of the merchandises entrusted to the train of 280 wagons from St Louis was \$450,000. General Kearny built Fort Marcy at Santa Fé in 1846, and in 1851 the city became the capital of the new Territory. In 1862 it was occupied for a few days by the Confederates.

SANTA FÉ DE BOGOTÁ. See BOGOTÁ.

SANTAL PARGANAS, THE, a British district in the lieutenant-governorship of Bengal, forming the southern portion of the Bhāgalpur division, and lying between 23° 48' and 25° 19' N lat, and between 86° 30' and 87° 58' E long. The total area of the district is 5456 square miles, it is bounded on the north by the districts of Bhāgalpur and Purnali, on the east by Maldah, Murshidābād, and Bībhin, on the south by Bardwān and Mānblūm, and on the west by Hazāribāgh and Bhāgalpur. Three distinct types of country are represented within the area of the Santāl Parganās: in the east a sharply defined belt of hills stretches for about a hundred miles from the Ganges to the Nāmbūl River, west of this point a rolling tract of long ridges with intervening depressions covers an area of about 2500 square miles, while the third type is exemplified by a narrow strip of flat alluvial country about 170 miles long, lying for the most part along the loop line of the East Indian Railway. The Rajmahal Hills are the only range of any importance in the district, and occupy an area of 1366 square miles, but they nowhere exceed 2000 feet in height. Several other hill ranges occur, which are with few exceptions covered almost to their summits with dense jungle; they are all difficult of access; there are, however, numerous passes through all the ranges. Coal and iron are found in almost all parts of the country, but the coal is of such inferior quality that all attempts to work it have failed. Wild animals, including tigers, leopards, bears, hyenas, deer, and wild pig, with a variety of small game, are common almost everywhere. The climate varies: the alluvial tract has the damp heat and moist soil characteristic of Bengal, while the undulating and hilly portions are swept by the hot westerly winds of Behar, and are very cool in the winter months. The average annual rainfall is over 50 inches. The district is traversed on the east by the loop line, and on the west by the chord line, of the East Indian Railway, the total length of railway is about 130 miles.

The census of 1881 disclosed a total population in the Santāl Parganās of 1,568,098 (males 785,230, females 782,768), Hindus numbered 847,590, Mohammedans 108,899, and Christians 2087. The total number of persons belonging to the aboriginal tribes was 605,517, of whom the great majority (537,946) were Santāls.

For an account of this interesting tribe, see INDIA, vol. xii p. 778. The population is almost entirely rural, only two towns contain over 5000 inhabitants each, viz., Deoghar, which is the only municipality, with a population of 8015, and Shahabnagar with 6312. The administrative headquarters are at Gaya and Muzaffarpur.

Rice forms the staple crop of the Santal Parganas, and is largely grown in the alluvial strip of country which runs along the eastern boundary of the district. Other crops are millets, wheat, barley, maize, various pulses and oil-seeds, jute, flax, sugar-cane, cotton, and indigo. The district is singularly destitute of any local manufactures. Iron is roughly smelted by Kol settlers from Chutia Nagpur, coal-dust is used as a domestic manufacture, and bell-metal utensils are made to a small extent; indigo is also manufactured. The trade is carried on by means of permanent markets. Exports consist chiefly of rice, Indian corn, oil seeds, tasar-silk cocoons, lac, small-sized timber, and hill bamboos, while European piece goods, salt, and brass or bell-metal utensils for household use compose the bulk of the imports. In 1883-84 the gross revenue of the district amounted to £245,437, of which the land-tax yielded £22,556.

The Santals have been known to the British since the latter part of the 18th century. In 1832 two Government officials were deputed to demarcate with solid masonry pillars the present area of the Daman-i-Koh, or skirts of the hills. The permission to Santals to settle in the valleys and on the lower slopes of the Daman stimulated Santal immigration to an enormous extent. The Hindu money-lender soon made his appearance among them, and led to the rebellion of 1855-56. The insurrection was not quelled without bloodshed, but it led to the establishment of a form of administration congenial to the immigrants, and a land settlement has since been carried out on conditions favourable to the occupants of the soil.

SANTA MARIA. See CAPUA.

SANTA MAURA, or **LEUCADIA** (Λευκάδα, ancient Λευκάς), one of the Ionian Islands, with an area of 110 square miles and a population (1880) of 25,000 (30,892 in 1870), lies off the coast of Acarnania (Greece), immediately south of the entrance to the Gulf of Arta. It first appears in history as a peninsula (*Odyssey*, xxiv 378), and, if the statements of ancient authorities be accepted literally, it owed its existence as an island to the Corinthians, whose canal across the isthmus was again after a long period of disuse opened up by the Romans. But it is probable rather that Leucas was then as now separated from the mainland by a shallow lagoon (two feet or less). During the English occupation a canal for boats of four to five feet draught was formed from Fort Santa Maura to the town, but the 16-feet-deep ship canal which it was proposed (1844) to carry right across the lagoon or submerged isthmus to Fort Alexander was only partially excavated.¹ Santa Maura, measuring about 20 miles from north to south and 5 to 8 miles in breadth, is a rugged mass of limestone and bituminous shales (partly Tertiary), rising in its principal ridges to heights of 2000 and 3000 feet, and presenting very limited areas of level ground. The grain crop suffices only for a few months' local consumption, but olive oil of good quality is produced to the extent of 30,000 to 50,000 barrels per annum, the vineyards (in the west especially) yield 100,000 barrels of red wine (bought mainly by Rouen, Cete, Trieste, and Venice), the currant, introduced about 1859, has gradually come to be the principal source of wealth (the crop averaging 2,500,000 lb), and small quantities of cotton, flax, tobacco, valonia, &c., are also grown. The salt trade, formerly of importance, has suffered from Greek customs regulations. Though to a large extent unlettered and superstitious, the inhabitants are industrious and well-behaved. The chief town (5000 inhabitants) properly called Amaxikhi, but more usually Santa Maura, after the neighbouring fort, is situated at the north-east end of the island opposite the lagoon. In the south-west is the village of Vasiliki, where a wharf protected by a mole

was built in 1877-78 for shipping the currant crop. Remains of Cyclopean and polygonal walls exist at Kaligoni (south of Amaxikhi), probably the site of the ancient acropolis of Neritus (or Nereus), and of the later and lower Corinthian settlement of Leucas. From this point a Roman bridge seems to have crossed to the mainland. Between the town and Fort Santa Maura extends a remarkably fine Turkish aqueduct partly destroyed along with the town by the earthquake of 1825. Foits Alexander and Constantine commanding the bridge are relics of the Russian occupation, the other forts are of Turco-Venetian origin. The magnificent cliff, some 2000 feet high, which forms the southern termination of the modern island still bears the substructions of the temple of Apollo Leucatas (hence the modern name Capo Ducato). At the annual festival of Apollo a criminal was obliged to plunge from the summit into the sea, where, however, an effort was made to pick him up, and it was by the same heroic leap that Sappho and Artemisa, daughter of Lygdamis, are said to have ended their lives.

SANTANDER, a province in the north of Spain, on the shores of the Bay of Biscay, bounded on the E by Biscaya, on the S by Burgos and Palencia, and on the W by Leon and Oviedo. The area is 2113 square miles. The province is mountainous in character, being traversed from east to west by the Cantabrian chain, which in the Picos de Europa reaches a height of over 8700 feet, and sends off numerous branches to the sea. On the north side of the range the streams are all short, the principal being the Ason, the Miera, the Pas, the Besaya, the Soja, and the Nansa, which flow into the Bay of Biscay, part of the province lies to the southward of the watershed, and is drained by the upper Ebro. The valleys of Santander are fertile, and produce various kinds of grain, maize, pulse, hemp, flax, and vegetables. Oranges, lemons, grapes, figs, and other fruits flourish, and forests of oak, chestnut, walnut, and fir cover the hills. Rich pasturage for cattle and swine and a good supply of game are also found among them, and the fisheries along the coast are likewise productive. Foreign capital has been successfully applied to the development of lead, coal, and iron mines, and the mountains contain quarries of limestone, marble, and gypsum, and abound with mineral springs. The district was part of the Roman province of Cantabria, which, after passing under the empire of the Goths, became the principality of the Asturias. The portion called Asturia de Santa Juliana, or Santillana, was included in the kingdom of Old Castile, and, on the subdivision of the old provinces of Spain in 1833, became the province of Santander. The people are of a purer race than in parts of Spain subjected by the Moors, and both in mental and physical qualities show their Teutonic ancestry. The industries of the country are consequently in a flourishing condition, and, besides the natural products above mentioned, there are foundries, breweries, distilleries, tanneries, cotton, linen, cloth, and flour mills, brick and tile works, and manufactories of hats, soap, buttons, preserves, and chocolate. The province is traversed from north to south by the railway and high road from Santander by Palencia to Madrid, the highest point on the railway (Venta de Pazoal) is 3229 feet above the sea. For purposes of administration the province is divided into eleven partidos judiciales, containing 103 ayuntamientos, and returns two senators and five deputies to the cortes. The population in 1877 numbered 235,299. Besides Santander, the capital, the only places having within the municipal boundaries a population exceeding 5000 are Castro-Urdiales (7623), Valle de Pielagos (5500), Torrelavega (7192), and Valderredible (7240). Santoña has 4428, and Laredo 4384. Santillana (1776) has a fine Roman-

¹ As a six hours' shortening of the steam-passage between the Levant and the Adriatic would be effected by such a channel the scheme has again been taken up. According to M. Fyot, the engineer employed to report, the dredging could be done for 1,200,000 francs.

under the government of Ambrosio O'Higgins, it is now crossed by several handsome bridges, the oldest of which, a structure of eleven arches, dates from 1767-1779. From the very first Santiago was laid out with great regularity in parallelograms, but owing to the frequency of earthquakes the dwelling-houses are seldom built of more than a single story in height. The cathedral, situated in the Plaza de la Independencia, is the oldest of the churches. Originally erected by Pedro Valdivia and rebuilt by García Hurtado de Mendoza, it was destroyed by the earthquake of 1647 and rebuilt on a new plan subsequent to 1748. It is 351 feet long by 92 feet wide, but has no very striking features. Among the other ecclesiastical buildings are the church of San Agustín, erected in 1595 by Cristóbal de Vera and in modern times adorned with a pillared portico; the churches of San Francisco, La Merced, and Santo Domingo, dating from the 18th century, the Augustine nunnery founded by Bishop Medellín in 1576, the Carmen Alto, or church of the Carmelite nunnery, an elegant little Gothic building, the stately church of the Reformed Dominicans, rich in marble monolithic columns, and the chapel erected in 1852 to the memory of Pedro Valdivia next to the house in which he is reputed to have lived. The public cemetery, recently secularized, has a large number of marble and bronze monuments,—mostly from Italy. Among the secular buildings the more noteworthy are the palace of the intendancy, the old presidential palace (popularly Las Cayas), the congress buildings, the mint, the palace of justice, the municipal theatre. The present university of Santiago dates from 1842,—the older Universidad de San Felipe, which had been established in 1747, having been closed in 1839. It occupies a fine building in the Alameda, and alongside stands the great National Institute of Secondary Education. In 1882 the university was attended by 920 students and the institute by 1059. The city also contains a school of arts and trades (1849), a musical conservatory (1849), a national museum, a military school established in 1842 and enlarged on the abolition of the naval military school at Valparaíso in 1873 (now re-established), and a school of agriculture founded by the Agricultural Society chartered in 1869. The National Library is a noble collection of books dating from 1813, especially rich in works relating to America, there is also a good library in the National Institute. Besides the official journal, Santiago has four daily papers, as well as various reviews and other serials. Besides the Alameda, a great tree-planted avenue decorated with statues (the Abbé Molina, Generals San Martín, Carrera, O'Higgins, and Fierre, &c.), the principal open spaces in Santiago are the Plaza de la Independencia, the Canadilla, a broad tree-bordered avenue, the Alameda de Yungay, the Campo de Marte (where are the Penitentiary, a prison built and administered according to the most approved modern principles, and the large Artillery Park), the Quinta Normal de Agricultura, which comprises zoological and botanical gardens, and the large area in which the International Exhibition of 1875 was held. As the Mapocho was unfit for drinking, water was introduced about 1865 by an aqueduct 5 miles long. The prevailing winds at Santiago are from the south and south-west. On an average rain falls for 216 hours in the course of the year, mostly between May and September. Snow and hail are both extremely rare. Earthquakes are so frequent that as many as twenty-seven or thirty shocks are sometimes registered in a year. Those which have proved really disastrous are the earthquakes of 17th March 1875, 13th May 1847, 8th July 1730, 19th November 1822, and 20th February 1835. The population of Santiago, which was returned in 1865 as 168,553 (79,920 males and 88,633 females), had increased to 200,000 in 1883.

It was in February 1511 that Pedro de Valdivia, one of Pizarro's captains, founded the city of Santiago del Nuevo Extremo in accordance with a vow he had made at Cuzco. The place has all along held an important position in Chilean history, but perhaps none of the events with which it is associated sent such a sensation through the world as the burning of the Jesuit church with the loss of more than two thousand lives in the flames (5th December 1863).

SANTIAGO DE COMPOSTELLA, the former capital of Galicia, in the north-west of Spain, situated in 42° 52' 30" N lat and 8° 30' 6" W long, 51½ miles west-by-south from Lugo, and 32 miles south-by-west from Corunna, in the province of that name. It lies on the eastern slope of the Monte Pedreño, surrounded by mountains which draw down incessant rain that gives the granite buildings of its deserted streets an extra tint of melancholy and decay. The city is still the seat of a university and of an archbishopric, which lays claim to the primacy of all Spain, but its former glories have quite departed. In the Middle Ages its shrine, which contained the body of St James the Great, was one of the most famous in Europe, and gathered crowds of pilgrims from all parts. The city became, in fact, the focus of all the art and chivalry of neighbouring Christendom, and a spot where conflicting interests could meet on neutral ground. But the days of pilgrimages are past, and, though the Congregation of Ilites declared in 1884 that the cathedral still enshrines the veritable body of the apostle, pilgrims are scarcely more often seen than in any other cathedral town. The trade of Santiago can never have been otherwise than dependent on the crowds of pilgrims who visited the shrine. It now only survives in the silversmiths' shops on the Plaza de los Plateros, which still have a steady sale for artistic pieces of peasant jewellery. Otherwise it consists in mere local traffic in cattle, linen, silk, leather, hats, and paper. There is communication by rail with the little seaport of Carril on the west coast. The population within the municipal boundaries was 23,000 in 1885.

The relics of the saint were said to have been discovered in 885 by Theodomir, bishop of Lina, who was guided to the spot by a star, whence the name (*Campus Stellæ*). A chapel was forthwith erected, and the bishopric was transferred thither by a special bull of Pope Leo III. A more substantial building was begun in 868, but was totally destroyed in 987 by Almanzor, who, however, respected the sacred relics. On the reconquest of the city by Bermudo III. the roads which led to it were improved by that monarch, and pilgrims began to flock to the shrine, which fast grew in reputation. In 1078 the erection of the present cathedral was begun during the episcopate of Diego Peláez, and was continued until 1188, when the western doorway was completed. It is a cruciform building in the Romanesque style, 280 feet long, 80 feet wide, and 70 feet high, and keeps its original form in the interior, but is disfigured externally by much poor late work. Besides the classic dome and clock-tower, the two western towers have been raised to a height of 220 feet and crowned with cupolas, and between them has been erected a classic portico, above which is a niche containing a statue of St James. The facade was the work of Gaspar de Noya in 1738, and is a stately baroque chapel, designed by Rodríguez in 1764. The design is mediocre, and gains its chief effect from forming part of an extended architectural composition on the Plaza Mayor, a grand square which is surrounded on all sides by public buildings. The ground rises to the cathedral, which is reached by a magnificent quadruple flight of steps, flanked by statues of David and Solomon. Access to the staircase is given through some fine wrought-iron gates, and in the centre, on the level of the Plaza, is the entrance to a stately chapel, La Iglesia Baja, constructed under the portico and contemporary with the cathedral. To the north and south, and in a line with the west front, are dependent buildings of the 18th century, grouping well with it. Those to the south contain a light and elegant arcade to the upper windows, and serve as a screen to the cloisters, built in 1833 by Fonseca, afterwards archbishop of Toledo. They are said to be the largest in Spain, and are a fine example of the latest Gothic. The delicate sculpture over the heads of the windows and along the wall of the cloister is very noticeable. On the north of the cathedral is the Plaza de San Juan, where the peasants collect to do their marketing. Here is the convent of St Martin, built in 1636, which, after serving as a barracks, is now used as an ecclesiastical seminary, restored to the church. It has

a tolerable cloister and bell-tower. The north side of the cathedral is much overlaid by classical and Churriguesque work, and the same treatment has been applied to the east end, where is the Puerta Santa, which is kept closed, except in jubilee years, when it is opened by the archbishop. The corner of the south transept on the Plaza de los Plateros has been mutilated by the erection of the clock-tower, but the façade is fortunately preserved intact. Perhaps the chief beauty of the cathedral, however, is the Portico de la Gloria, behind the western classic portal. It is a work of the 12th century, and probably the utmost development of what round-arched Gothic is capable. The shafts, tympana, and archivolts of the three doorways which open on to the nave and aisles are a mass of strong and nervous sculpture. The design is a general representation of the Last Judgment, and the subjects are all treated with a quaint grace which shows the work of a real artist. Paint traces of colour remain and give a tone to the whole work. The cathedral is at such a height from the ground that it is probable that, until the erection of the present grand staircase, the portico could not be reached from the Plaza, but stood open to the air. There are no marks of doors in the jambs, and the entrance to the chapel beneath would have been blocked by any staircase which differed much in plan from the present one. The interior of the church is one of the purest and best examples of Renaissance work to be met with in Spain. The absence of a cloister throws an impressive gloom over the barrel-vaulted roof, which makes the building seem larger than it is. A passage leads from the north transept to the Parroquia of San Juan, or La Cotoella, a small but interesting portion of the original foundation. Many fine examples of metal work are in the cathedral, as, for instance, the two bronze ambons in the choir, by Juan B. Celma of 1563, the gilt chandeliers of 1763, and the enamelled shrines of Sta. Cucufato and Fuchoso. In the Capilla del Relicario are a gold crucifix, dated 874, containing a piece of the true cross, and a silver gilt custodia of 1544. The Hospicio de los Reyes, on the north of the Plaza Mayor, for the reception of pilgrims, was begun in 1504 by Enrique de Egas under Ferdinand and Isabella. It consists of two Gothic and two classical courtyards with a chapel in the centre. The gateway is fine, and there is some vigorous carving in the courtyards, one of which contains a graceful fountain. The suppressed Colegio de Fonseca and the adjoining convent of S. Gerónimo have good Renaissance doorways. The university, which was created in 1504 by a bull of Pope Julius II., has four Renaissance buildings, which date from 1522. Those of the Seminario (1777) have no merit. The chapel of the convent of S. Francisco, the cloisters of the convent of S. Augustin, the balcony of S. Domingo, the church of S. Felix de Colonia, which is a modernized building of the 14th century, and the façades of several houses of the 12th and 13th centuries are also good examples of different architectural styles.

SANTIAGO (or **ST JAGO**) **DE CUBA**, a city and seaport of Cuba, at one time the capital of the whole island, and now the chief town of the eastern department, is situated in 19° 57' 7" N lat. and 75° 54' 3" W long (highhouse), on a fine bay on the south coast. The spacious and well-defended harbour is accessible to the largest vessels, but silt near the wharf allows only those drawing less than 14 feet to come alongside. The city, which climbs a hill-side 150 feet above the bay, has considerably improved since 1870, though its streets are still badly paved. It contains the largest cathedral in the island, a theatre, a custom-house, barracks (1853-1880), and hospitals. Foundries, soap-works, tan-yards, and cigar factories are the only industrial establishments. The exports were valued in 1867 at £1,650,000, in 1882 at £1,032,200, and in 1883 at £722,632. Besides sugar, which forms about two-thirds of the whole, the principal articles are cocoa, rum, tobacco and cigars, coffee, honey and wax, mahogany, and copper-ore—this last at one time to the extent of 25,000 tons per annum, but now in greatly diminished quantity. The copper mines Lomas del Cobre lie on the other side of the bay inland from Punta de San The estimated population is between 24,000 and 30,000.

Founded by Diego Velazquez in 1514, and incorporated as a city in 1522, Santiago is memorable mainly for the French occupation and ransom in 1558, and the affair of the ship "Virgenius" in 1873, which resulted in the Spanish Government paying an indemnity to the United States for the murder of Captain Fry and his companions.

SANTIAGO DEL ESTERO, chief town of the province of Santiago in the Argentine Republic, is situated in 27°

46' S lat and 64° 19' W long, 520 feet above the sea, on the banks of the Rio Dulce. It is the residence of the provincial governor and the seat of the legislature, and it ranks as the oldest European city in the republic, having been founded by Aguirre in 1552. The most conspicuous building is the cathedral, whose dome contrasts strangely by its size and evident costliness with the poverty of the rest of the town. The population is about 8000 (most of whom have a great deal of Indian blood in their veins). The railway from Rosario to Santiago (689 miles) was opened in 1884.

SANTILLANA, **INIGO LOPEZ DE MENDOZA**, MARQUIS or (1398-1458), Castilian poet, was born at Carrion de los Condes in Old Castile on August 19, 1398. His father, Don Diego Hurtado de Mendoza, grand admiral of Castile, having died while Inigo was still quite young, the boy was brought up by his uncle Don Alfonso Enriquez. From his twentieth year onwards he became an increasingly prominent figure at the court of Juan II of Castile, distinguishing himself both in civil and military service, he was created Marques de Santillana and Conde del Real de Manzanares for the part he took in the battle of Olmedo in 1445. In the protracted struggle of the Castilian nobles against the preponderating influence of Alvaro de Luna he showed great moderation, but ultimately in 1452 he joined the combination which effected the fall of the favourite in the following year. From the death of Juan II in 1454 Mendoza took little part in public affairs, devoting himself mainly to the pursuits of literature and to pious meditation. He died at Guadalajara on March 26, 1458.

Mendoza was the first to introduce the Italian sonnet into Castile, but his imitations in this class are somewhat conventional in style and have a little to recommend them beyond the charm of smooth versification. He was much more successful in the *serenita* or highland pastoral after the Provençal manner. His long-popular *Centiloquio* (1494), consisting of one hundred proverbs, each intended in an eight-line stanza, was prepared at the request of Juan II for the instruction of Don Enrique, the heir-apparent. To the same didactic category belong the *Enseño de Buas con la Fortuna* (1448) and the *Doctrinal de Privados* (1453). The *Comedieta de Ponza* is a Danteque dream-dialogue, in octave stanzas, founded on the disastrous sea-flight off Ponza in 1435, when the kings of Aragon and Navarre along with the infant of Castile were taken prisoners by the Genoese.

The works of Santillana have been edited with commentaries by Amador de los Rios (Madrid, 1827).

SANTINI, **GIOVANNI** (1787-1877), Italian astronomer, born 30th January 1787 at Caprese, in the province of Arezzo, was from 1813 director of the observatory at Padua. He wrote *Elementi di Astronomia* (2 vols. 1820, 2d ed. 1830), *Teoria degli Strumenti ottici* (2 vols. 1828), and a great many scientific memoirs and notices, among which are five catalogues of telescopic stars between +10° and -15° declination, from observations made at the Padua observatory. He died June 26, 1877.

SANTO DOMINGO. See **HAYTI**.

SANTORIN. See **THIERA**.

SANTOS, a city and seaport of Brazil in the province of São Paulo, is situated on the north side of the island of São Vicente or Engua-Guac, which forms the west side of the harbour-bay (an inlet $3\frac{1}{2}$ miles deep, with soundings varying from 4 to 10 fathoms). It is a well-built town with wide airy streets, and most of the better classes have their residences at Barra Fort (4 miles out) and other suburban villages. Commercially the town has grown to great importance as the terminus of the whole railway system of this part of Brazil—the Santos and Jundiahy line (1867) running inland 87 miles and connecting with the São Paulo and Rio de Janeiro Railway and various other lines. The export of coffee (the great staple) increased from 344,800 60-kilogramme bags in 1862-3 to 537,478 in 1872-3 and 1,932,194 in 1883-4. The value of the coffee was estimated at £1,630,275 in 1870-71, and at

£3,632,838 in 1878-79. The export and import trade is estimated to circulate £10,000,000 a year. The population has increased since 1870 from 9000 to about 15,000.

As the city of São Vicente, the first permanent Portuguese settlement in Brazil, began to decline from its position as capital of the southern provinces, Santos, founded by Braz Cubas in 1543-46, gradually took its place. In the 17th century it was besieged by the Dutch and English. The provincial assembly passed an enactment by which the city was to be called *Cidade de Bonifácio* in honour of José Bonifácio d'Andrade e Silva, the national patriot, to whom it had given birth, but the older name of Santos held its ground.

SÃO LEOPOLDO, a German colony in the province of Rio Grande do Sul, Brazil, founded in 1824. It is connected with Porto Alegre by rail and also by the Rio do Jinos, a small but deep and navigable river. The inhabitants of the town and sixteen neighbouring settlements number in all about 20,000, and are engaged in cattle-breeding and in the culture of grain, arrow-root, and sugar.

SAÔNE. See RHONE

SAÔNE, HAUTE, a department in the north-east of France, formed in 1790 from the northern portion of Franche Comté, and traversed by the river Saône. Situated between 47° 14' and 48° 1' N lat. and between 5° 21' and 6° 49' E long., it is bounded N by the department of the Vosges, E by the territory of Belfort, S by Doubs and Jura, and W by Côte-d'Or and Haute-Marne. On the north-east, where they are formed by the Vosges, and to the south along the course of the Ognon the limits are natural. The highest point of the department is the Ballon de Servance (3900 feet), and the lowest the confluence of the Saône and Ognon (610 feet). The general slope is from north-east to south-west, the direction followed by those two streams. In the north-east the department belongs to the Vosgian formation, consisting of pure-clad mountains of sandstone and granite, but throughout the greater part of its extent it is composed of limestone plateaus 800 to 1000 feet high pierced with crevasses and subterranean caves, into which the rain water disappears to issue again as springs in the valleys 200 feet lower down. In its passage through the department the Saône receives from the right the Amance and the Salon from the Langres plateau, and from the left the Coney, the Lanterne (augmented by the Breuchin which passes by Luxeuil), the Durgeon (passing Vesoul), and the Ognon. The north-eastern districts are cold in climate and have an annual rainfall ranging from 36 to 48 inches. Towards the south-west the characteristics become those of the Rhone valley generally. At Vesoul and Gray the rainfall only reaches 24 inches per annum.

Out of a total of 1,319,570 acres 664,846 are arable, 375,999 under forest, 153,278 natural meadows and orchards, and 81,753 vineyards. The agricultural population numbers 180,393 out of a total of 295,905. They possess 23,381 horses, 159,609 cattle, 63,000 sheep, 72,678 pigs, 7094 goats, more than 19,000 dogs, and 15,816 beehives (40 tons 15 ewts of honey in 1881). Wheat is the staple crop—2,727,425 bushels in 1885, next come oats, 3,188,322 bushels, potatoes, 8,175,673 bushels, wine, mostly of middling quality, 4,887,652 gallons (average vintage for the last ten years 6,086,652 gallons), rye, 449,808 bushels, barley, 399,340, meslin, 276,251; buckwheat, 63,945, maize, 64,924, millet, 154, corn, 458 tons, beet-root, 26,865 tons, pulses, 5692 bushels, hemp, linen, tobacco, hops. The woods, which cover more than a quarter of the department, are composed of firs in the Vosges and beech trees, oaks, yew elms, and aspens in the other districts. Kirschwasser is manufactured at Fougèresolles from the native cherries. The industrial population numbers 51,477, 550 workmen raise 143,842 tons of iron-ore yearly, copper, silver, and manganese exist in the department, and gold occurs in the bed of the Ognon. Rock-salt mines yield annually 11,000 tons of salt and the materials for a considerable manufacture of sulphuric, hydrochloric, and nitric acids, sulphate of soda, chloride of lime, and Epsom and Glauber salts. Coal mines, with their principal centre at Ronchamp, give employment to more than 2000 workmen, and in 1883 yielded 212,680 tons of coal. Peat, limestone plaster,

building-stone, marble, porphyry, granite, syenite, and sandstone are all worked in the department. The green porphyry pedestal of Napoleon's sarcophagus at Les Invalides and the syenite columns of the Grand Opéra in Paris were cut at Servance. Of the many mineral waters of Haute-Saône the best known are the hot springs of Luxeuil, which, with their sixteen saline and two chalybeate sources, discharge over 127,000 gallons in the 24 hours and are used for bathing and drinking. Besides forty-seven iron-working establishments (smelting furnaces, foundries, and wire-drawing mills, producing in 1883 4875 tons of iron smelted by wood-fuel, 286 tons of refined iron and 1040 tons of sheet-iron, &c.), Haute-Saône possesses copper-foundries, engineering works, steel-foundries, and factories for producing tin plate, nails, pins, files, saws, screws, shot, chains, agricultural implements, locks, spinning machinery, edge tools, &c. Window-glass is manufactured by 165 workmen and glass vases by 300, pottery and earthenware by 220 to 230. There are also about 100 brick and tile works, the paper-mills employ 329 hands, and the 21 cotton-mills (66,700 spindles and 2518 looms, of which 154 are hand-loom) upwards of 2000. Print-works, fulling mills, hosiery factories, and straw-hat factories are also of some account, as well as sugar-works, dye-works, saw-mills, starch-works, chemical works, oil-mills, tanneries, and flour-mills. The department exports wheat (833,000 bushels), cattle, iron-wood, pottery, kirschwasser, and cooper's wares. The Saône provides a navigable channel of 40 miles, which is about to be connected with the Moselle and the Meuse by the Canal de l'Est in course of construction along the valley of the Coney. Gray is the great emporium of the water-borne trade, estimated at 200,000 tons per annum. The department has 156 miles of national roads, 3813 miles of other roads, and 235 miles of railway—the Paris-Mulhouse and Nancy-Gray railways, crossing at Vesoul, and various other lines. There are three arrondissements,—Vesoul, Gray (7254 inhabitants in the town), Luxeuil (4890),—28 cantons, 638 communes. Haute-Saône is in the district of the 7th corps d'armée, and in its legal, ecclesiastical, and educational relations depends on Besançon (4876 inhabitants), the most important place after the sub-prefecture, is celebrated for its abbey, founded by St Columban in 590.

SAÔNE-ET-LOIRE, a department of the east central region of France formed in 1790 from the districts of Autunois, Brionnais, Chalonnais, Charollais, and Maconnais previously belonging to Burgundy. Lying between 46° 9' and 47° 9' N lat., 3° 37' and 5° 27' E long., it is bounded on the N by the department of Côte-d'Or, E by that of Jura, S E by Ain, S by Rhône and Loire, W by Allier and Nièvre. The two streams from which it takes its name bound the department on the south-east and on the west respectively. Between these the continental watershed between the Mediterranean and the Atlantic called the Charollais Mountains runs south and north. Its altitude (2500 feet on the south) diminishes to the north in the direction of Côte-d'Or. The culminating point of the department is in the heights of Morvan, on the border of Nièvre (2960 feet). The lowest point, where the Saône leaves the department, is under 550 feet. The Saône crosses the department from north to south, and receives on its right the Dheune, followed by the Canal du Centre and the Grosne, and on its left the Doubs and the Saïlle. The Loire only receives one important affluent from the right, the Arroux, which is increased by the Bourbince, whose valley is followed by the Canal du Centre. The average temperature is slightly higher at Mâcon than at Paris—the winters being colder and the summer hotter. The yearly rainfall (32 inches, increasing towards the hilly districts) is distributed over 135 days; there are 25 days of snow and 27 of storm.

Of a total area of 3,119,311 acres (this is one of the largest of the French departments), 1,079,395 are arable, 371,866 forest, 299 the natural meadows and orchards, and 106,111 vineyards. In 1880 the live-stock comprised 26,000 horses, 6000 asses and mules, 75,000 bulls and oxen, 150,000 cows and heifers, 56,000 calves, 216,000 sheep, 175,000 pigs, 50,000 goats, 35,000 beehives (yielding 214 tons of honey and 52 tons of wax). The white Charollais oxen are one of the finest French breeds, equally suitable for labour and fattening. No fewer than 363,262 of the inhabitants of the department out of a total of 625,559 depend on agriculture. In 1888 there was produced 3,678,275 bushels of wheat, 222,880 meslin, 1,022,037 rye; in 1880 210,375 bushels of barley, 754,875 buckwheat, 809,325 maize, 101,970 millet, 2,107,187 tons, 13,859,307 potatoes, 38,500 pulses, 70,938 tons of beet-root, 206 tons hemp, 195

tons hempseed, 135,800 bushels colza-seed, 3177 tons colza oil. In 1883 the vintage yielded 22,636,696 gallons of wine, the average quantity of recent years being 21,809,018 gallons. The red wines of Mâconnais (especially those of Tholans) are those in highest repute; Pouilly produces the best white wines. The industrial classes are represented by 150,933 individuals. The coal-basin of Creusot, the sixth in importance in France, produced in 1882 1,255,783 tons. A pit at Épinac is 937 feet deep. Iron-ore was extracted in 1882 to the amount of 28,654 tons. Slate, limestone, building-stone, millstones, granite, marble, mail, plaster, bituminous schists, peat, kaolin, manganese (4360 tons per annum), and certain precious stones are also found in the department. The most celebrated mineral waters are those of Bourbon-Lancy, six out of the seven springs being thermal. They are strongly saline. Metal-working is principally carried on at Creusot, which, with its 13,000 workmen and its 19 smelting furnaces, 100 puddling ovens, 4 Bessemer apparatuses and 4 Martin's ovens, &c., produced in 1882 63,989 tons of iron (965 tons of rails, 21,984 tons of sheet-iron) and 99,823 tons of steel (72,055 tons of rails, 7056 tons of sheet-iron). The engine works produce all sorts of machines, including about 100 locomotives. The Châlon branch works turn out ships, boats, bridges, and boilers. Other foundries and forges in the department produced in 1882 175,113 tons of cast iron and certain quantities of copper and bronze. The cotton manufacture employs 14,000 spindles and 2000 looms, silk 2900 spindles and 2500 hand-loom, wool-spinning 830 spindles. Other industrial establishments are potteries, tile-works, glass-works (6,000,000 bottles at Épinac alone), distilleries, oil-works, mineral-oil works, cooperages, tanneries, flour-mills, sugar-works—the total number being 850 with 1872 steam engines of 27,739 horse power. The commerce of the department, especially as regards its exports, deals mainly with coal, metals, machinery, wine, cattle, bricks, pottery, glass. It is facilitated by five navigable streams (181 miles),—Loire, Arroux, Saône, Doubs, Saône,—the Canal du Centre which unites Châlon-sur-Saône with Digoin on the Loire, and the canal from Roanne to Digoin and the lateral Loire Canal, both following the main river valley. The total length of the canals is 90 miles. There are 865 miles of national road, 7098 of other roads, and 437 miles of railway. Saône-et-Loire forms the diocese of Autun; it is part of the district of the 8th corps d'armée (Bourges), and its university is that of Lyons. It is divided into five arrondissements,—Mâcon, Châlon-sur-Saône, Autun, Châlonnais (3350 inhabitants in the town), Louhans (4280),—50 cantons, and 539 communes, the most populous commune is Creusot (28,000 inhabitants, 16,000 in the town). Montceau-les-Mines (4500) is also a mining centre. Chagny (3500) is celebrated for its abbey, now occupied by the normal school of secondary instruction, and Paray-le-Monial (300) for its pilgrimage.

SÃO PAULO, a city of Brazil, capital of a province of the same name, is situated on the north-western slope of the Serra do Mar, on a left-hand tributary of the Tietê, a affluent of the Paraná. It is an old and irregularly built city, with some picturesque old churches and convents. The centre of the provincial railway system, 86 miles distant from SANTOS (*q.v.*), its seaport on the Atlantic coast, and 143 miles from Rio de Janeiro, the city has developed very rapidly within recent years. One of the two academies of law which Brazil possesses is seated at São Paulo. The most important public buildings are the cathedral, the provincial governor's and the bishop's palaces, and the theatre. A new system of water-supply and drainage was constructed in 1879–80 by English engineers under a Brazilian company. The population of the city in 1879 numbered about 35,000.

Founded by the Jesuits as a college, São Paulo was made a town in 1560 instead of Santo André, destroyed by order of Mendo de Sa. In 1711 it became a city, in 1740 a bishopric, and in 1823 an "imperial city."

SÃO PEDRO DO RIO GRANDE DO SUL See RIO GRANDE DO SUL.

SAPOR (ΣΑΠΨΡ or ΣΑΠΨΗΡ), the name of three Sásanian kings. See PERSIA, vol. xviii pp. 608–610.

SAPPAN WOOD is one of several red dyewoods of commerce, all belonging to the Leguminosae genus *Cassipourea*, or to the closely allied genus *Peltophorum*. It is a native of tropical Asia and the Indian Archipelago, but, as it is one of the most esteemed of the red dyewoods, its cultivation has been promoted in the West Indies and Brazil. The wood is somewhat lighter in colour than Brazil wood and its other allies, but the same tinctural

principle, brazilin, appears to be common to all. See BRAZIL WOOD, vol. iv. p. 241.

SAPPHIRE, a blue transparent variety of corundum or native alumina. It differs, therefore, from the Oriental ruby mainly in its colour. The colour varies from the palest blue to deep indigo, the most esteemed tint being that of the blue cornflower. It often happens that a crystal of sapphire is pearlyclouded, and hence a fine cut stone may derive its tint from a deep-coloured portion at the back, instead of being uniformly tinted throughout. The sapphire is dichroic, and the colour of a fine velvety stone may be resolved by means of the dichroscope into an ultramarine blue and a yellowish-green. The origin of the blue colour of the sapphire has not been satisfactorily determined, for, although oxide of cobalt may produce it, and is invariably used for colouring imitations of the stone, yet the presence of cobalt is not always revealed in the analysis of the sapphire. According to lapidaries the hardness of the sapphire slightly exceeds that of the ruby, and it is therefore the hardest known mineral, excepting diamond. In consequence of its great hardness it was generally mounted by the ancients in a partially rough state, the surface being polished but not cut. Notwithstanding its hardness it has been occasionally engraved as a gem. There seems no doubt that the ancient *σάπφειρος*, as well as the sapphire (ספיר) of the Old Testament (Job xxviii. 6), was our lapis lazuli, while the modern sapphire seems to have been known under the name of *δάκρυος* or *hyacinthus* (King).

The finest sapphires are obtained from Ceylon, where they occur with other gemstones as pebbles or rolled crystals in the sands of rivers. The sapphires have generally preserved their crystalline form better than the associated rubies. Some of the slightly-cloudy Ceylon sapphires display when cut *en cabochon* an opalescent star of six rays, whence they are called *star-sapphires* or *asteras*. The principal localities in Ceylon yielding sapphires are Rakewana, Ratnapura, and Satawaka. A few years ago sapphires were discovered in Siam (in the province of Battambang), but the stones from this locality are mostly dull and of too dark a colour. In Burmah they occur in association with rubies, but are much less numerous. They have also been recently found in Paldar, north of the Chandrabagha range. The sapphire is widely distributed through the gold-bearing drifts of Victoria and New South Wales, but the colour of the stones is usually too dark. Some of the finest specimens have come from the Beechworth district in Victoria. Coarse sapphire is found in many parts of the United States, and a few stones fit for jewellery have been obtained from Corundum Hill, Macon county, North Carolina, and from the other localities mentioned under RUBY. The sapphire also occurs in Europe, being found in the basalts of the Rhine valley and of Le Puy in Velay, but not sufficiently fine for purposes of ornament. The sapphire has been artificially reproduced by similar methods to those described in the article RUBY.

SAPPHO (in Attic Greek Σαπφώ, but called by herself Σάπφειρα, which is necessitated by the metre also in *Anthol.*, ix. 190, though Alcæus, himself an Æolian and her contemporary, calls her Σαπφώ), incomparably the greatest poetess the world has ever seen, was a native of Lesbos, and probably both was born and lived at Mytilene. For the idea that she migrated thither from Eresus is merely a conjecture to explain a perfectly imaginary difficulty caused by the grammarians who invented another Sappho, a courtesan of Eresus, to whom to ascribe the current scandals about the poetess. She was the daughter of Scamandronymus and Cleis, of whom nothing more is known. The epistle of Sappho to Phaon, ascribed to

Ovid, says that her "parent" died when she was six years old, if *Frag* 90 refers to Sappho's own mother, which is very doubtful, this "parent" must be her father. Her date cannot be certainly fixed, but she must have lived about the end of the 7th and beginning of the 6th centuries B.C., being contemporary with Alcaeus, Stesichorus, and Pittacus, in fact with the culminating period of Æolic poetry. But of her life very little else is known. One of her brothers, Charaxus, who was engaged in the wine-trade between Lesbos and Naucratis in Egypt, fell in love there with a courtesan named Doricha and surnamed for her beauty Rhodopis, whom he freed from slavery and upon whom he squandered his property. Sappho wrote an ode on this, in which she severely satirized and rebuked him. Another brother, Lanchus, was public cup-bearer at Mytilene,—a fact for which it was necessary to be *ἐπίκυρτος*, so that we may suppose Sappho to have been of good family. For the rest it is known that she had a daughter, named after her grandmother Cleis, and that she had some personal acquaintance with Alcaeus. He addressed her in an ode of which a fragment is preserved: "Violet-weaving, pure, sweet-smiling Sappho, I wish to say somewhat, but shame hinders me," and she answered in another ode: "Hadst thou had desue of aught good or fair, shame would not have touched thine eyes, but thou wouldst have spoken thereof openly." Further than this everything is enveloped in doubt and darkness. The well-known story of her love for the disdainful Phaon, and her leap into the sea from the Leucadian promontory, together with that of her flight from Mytilene to Sicily, which has been connected with her love for Phaon, rests upon no evidence that will bear examination. Indeed, we are not even told whether she died of the leap or not. All critics again are agreed that Suidas was simply gulled by the comic poets when he tells us of her imaginary husband, Cercolas of Andros. The name of Sappho was by these poets consistently dragged in the dirt, and both the aspersions they cast on her character and the embellishments with which they garnished her life passed for centuries as undoubted history. Six comedies entitled *Sappho*, and two *Phaon*, were produced by the Middle Comedy, and, when we consider, for example, the way in which Socrates was caricatured by Aristophanes, we are justified in putting no faith whatever in any accounts of Sappho which depend upon such authority, as most of our accounts appear to do.

Welcker¹ was the first to examine carefully the evidence upon which the current opinion of Sappho's character rested. He found it easy to disprove, in his opinion, all the common accusations against her moral character, but unfortunately, not content with disproving actual statements, went on to uphold Sappho as a model of feminine virtue. Bergk and Mure both combated his views, and in the *Rheinisches Museum* for 1857 may be found the issues between him and the latter clearly stated on both sides, unfortunately with considerable acrimony. It is plain to the impartial reader that both of the controversialists have gone decidedly too far, but it can hardly be denied, however much we should naturally desire to think otherwise, that Mure has very considerably the best of it. We owe thanks to Welcker for clearing the history of Sappho from several fictions, but further than this it is impossible to go, we owe thanks to Mure for preferring truth to sentiment, but we cannot disregard some points of Welcker's argument so completely as he does. In fact, the truth appears to be that Sappho was not, as the Attic comedy represented her, a woman utterly abandoned to vice, and only distinguished among the corrupt com-

munity of Lesbos by exceptional immorality and the gift of song,—that indeed she was not notoriously immoral at all, but no worse and perhaps better than the standard of her age and country required. This seems clearly indicated by the epithet *ἄγνα*, with which Alcaeus addressed her. On the other hand, not merely tradition but the character of her extant fragments, with the other evidence adduced by Mure, constrain us to resign the pleasant dream of Welcker, K. O. Muller, and their followers,—an ideal and eminently respectable head of a poetic school, with a matronly regard for her pupils, who meant by her own poems anything but what she said, and was more careful to inculcate virtue than unlimited indulgence in passion.

To leave this disagreeable question, we will next indicate briefly all that is known of her position in Lesbos. She was there the centre of a brilliant society and head of a great poetic school, for poetry in that age and place was cultivated as assiduously and apparently as successfully by women as by men. Her most famous pupils were Erinna of Telos and Damophyla of Pamphylia. Besides them we know the names of Attis, Telesippa, Megara, Gongyle, Gymnna, Dica, Mnasiada Eunice, and Anactoria, to whom the second ode, *eis ἱποκύβαντα*, is said to have been addressed. The names also of two of her rivals are preserved—Andromeda and Gongo; but whether they also presided over similar schools or not is very doubtful, as that idea of them depends on the authority of Maximus Tyrus, which is quite worthless on this point.

In antiquity the fame of Sappho rivalled that of Homer. She was called "the poetess," as he was called "the poet." Different writers style her "the tenth Muse," "the flower of the Graces," "a miracle," "the beautiful," the last epithet referring to her writings, not her person, which is said to have been small and dark. Her poems were arranged in nine books, on what principle is uncertain, she is said to have sung them to the Mixolydian mode, which she herself invented. The few remains which have come down to us amply testify to the justice of the praises lavished upon Sappho by the ancients. The perfection and finish of every line, the correspondence of sense and sound, the incomparable command over all the most delicate resources of verse, and the exquisite symmetry of the complete odes raise her into the very first rank of technical poetry at once, while her direct and fervent painting of passion, which caused Longinus to quote the ode to Anactoria as an example of the sublime, has never been since surpassed, and only approached by Catullus and in the *Vita Nuova*. Her fragments also bear witness to a profound feeling for the beauty of nature, we know from other sources that she had a peculiar delight in flowers, and especially in the rose. The ancients also attributed to her a considerable power in satire, but in hexameter verse they considered her inferior to her pupil Erinna.

The fragments of Sappho have been all preserved by other authors accidentally. An independent fragment, ascribed to her by Blass but rejected by Bergk and of very doubtful authenticity, has been discovered on a papyrus in the Egyptian museum at Berlin (see *Zeitsch. Mus.* for 1880, p. 287; Bergk, vol. iii. p. 704); but even if really hers it is too fragmentary to be of any value. The best edition of Sappho is to be found in Bergk's *Poetæ Lyrici Græci*, vol. iii, 4th ed., Leipzig, 1852. The only separate edition and the only complete translation in English is that of Mr. Wharton (London, 1888), in which it is unfortunately impossible for the general reader to place much reliance.

(J. A. FL.)

SARABAND (Ital. *Sarabanda*, *Zarabanda*, Fr. *Sarabande*), a slow dance, generally believed to have been imported from Spain in the earlier half of the 16th century, though attempts have sometimes been made to trace it to an Eastern origin. The etymology of the word is very uncertain. The most probable account is that the dance was named after its inventor—a celebrated dancer

¹ Sappho von einem herrschenden Vorurtheil befreit, Göttingen, 1816.

of Seville, called Zarabanda. During the 16th and 17th centuries the saraband was exceedingly popular, alike in Spain, France, Italy, and England. Its music was in triple time—generally with three minims in the bar—and almost always consisted of two strains, each beginning upon the first beat, and most frequently ending on the second or third. Many very fine examples of it will be found among the *Suites* and *Puritas* of Handel and J. S. Bach, but by far the finest we possess is that which Handel first composed for his overture to *Alcina*, and afterwards adapted to the words "Lascia, ch'io pianga," in *Rinaldo*.

SARACENS was the current designation among the Christians of Europe in the Middle Ages for their Moslem enemies, especially for the Moslems in Europe. In earlier times the name of *Saraceni* was applied by Greeks and Romans to the troublesome nomad Arabs of the Syro-Arabian desert who continually harassed the frontier of the empire from Egypt to the Euphrates. It is easy to understand how, after Islam, the name came to be extended to the Moslem enemies of the empire in general, but no satisfactory explanation has been given of the reason why the Romans called the frontier tribes Saraceni. It is most natural to suppose that they adopted some name of a tribe or confederation and used it in an extended sense, just as the Syrians called all these northern nomads by the name of the tribe of *Tayy*. The common derivation from the Arabic *sharīf*, "eastern," is quite untenable. Springer suggests that the word may be simply *shorālā*, "allies."

SARAGOSSA See ZARAGOZA.

SARAKHS See PERSIA, vol. xviii p. 618.

SARÁN, or **SARUN**, a British district in the lieutenant-governorship of Bengal, lying between 25° 40' and 26° 38' N. lat. and 83° 58' and 85° 14' E. long. It forms one of the north-western districts of the Patná division in the Behar province, and comprises an area of 2622 square miles. Sarán is bounded on the north by the district of Gorakhpur in the North-Western Provinces, on the east by the Bengal districts of Champáran and Tirhut, on the south by the Ganges, separating it from Shikhabád and Patná districts, and on the west by Gorakhpur. It is a vast alluvial plain, possessing no mountains, and scarcely any hill or even undulations, but with a general inclination towards the south-east, as indicated by the flow of the rivers in that direction. The rivers and watercourses are very numerous, few tracts being better supplied in this respect. The principal rivers besides the Ganges are the Gandak and Ghagrá, which are navigable throughout the year. There is little or no waste land, and the district has long been noted for the high state of its cultivation. Sarán is beautifully wooded, mango trees are very numerous, and it yields large crops of rice, besides other cereals, tobacco, opium, indigo, cotton, and sugar-cane. Though possessing no railways or canals, the district is well provided with roads. There is very little jungle, large game is not met with, but snakes are very numerous. Sarán is subject to blight, flood, and drought, its average annual rainfall is 45 inches. The administrative headquarters are at Chhapra.

The census of 1881 returned the population at 2,280,382 (1,083,665 males and 1,196,517 females), Hindus numbered 2,010,958, Mohammedans 269,142, and Christians 282. The population is entirely agricultural, there are only three towns with more than 10,000 inhabitants, viz., Chhapra (51,670), Sevan (13,319), and Revelgánj (12,493). Manufactures are few and of little account, the principal are indigo, sugar, brass-work, pottery, saltpetre, and cloth. The commerce of Sarán consists chiefly in the export of raw produce, of which the chief articles are oil-seeds, indigo, sugar, and grain of all sorts except rice, the imports consist principally of rice, salt, and European piece-goods. Revelgánj is the chief trading mart. The gross revenue of the district in 1883-84 amounted to £203,734, of which the land contributed £122,612. Sarán formerly

constituted one district with Champáran. The revenue areas of the two districts were not finally separated until 1866, but the managerial jurisdictions were first divided in 1837.

SARAPIS See SERAPIS.

SARATOFF, a government of south-eastern Russia, on the right bank of the lower Volga, having Penza and Simbirsk on the north, Samara and Astrakhan on the east, and the Don Cossacks, Voronezh, and Tamboff on the west. The area is 32,624 square miles, and the population (1882) 2,113,077. The government has an irregular shape, and a narrow strip, 140 miles long and from 20 to 45 miles wide, extending along the Volga as far south as its Sarepta bend, separates from the river the territory of the Don Cossacks. Saratoff occupies the eastern part of the great central plateau of Russia, which gently slopes towards the south so as unperceptibly to merge into the steppe region, its eastern slope, deeply cut into by ravines, abruptly falls towards the Volga. As the higher parts of the plateau range from 700 to 900 feet above the sea, while the Volga flows at an elevation of only 20 feet at Khvatynsk in the north, and is 48 feet beneath sea-level at Sarepta, the steep ravine-cut slopes of the plateau give a hilly aspect to the banks of the river. In the south, and especially in the narrow strip above mentioned, the country assumes the characteristics of true elevated steppes, intersected with waterless ravines.

Every geological formation from the Carboniferous up to the Miocene is represented in Saratoff, the older ones are, however, mostly concealed under the Cretaceous, whose fossiliferous marls, flint-bearing clays, and iron-bearing sandstones cover broad areas. The Jurassic deposits seldom make their appearance from beneath them. Eocene sands, sandstones, and marls, rich in marine fossils and in fossil wood, extend over large tracts in the east. The boulder-clay of the Finland and Olonetz ice-sheet penetrates in Saratoff as far south-east as the valleys of the Medveditsa and the Sura, while extensive layers of loess and other deposits of the Lacustrine or Post-Glacial period appear in the south-east and elsewhere above the Glacial deposits. Iron-ore is abundant; chalk, lime, and white pottery clay are extracted to a limited degree. The mineral waters at Sarepta, formerly much visited, have been superseded in public favour by those of Caucasus.

Saratoff is well watered, especially in the north. The Volga, from 1 to 7 miles in width, separates it from Samara and Astrakhan for a length of 500 miles, its tributaries are but small, except the Sura, which rises in Saratoff and serves for the northward transit of timber. The tributaries of the Don are more important; the upper Medveditsa and the Khoper, which both have a southward course parallel to the Volga and water Saratoff each for about 200 miles, are navigated notwithstanding their shallows, ready-made boats being brought in separate pieces from the Volga for that purpose. The Ilcvla, which flows in the same direction into the Don, is separated from the Volga only by a strip of land 15 miles wide, Peter I. proposed to utilize it as a channel for connecting the Don with the Volga, but the idea was never carried out, and the two rivers are now connected by the railway (52 miles) from Tsaritsyn to Kalatch which crosses the southern extremity of Saratoff.

Lakes and marshes occur only in a few river-valleys. The region is rapidly drying up, and the forests diminishing. In the south, about Tsaritsyn, where the hills were almost wholly disappeared in a few centuries ago, they have more than a third of the surface, the aggregate area under wood being reckoned at 2,661,000 acres. The remainder is distributed as follows—arable land, 11,509,000 acres, prairies and pasture lands, 3,799,000, uncultivable,

2,049,800 Such is the scarcity of timber that the peasants' houses are made of clay, the corner posts and door and window frames being largely shipped from the wooded districts of the middle Volga. The climate is severe and quite continental. The average yearly temperatures are $41^{\circ} 5$ at Saratoff (January, $12^{\circ} 3$; July, $71^{\circ} 5$) and $44^{\circ} 4$ at Tsaritsyn (January, $13^{\circ} 3$; July, $74^{\circ} 6$). The average range of temperature is as much as 119° . The Volga is frozen for an average of 162 days at Saratoff and 153 days at Tsaritsyn. The soil is very fertile, especially in the north, where a thick sheet of black-earth covers the plateaus, sandy clay and salt clay appear in the south.

The population is very various, emigrants from all parts of Russia being mixed with Finnish and Tartar stems and with German colonists. The Great Russians constitute 75 per cent of the population, Little Russians 7 per cent, Germans 7, Moldavians 6, and Tartars 3 1/2 per cent. The Tatars may number about 11,000, Mescheraks about 3000, and Poles about 5000. All are unequally distributed, Little Russians being more numerous in the districts of Atkarsk, Batashoff, Tsaritsyn, and Kamyshin (18 to 13 per cent), the Moldavians in Kuznetsk and Petrovsk (16 per cent), and the Germans in Kamyshin (40 per cent). The immigration of the Germans took place in 1703-1705, and their wealthy colonies have the aspect of minor West-European towns (see SARATOFF).

Only 235,140 of the population reside in ten towns, the remainder (1,827,637) being distributed over 5602 villages, of which some have from 5000 to 12,000 inhabitants, and no less than 150 or more than 2000. The annual mortality is 42 per 1000 (1882), but this high figure is more than compensated for by the births, which in the same year were 51 per 1000. The chief occupation is agriculture. More than one half of the arable land (6,210,000 acres) was under crops in 1881. In 1884 the returns were rye, 3,374,000 quarters (1,608,300 in 1883), wheat, 350,700, barley, 103,400, oats, 1,637,700 (2,432,700 in 1883), and various, 764,400. Drought, and sometimes also noxious insects, cause great fluctuations in the harvest, but nevertheless almost every season leaves a considerable balance of corn for export. Oil-yielding plants are also cultivated. In all districts around Saratoff and Tsaritsyn, mustard, both for grain and oil, extensively about Serepta and in the Kamyshin district, and sunflower (140,000 quarters) in the northern districts. Gardening is a considerable source of income around Saratoff, Volsk, Atkarsk, and Kamyshin. The *motolins* disperse have great plantations of water-melons, melons, pumpkins, &c. The peasants of Saratoff are no better off than those of the other governments of central Russia (see SARATOFF). Years of scarcity are common, and invariably mean ruin for the peasants. Cattle-breeding, formerly a large source of income, is rapidly falling off. Between 1877 and 1882 there was a decrease of 271,000 head, and murrain swept away large numbers of cattle in 1883.

Manufactures are developing but slowly, the chief of them, those dealing with animal produce, being checked by the falling off in cattle-breeding. The 6500 industrial manufacturing establishments of Saratoff employed an aggregate of only 17,500 workmen, with an annual production of but 20,373,500 roubles ($\pounds 2,097,350$) in 1882. The most considerable were—cottons, $\pounds 217,200$, woollen cloth, $\pounds 64,480$, tanneries, $\pounds 85,830$, tallow, soap, wax-candles, flour, $\pounds 21,217,800$, oils, $\pounds 125,360$, distilleries, $\pounds 255,780$, iron, $\pounds 15,390$, and machinery, $\pounds 237,195$. Various petty trades are rapidly developing among the peasantry, sheep-rearing is carried on in the Volga villages, woollen vessels and implements are made in the north, and pottery in several villages; and quite recently the fabrication of lead-pencils has been added at Butyrinovka. Very many peasants have still every year to leave their homes in search of work on the Volga and elsewhere. An active trade is carried on by the merchants of the chief towns—corn, hides, tallow, oils, being exported, the merchants of Saratoff, moreover, acting as intermediaries in the trade of south-east Russia with the adjacent provinces. The chief ports are Saratoff, Tsaritsyn, Kamyshin, and Khvalynsk.

Saratoff is divided into 10 districts, the chief towns of which and their populations in 1882 were as follows—Saratoff (112,430 inhabitants), Atkarsk (7610), Batashoff (10,090), Kamyshin (14,460), Khvalynsk (17,860), Kuznetsk (17,930), Petrovsk (16,020), Serdobsk (10,860), Tsaritsyn (31,220), and Volsk or Volysk (34,980). The German colony Serepta, which has not yet attained municipal institutions, is a lively little town with 5650 inhabitants, which carries on an active trade in mustard, woollen cloth, and various manufactured wares. Dubovka (13,450 inhabitants) derives its importance from its traffic with the Don, the villages Samotlovka in the district of Batashoff and Kotofay in Volsk have each more than 11,000 inhabitants, Balanda and Arkadak are important grain-markets.

The district Samotlovka has been inhabited since at least the Neolithic Period, its inhabitants of a later epoch have left numerous bronze remains in the *kurgans*, but the question of their ethnological position is still unsettled. In the 8th and 9th centuries the half-

nomad Butasses peopled the territory and recognized the authority of the Khazar princes. Whether the Butasses were the ancestors of the Moldavians—as some ethnologists are inclined to admit—has not yet been determined. At the time of the Mongolian invasion, the Tartars took possession of the territory, and one of their settlements around the Khan's palace at Trek, 10 miles from Saratoff, seems to have had some importance, as well as those about Tsaritsyn and Dubovka. The incursions of the Crimean Tartars devastated the country about the 15th century, and after the fall of Kazan and Astrakhan the territory was annexed to Moscow. Saratoff and Tsaritsyn, both protected by forts, arose in the second half of the 16th century, but the forests and deep ravines of the territory continued for two centuries more to give shelter to numerous bands of squatters, Raskolniks, and runaway serfs, who did not recognize the authority of Moscow, they sometimes robbed the caravans of boats on the Volga and were ready to support the insurrections both of Razin and of the impostors of the 18th century. Dmitrievsk (now Kamyshin) and Petrovsk were founded about the end of the 17th century, and a palisaded wall was erected between the Volga and the Don, while other lines of military posts were kept in the north and west. A special "voisko" of Volga Cossacks was founded in 1731, but as they also joined the rebellions they were soon transferred to the Teisel. Regular colonization may be said to have begun only at the end of the 18th century, when Catherine II called back the runaway dissenters, invited German colonists, and ordered her courtiers to settle here their serfs, deported from Russia. In that year the population of the lieutenantancy, which extended also along the left bank of the Volga, reached 640,000 in 1777. It exceeded one million in 1817. In 1851 the territory on the left bank of the Volga was transferred to the new Samara government. (P A K)

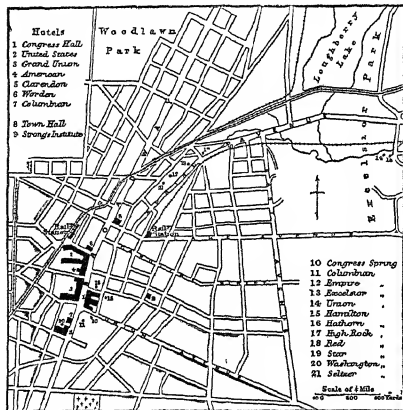

SARATOFF, capital of the above government, situated on the right bank of the Volga, 532 miles by rail to the south-east of Moscow, has become one of the most important cities of eastern Russia, and ranks among the very few Russian cities which have more than 100,000 inhabitants. It is picturesquely situated on the side of hills which close down to the Volga. One of these, the Sokolova Hill (560 feet) is liable to frequent landslides, which are a continual source of danger to the houses of poorer inhabitants at its base. The terrace on which Saratoff is built being intersected by two ravines, the city is divided into three parts, the outer two may be considered as suburbs. A large village, Pokrovskaya, with about 20,000 inhabitants, situated on the opposite bank of the Volga, though in the government of Samara, is in reality a suburb of Saratoff. Apart from this suburb, Saratoff had in 1882 a population of 112,430 (49,660 in 1830, and 69,660 in 1859). It is better built than many towns of central Russia. Its old cathedral (1697) is a very plain structure, but the new one, completed in 1825, is fine, and has a striking campanile. The theatre and the railway station are also fine buildings. The streets are wide and regular, and there are several broad squares. A new fine-art gallery was erected in 1884 by the Russian painter Bogolouboff, who has bequeathed to the city his collection of modern pictures and of various objects of art. A school of drawing and the public library are in the same building, which has received the name of "Radstcheff's Museum" (in memory of Radstcheff, the author prosecuted by Catherine II.).

Agriculture and gardening are still the support of a section of the population, who rent land in the neighbourhood of the city. The culture of the sunflower deserves special mention. The local manufacturing establishments do not keep pace with the rapidly increasing trade, and their aggregate production cannot be estimated at more than $\pounds 450,000$. The distilleries are first in importance, next come the manufactures of liquors ($\pounds 160,000$), flour-mills (about $\pounds 20,000$), oil-works ($\pounds 55,000$), and tobacco-factories (about $\pounds 40,000$). The city has not only a trade in corn, oil, hides, tallow, woollen cloth, wool, furs, and various raw produce exported from Samara, but also a trade in salt from Crimea and Astrakhan, which is in the hands of the Samara merchants, and in iron from the Urals and woollen wares from the upper Volga governments. Saratoff also supplies south-eastern Russia with manufactured articles and grocery wares imported from central Russia. The traffic of the port was estimated at 1,570,000 roubles in 1887. The shallowness of the Volga opposite the town, and the immense shoals along its right bank are, however, a great drawback. Vast sand-banks, which formerly lay above the city, have gradually shifted their position, and it is supposed that in a

few years Saratoff will be situated on a shoal about 1 mile wide in 1882 and 1883 steamers were compelled to discharge caigoes 50 miles below Saratoff or at the Pokrovskaya suburb on the left bank;—so that a branch railway for conveying the caigoes of the steamers has now been constructed south of the city.

The town of Saratoff was founded at the end of the 16th century, on the left bank of the Volga, some seven miles above the present site, to which it was removed about 1605. The place it now occupies (Sarytau, or Yellow Mountain) has been inhabited from a remote antiquity. Although founded for the maintenance of order in the Volga region, Saratoff, which was not fortified, was several times pillaged in the 17th and 18th centuries. Razin took it, and his followers kept it until 1671, the misnamed Cossacks of the Don under Buturkin and Nekrasov pillaged it in 1708 and Pugachev in 1774. After being placed under Kazan and later under Astrakhan, it became the chief town of the Saratoff government in 1797.

SARATOGA SPRINGS, a village of the United States, whose mineral waters, apart from any charm of situation, have rendered it one of the most fashionable of summer resorts. It lies in the east of Saratoga county, New York, 186 miles by rail north of New York city, on a level plateau in the valley of the Hudson, not far from the junction of this river with the stream discharging from Saratoga Lake. The number and size of its hotels (some of which are among the largest in the world and can accommodate upwards of 1000 guests) and the large influx of wealthy and fashionable visitors, bringing its

Plan of Saratoga Springs

population up to 30,000, render Saratoga Springs anything rather than a "village." Its resident inhabitants even numbered 8421 in 1880 and the township contained 10,820. There are Presbyterians, Baptists, Methodist, Episcopal, and Roman Catholic churches, a large town-hall, a high school and other educational institutions, a fire department building, a circular railway, and numerous private mansions. Congress Park was laid out in 1875-6. In July and August the racecourse of the Saratoga Racing Association attracts the best patronage of the American turf.

The Indians seem at an early date to have known of the medicinal virtues of the High Rock Spring, and in 1767 Sir William Johnson, carried thither by a party of Mohawks, was restored to health by drinking its waters. General Schuyler cut a road through the forest from Schuylerville, and in 1784 erected the first frame house in the neighbourhood of the springs. Hotels began to be built about 1815. New springs have from time to time been discovered, and their number has also been increased by boring; so that now there are 28 in all. They rise in a stratum of Potsdam sandstone undelained by Laurentian gneiss, &c., and reach the surface by passing through a bed of blue clay. All are charged with carbonic acid gas. The following are among the most notable

—Congress Spring in Congress Park, discovered in 1792 (chloride of sodium, bicarbonates of lime and magnesium), Washington or Champagne Spring (1806), Columbian Spring (1806), Hathorn Spring (1868), Pavilion Spring (1839), Putnam Spring, Geyser Spring (bored in 1870 to a depth of 140 feet and spouting 25 feet into the air), Glacier, spouting spring (bored in 1871 to 300 feet), Flat Rock Spring, known as early as 1774, but lost, and only recovered in 1884. The water from several of the springs is largely bottled and exported. The Geyser Spring ($1\frac{1}{2}$ miles S W) and White Sulphur Spring and Eureka Spring ($1\frac{1}{2}$ miles E) are beyond the limits of the accompanying plan.

SARAWAK, a territory in the north-west of Borneo, which, reclaimed from piracy and barbarism by the energy of Sir James Brooke (*qv*), was converted into an independent and prosperous state. With an area estimated at from 35,000 to 40,000 square miles, it has a population of about 250,000. The coast extends from Tanjung Datu, a prominent cape in $2^{\circ} 3' N$ lat., northwards to the frontier of Brunei in $3^{\circ} 10'$ —a distance in a straight line of about 280 miles, but, following the sinuosities, about 400 miles. Inland the boundaries towards the Dutch territory are hypothetically determined by the line of watershed between the streams flowing north-west and those flowing east-south-east and south-west, but the frontier districts are to a considerable extent unexplored. Towards the coast there are tracts of low alluvial land, and some of the rivers reach the sea by deltas out of all proportion to the length of their course. The surface of the country soon, however, begins to rise and to be diversified with irregular hills, sometimes of rounded sandstone, sometimes of picturesque and rugged limestone. The Bongo Hills, in the residency of Sarawak, are about 3000 feet high, and along the frontier, where the Seraung Mountains, the Kinkong Mountains, the Batang Lupar Mountains, &c., are supposed to form more or less continuous ranges, there are altitudes of from 4000 to 8000 feet. In some of the limestone mountains there are caves of enormous extent (a detailed account will be found in Boyle, *Adventures among the Dyaks of Borneo*, 1865). The Rejang is the largest river in Sarawak. Its sources are only 120 or 130 miles directly inland near Mount Lawu, Mount Mauid (8000 feet), and Gura Peak, but it flows obliquely south-west for 350 miles, and the principal branches of its delta (the Eyan river and the Rejang proper) embrace a territory of 1600 square miles with a coast-line of 60 miles. In their upper course the headwaters have a rapid descent, and none of them are navigable above Balih where the Rejang is deflected westward by the accession of the Balih river. Left-hand tributaries from a low line of hills to the south—the Katibas, Nymah, Kanowit, and Kajulan rivers—continue to swell the main stream, but there are no tributaries of any importance from the right hand, the country in that direction being drained directly seawards by a number of short rivers—the Oya, Mukah, Balnean, Tatan, and Buntulu,—of which the first three rise in the Ulat-Bulu Hills (3600 feet). At the apex of the Rejang delta lies the village and government of Sibn, and at the mouth of the Rejang branch is the important village and shipping-port of Rejang. Passing over the small river basins of the Kaluhak and the Saribas we reach the Batang Lupar, which ranks next to the Rejang, and is navigable for large vessels as far as Lunga, about 30 miles from its mouth—the bar having $3\frac{1}{2}$ fathoms water at high tide. The value of the navigable portion of the Batang Lupar is, however, greatly lessened by the formidable bores to which it is subject, they begin about three days before full moon and change, and last about three days, rushing up the river with a crest about 6 feet high for a distance of 60 miles. In several of the other rivers a similar phenomenon is observed. The broad mouth of the Batang Lupar opens in the angle where the coast, which has run nearly north and south from the delta of the Rejang, turns

abruptly west, and all the rivers which reach the sea between this point and Tanjung Datu—the Sadong, the Samarahan, the Sarawak (with its tributaries the Seime, the Samban, the Poak, &c.), the Lundu, are short

The mineral wealth of Sarawak is not unimportant. Gold washing has long been carried on in the central residence, though not with more than moderate success, and more recently a fairly prolific gold-field has been opened in the neighbourhood of Marau, on the Batang Lupat, where there is a flourishing Chinese settlement. Of much greater value are the antimony ores which occur more especially in the district of the headstreams of the Sarawak, in the most various localities, occasionally as dykes *in situ*, but more frequently in boulders deep in the clay soil, or perched on tower-like summits and craggy pinnacles, accessible only by ladders. These rich deposits have, however, been largely exhausted, and no new ones have been discovered in other parts of the territory, so that the Borneo Company (which has the monopoly of this and other minerals in the country) has been tempted to erect local furnaces to reduce the poorer qualities of ore and the refuse of the mines to regulus on the spot. A deposit of cinnabar was discovered by Mr Helms in 1807, at Tegaya, at the foot of the Bongo Mountains, but no other occurrence of this ore of quicksilver in the territory has yet been reported. In 1876 quicksilver was exported to the value of 103,050 dollars, and in 1879 to 76,620. Coal has been worked for many years at the government mines of Samunjun, on the banks of a right-hand affluent of the Sadong, and there is known to exist at Silantek up the Langga river (a left-hand affluent of the Batang Lupat) a very extensive coal-field, whose products, still intact, could be brought down for shipment at Langga by a railway of some 18 miles in length. Diamonds have been discovered, but not in paying quantities.

Like the rest of Borneo, Sarawak is largely covered with forest and jungle. The bilian or ironwood is not only used locally but exported, especially from the Batang Lupat district, to China, where it is highly valued as a house-building and furniture timber. Gutta-percha, india-rubber (*gutta-seria*), and birds' nests are also exported, but in diminishing quantities, and their place is being taken by gambier and pepper, the cultivation of which was introduced by the rajah. The figures are at 30,461 piculs in the exports of 1881, and at 29,432 in 1884, and pepper at 28,807 piculs in 1881 and 48,490 in 1884. The territory of Sarawak is said to furnish more than half the soap produce of the world, and most of it is grown on the marshy banks of the Oya, Mukah, and other rivers of the northern residence of Sarawak to the distance of about 20 miles inland. The total value of the exports of Sarawak in 1884 was 1,145,248 dollars (1,071,528 from Kuching), that of the imports 1,038,295 dollars. Chinese and Dutch vessels are the most numerous in the shipping returns.

The government is an absolute monarchy—the present rajah being the nephew of Sir James Brooke. The rajah is assisted by a supreme council of six, consisting of two chief European residents and four natives, nominated by himself, there is also a general council of fifty, which meets once every three years or oftener if required. For administrative purposes the country is divided into eight districts corresponding to the number of principal river basins. Three chief districts are presided over by European officers. The military force—some 250 men—is under the control of an English commandant. There is also a small police force, and the Government possesses a few small steam vessels. The civil service is regularly organized, with pensions, &c. The revenue is in a satisfactory state, showing 64,899 dollars to the good in the period between 1875 and 1884. In 1884 the revenue was 276,269 dollars and the expenditure 236,291. Residents and Protestants both have missions in Sarawak, and the English bishop of Singapore and Labuan is also styled bishop of Sarawak. The population consists of Malays, Chinese, Land Dyaks, Sea Dyaks, and Melanows. "Without the Chinaman," says the rajah (*Pail Mail Gazette*, 19th September, 1888) "we can do nothing." When not allowed to form secret societies he is easily governed, and this he is forbidden to do on pain of death. The Dyaks within the territory have given up head-hunting. The Melanows, who live in the northern districts both have adopted the Malay dress and in many cases have become Moham medans, they are a quiet, contented, and laborious people. Slavery still prevails in Sarawak, but arrangements are made for its entire abolition in 1888. Kuching, the capital of Sarawak, on the Sarawak river, is a place of 12,000 inhabitants and is steadily growing.

History.—In 1839–40 Sarawak, the most southern province of the sultanate of Brunei, was in rebellion against the tyranny of the governor, Panglima Sani, and a Mr. Muds Henson had been sent to restore order. The insurgents held out at Balidah or Bidah fort in the Sumanan district, and there James Brooke first took part in the affairs of the territory. By his assistance the insurrection was suppressed, and on September 24th he was appointed chief of Sarawak. In 1843 Captain Keppel and Mr Brooke expelled the pirates

from the Saribas river and in 1844 they defeated those on the Batang Lupat, to whom Mahkota had attached himself. In 1849 another severe blow was struck by the destruction of Srib Sahlin's fort at Patusan. The Chinese, who had begun to settle in the country about 1850 (at Bau, Bidah, &c.), made a violent attempt to massacre the English and seize the government, but they were promptly and severely crushed after they had done harm at Kuching. During Sir James Brooke's absence in England (1857–1860) his nephew Captain J. Johnson (who had tal in the name Brooke, and is generally called Captain Brooke) was left in authority, but a quarrel afterwards ensued and Sir James Brooke was in 1868 succeeded by Charles Johnson (or Brooke), a younger nephew. The independence of Sarawak had been recognized after much controversy by England in 1863 and previously by the United States.

See Charles Brooke, *Ten Years in Sarawak*, 1866. Gustave L. Jacob, *The Days of Sarawak*, 1876. Spencer St. John, *Life in the Forests of the Far East*, 1862, and *Life of Sir James Brooke*, 1879. Ulrich, *Pioneering in the Far East*, 1882. "Notes on Sarawak," in *Proc. Roy. Geogr. Soc.*, 1881, by W. H. Gueda.

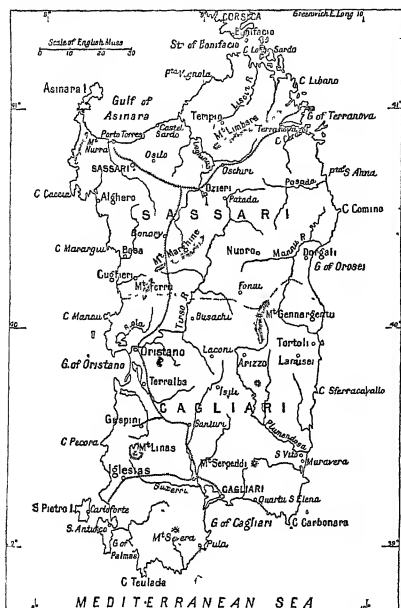

SARDANAPALUS was, according to the account of Ctesias (preserved by Diodorus, 23 *sq.*), the last king of Ninereh, and he is described in terms that have made his name proverbial as the type of splendid and luxurious effemacy. Ctesias's story cannot be called historical, but the name Sardanapalus seems to be a corruption of Assurbampal (see vol. II. p. 188).

SARDINE (*Clupea pilchardus*) See PILCHARD. Another of the *Clupeidae* (*C. scobrinnii*) is the "oil-sardine" of the eastern coast of the Indian Peninsula.

SARDINIA (Ital. *Sardegna*, Fr. *Sardaigne*, Span. *Cerdeña*, called by the ancient Greeks Ἰχθυόρα, from a fancied resemblance to the print of a foot), an island in the Mediterranean, about 140 miles from the west coast of Italy, of which kingdom it forms a part. It is separated from the island of Corsica by the Strait of Bonifacio, which is about 7½ miles wide, and only about 50 fathoms deep. Sardinia lies between 8° 4' and 9° 49' E. long., and extends from 38° 55' to 41° 16' N. lat. The length from Cape Teulada in the south-west to Cape Longo Sardo in the north is about 160 miles, the breadth from Cape Comino to Cape Caccia about 68 miles. The area of the island is 9187 square miles,—that of the department (*compartimento*), including the small islands adjacent, being 9294 square miles. It ranks sixth in point of size among the islands of Europe, coming next after Sicily.

The greater part of the island is mountainous, especially in the east, where the mountains stretch almost continuously from north to south, and advance close up to the coast. The elevations, however, are not so high as in the sister island of Corsica. The culminating point is Monte Gennargentu, which rises, about 22 miles from the east coast, almost exactly on the parallel of 40° N., to the height of 6250 feet, and is consequently little more than two-thirds of the height of the chief peaks of Corsica. On the east side the principal breach in the continuity of the mountains occurs in the north, where a narrow valley opening to the east at the Gulf of Terranova cuts off the mountains of Limpara in the extreme north-east. The western half of the island has more level land. The principal plain, that of the Campidano, stretches from south-east to north-west, between the Gulf of Cagliari and that of Oristano, and nowhere attains a greater elevation than 250 feet. At both ends it sinks to a much lower level, and has a number of shallow lagoons encroaching on it from the sea. In the corner of the island situated to the south-west of the Campidano there are two small isolated mountains rising to the height of from 3000 to 4000 feet, which are of importance as containing the chief mineral wealth of the island. A small valley runs between them from the southern end of the Campidano to Iglesias, the mining centre of Sardinia. North of the Gulf of Oristano mountains again appear. The extinct volcano of Monte Ferru there rises to the height of 4400 feet, and the streams of basalt which have issued from it in former

ages form the ridge or saddle, about 2000 feet high, connecting this mountain with the highland area on the east. Still further north a trachytic plateau, intersected by numerous deep river valleys, occupies a considerable tract, advancing up to the plain of Sassari on the north coast.

Map of Sardinia

The rivers are numerous but short. The principal is the Oristano, which enters the gulf of the same name on the west coast.

Geologically the island is composed mainly of granite and other crystalline rocks. Granite predominates especially in the east, and the mountains of that part of the island were apparently at one time continuous with the similarly constituted mountains of Corsica. Granitic spurs likewise extend to the south-west, and appear in the capes of Spartivento and Tenella. Altogether this rock is estimated to cover one-half of the entire surface. In the west of the island the principal crystalline rocks are porphyritic in structure, sedimentary deposits are comparatively unimportant, and such as are present are mainly either of very ancient or of recent geological date. Silurian formations attain their most considerable development in the south-west round Iglesias, where there occurred the contemporaneous porphyritic outpourings containing the most numerous mineral veins of the island. Between the deposits of Silurian and those of Cretaceous times there are none of any consequence except a few patches of Devonian round the slopes of Gennargentu, interesting as containing some beds of true coal. The members of the Cretaceous system occupy considerable tracts in the south-west, east (round the Gulf of Orosen), and north-west (in the mountains of Nurra), and a smaller area in the south-west (in the island of San Antico). Tertiary formations are still more largely developed. They cover the whole

plain of the Campidano, the west coast opposite the island of San Antico, and the narrow valley in the north-east already mentioned. The basalts of Monte Ferru are also of Tertiary date, and it does not appear to have been till that epoch that Sardinia formed a single island.

In variety of mineral wealth the southern half of Sardinia is the richest province of Italy, and it stands second in the annual value of its mineral products. The chief minerals are sulphates of lead more or less argentiferous (galena), sulphates and silicates of zinc, ordinary iron pyrites, sulphates of iron and copper, of antimony, and of arsenic, besides cobalt, nickel, and silver. The coal on the flanks of Gennargentu is of good enough quality to furnish a valuable fuel, and is found in sufficiently thick seams to be workable if only the means of transport were present, but its situation is such as to render it of no economical importance. In the Tertiary deposits of the south-west there are some veins of manganese ore, and also some beds of lignite which are worked as a source of fuel for local use. The mineral wealth of Sardinia was known in ancient times, and mines were worked both by the Carthaginians and the Romans. During the Middle Ages they were for the most part neglected, but the industry was revived in modern times, and has been greatly developed in recent years. Upwards of 70 mines have now been opened, most of them in the district of which Iglesias is the centre, but a few near the southern part of the east coast, where Muravera is the chief town. The mines are mostly of argentiferous lead, silver, zinc, and iron. The ores are mainly exported in the raw state, only the inferior sorts being smelted in the island. Among other mineral products are building stones (granite, marble, &c.), alabaster, and salt.

The climate of Sardinia is similar to that of the rest of the Mediterranean region, and the southern half of the island shares in the nearly rainless summers characteristic of the southern portions of the Mediterranean peninsulas. At Cagliari there are on an average only seven days on which rain falls during June, July, and August. Throughout the island these months are the driest in the year, and hence vegetation on the lower ground at least is generally at a standstill during that period, and shrubs with broad leathery leaves fitted to withstand the drought (the so-called *maquis*) are as characteristic here as in Corsica and on the mainland. Winter is the rainiest season of the year, but the heat and drought of summer (mean temperature 95° F.) make that the most unpleasant of the seasons, while in the low grounds the prevalence of malaria renders it a most unhealthy one, especially for visitors. Autumn, which is prolonged into December, is the most agreeable season, there is then neither heat nor cold, nor mist nor fever, and at that period birds of passage begin to immigrate in large numbers.

The agricultural products of the island are greatly inferior to what might be expected in view of the natural fertility of the soil. Two causes are assigned for this. The first is the minute subdivision of the land, which, as in Corsica, is carried to such an extent that where an owner has as much as 100 acres his property is divided into 25 or 30 lots surrounded by parcels of land belonging to other owners. In such circumstances it is neither possible to apply adequate capital to the cultivation of the ground, nor for the owners to acquire the requisite capital. The second cause is the malaria which renders certain districts possessed of a fertile soil quite uninhabitable, and this second cause can be remedied only when a remedy has been found for the first, for, as the malaria is undoubtedly one cause of diminished cultivation, it is equally certain that want of cultivation is one of the causes of the malaria. In ancient times Sardinia was one of the granaries of Rome, now cereals take a comparatively unimportant place among the exports, and this export is balanced by a considerable import of the same commodity. The chief products of agriculture are wheat, barley, and beans, the last furnishing an important element of the food of the people. Olives run wild in many places, and are grown in sufficient abundance to meet the local demand.

Almonds, oranges and citrons are also largely cultivated, and the oranges of San Vito, near Muravera, and of Milis, a few miles to the north of Oristano, are noted for their excellence, the white wines of the banks of the Oristano are of good repute, and among other products of the island are mulberries, tobacco, madder, and hemp. Forests of oak, cork-oak, fir, and pines, though greatly reduced in extent, still cover, it is said, about one-fifth of the surface. The rearing of live-stock receives more attention than agriculture proper. No artificial pasture-grasses are grown, but the natural pastures beside the numerous rivers yield abundance of food, except during the dry season, when the horses, asses, cattle, sheep, and goats have to content themselves with straw, some dried beans, and a little barley. Most attention is bestowed on horses. At one time the Sardinian Government endeavored to keep a stud on the island for rearing horses for the Piedmontese cavalry, but the persons employed (natives of the mainland) were unable to withstand the malaria. There are some large private establishments for the rearing of horses, however, and the tending of live-stock generally forms so important a part of the occupations of the people that animals rank next after minerals among the exports of the island. Of the wild animals the wild sheep known as the mutton, or European mouflon, formerly an inhabitant of all the mountains of the Mediterranean peninsula and islands, and now confined to Sardinia and Corsica, is the most interesting. Among the noxious animals are scorpions and tarantulas.

The lagoons near the coast on the south and west abound in mullets, eels, mussels, and other shell-fish, and in great numbers by the natives, while the fisheries round Sarinaria, as round Corsica, are in the hands of Italians from the mainland. The anchovy, sardine, and coal fisheries are all lucrative. The coal is said to be of excellent quality, and is exported to the markets of Genoa and Marseilles.

The external commerce of the island has nearly trebled itself in the twenty-five years 1858-81, the imports and exports each amounting in the latter year to about £1,500,000 (about £2,48 per head of population). This increase is chiefly owing to the development of the mining industry, ores making up nearly one-third of the total value of the exports. Live animals make up about a fourth of the total value, and cereals, which come next in order, about one-seventh. The chief imports are cotton and other manufactures and colonial products. The inland trade has been greatly promoted within the last fifty years by the construction of roads and railways. Before 1828 there were no roads at all on the island, the tracks which existed could be traversed only on foot or on horseback. But upwards of 1500 miles of national and provincial roads, all well made and well kept, have since then been constructed. Of railways, introduced since 1870, there are now 265 miles in all (equal to about 1 mile of railway for every 84 square miles of surface).

For administrative purposes Sardinia, like the rest of Italy, is divided into provinces and circles (*circondari*). The following table gives the names of these divisions with the population according to the last census (end of 1881) —

Circles	Communes	Population	Circles	Communes	Population
Cagliari	79	113,326	Sassari	24	88,812
Iglesias	24	77,378	Alghero	20	45,624
Lauria	48	64,816	Oristano	20	87,768
Oristano	106	125,110	Osseri	21	41,193
			Tempio	9	26,444
Prov Cagliari	287	420,688	Prov Sassari	107	261,867

The whole population of the department is thus 682,002, equal to about 74 to the square mile, Sardinia being the least populous of all the great divisions of the kingdom, in which the average density is 255 to the square mile. The population is increasing at a rather more rapid rate than on the mainland. Between 1871 and 1881 it increased by about 46,000, or 7.18 per cent, while the average rate of increase throughout the kingdom was only 6.16 per cent.

The inhabitants of Sardinia are a hardy race, of about middle height, and of dark complexion. They are little accustomed to hard work, but this is one of the consequences of the backward state of their civilization and of the impediments already indicated to the development of the resources of the island. Education, as in many other parts of Italy, is very far behind, notwithstanding the law which makes elementary education compulsory, but here, as throughout the kingdom, it is rapidly extending. In 1880-81 only 87,197 children, or less than one-eighteenth of the population, were in attendance at the elementary schools, but this number was double what it has been in 1861-62. At Cagliari there is a university, attended by from 800 to 400 students.

The people are lively in their disposition, fond of music and poetry, remarkably hospitable, and strong in their family attachments. With this last trait, however, is connected the chief blot on their character—their addiction to the practice of the *vendetta*, which prevails here as in Corsica, and according to which an

outrage on one's honor is wiped out in blood, and the cause of one member of a family is taken up by the rest, so that the death of one victim leads to the sacrifice of many others. But the practice is said to be becoming every day more rare, and never to be resorted to except in case of serious offence.

The capital of the island is Cagliari, but Sassari in the north has an equally large population (about 84,000). The other chief towns are Tempio, Alghero, Iglesias, and Oristano. Cagliari, Alghero, and Castel Sardo are fortified.

The antiquities of the island are numerous and of peculiar interest. The most remarkable are the monuments called *nuraghi* (usually spelled also *nuraghe*, *nuraghi*, &c.), of which there are upwards of 3000 scattered over the island. They are round structures having the form of truncated cones, and are generally built of the hardest materials the island supplies (granite, basalt, trachyte, limestone, &c.). The stone is roughly hewn into large blocks, which are laid in regular horizontal courses but not cemented. The blocks in the lower courses are sometimes more than three feet in length. Entrance is obtained by a very low opening at the base to an inner chamber, and, when there are two or three, as in some cases, three stories, these are connected by means of a spiral staircase. The origin and use of these structures are both matters of speculation. The rarity of human remains in them is against the idea that they were used as tombs, while the absence of any relics pertaining to a religious ceremonial is equally adverse to the supposition that they were used as temples. Next to the *nuraghi* (the most interesting of the remains of antiquity are the so-called tombs of the giants, which cover the island), naturally used as places of burial, although, as the name given to them indicates, their dimensions are greatly in excess of those of the human body. Besides these there are tombs the structure of which leads to the belief that they must be relics of an Egyptian colony.

History.—According to Prof Crespi, of the university of Cagliari, the tombs just referred to are not the only signs of an early Egyptian settlement in the island of Sardinia. Various remains are said to prove beyond doubt that the Egyptians have founded at least two colonies in very remote times—one at the ancient town of Tharros on the small peninsula of San Marco at the northern extremity of the Gulf of Oristano, and the other at Cagliari, the present Cagliari. But even before the Egyptians Prof Crespi believes that the Phœnicians had established a colony on the small island of San Anteocho, and had built there the town of S'Anteocho, the ruins of which are some of the most important of San Anteocho. Of Phœnicians and Egyptians, however, there are no trustworthy historical records, and the first settlers whose arrival is historically accredited were the Carthaginians, who succeeded in making themselves masters of the island under Hasdrubal in 512 B.C. The island remained in Carthaginian hands for upwards of two hundred and seventy years, and then passed into those of the Romans, who took advantage of the fever in which Carthage was involved with her mercenary troops after the close of the First Punic War to seize the island (238 B.C.). Thereafter the island remained in possession of the Romans till near the fall of the empire of the West, when Sardinia also began to suffer from the ravages of the northern hordes by which Italy was at that time overrun and the empire of the West overthrown. About the middle of the 6th century the island was occupied by the Vandals under Genseric, but in the first half of the following century these were expelled by Belisarius. Very soon after, however, Goths succeeded the Vandals, and after these had in turn been driven out by Narses the natives managed to expel the Romans and to achieve their independence (655). The Sardinians thereupon elected the leader in the revolt against Rome king of the island, and by him the island was divided into the four grand-principalities of Cagliari, Arborea, Torres, and Gallura. The grand-justices or rulers of these four principalities were to retain a considerable amount of power during a large part of the Middle Ages. But from the early part of the 8th century down to the middle of the 11th their influence was greatly impaired by repeated invasions of the Saracens, who landed now on one coast now on another, and kept the inhabitants in a constant state of alarm. This state of matters was at last put an end to by the Genoese and Pisans, who, acting under the sanction of the pope, despatched a fleet against that of the Saracens. A battle ensued in the Bay of Cagliari, the Saracens were completely defeated, and the allies landed on the island (1050). Very soon the Pisans adroitly managed to rid themselves of the Genoese, and to gain possession of almost the entire island, disposing the grand-justices of Cagliari, Torres, and Gallura. With the Pisans the greater part of the island remained till 1325, when the pope gave Sardinia to the king of Aragon, who combined with the grand-justice of Arborea to drive out the former rulers. But this being accomplished, war soon broke out between the two, and numerous successes were gained by the grand-justice Marian IV and his daughter Eleonora acting as regent on behalf of her son Marian V, a minor. The Aragonese seemed to be on the point of being driven out of the island when Eleonora died of

the plague (1403), and soon after the whole island became an Aragonese (after the union of the crowns of Aragon and Castile a Spanish) province. It remained Spanish till the treaty of Utrecht in 1713, when it was ceded to the house of Austria, by which in 1720 it was handed over to Victor Amadeus II, duke of Savoy, in exchange for the island of Sicily. Shortly before the date of this acquisition the duke of Savoy (see SAVOY) had had the title of king conferred upon him, and when the cession of Sardinia took place the title was changed to that of king of Sardinia. With this kingdom the island ultimately became merged in the kingdom of Italy.

See La Marmora, *Voyage en Sardaigne* (Paris, 24 vol., 1837-57); Roussier de Bellet, *La Sardaigne et la Corse* (Paris, 1855); Robert Tennant, *Sardinian and its Islands* (London, 1937).

SARDIS (cf. Σάρδεις), the capital of the kingdom of Lydia, the seat of a *coventus* under the Roman empire, and the metropolis of the province Lydia in later Roman and Byzantine times, was situated in the middle Hermus valley, at the foot of Mount Tmolus, a steep and lofty spur of which formed the citadel. It was about 20 stadia (2½ miles) south of the Hermus. The earliest reference to Sardis is in the *Persæ* of Æschylus (473 B.C.), in the *Iliad* the name Hyde seems to be given to the city of the Mæonian (i.e. Lydian) chiefs, and in later times Hyde was said to be the older name of Sardis, or the name of its citadel. It is, however, more probable that Sardis was not the original capital of the Mæonians, but that it became so amid the changes which produced a powerful Lydian empire in the 8th century B.C. The city, but not the citadel, was destroyed by the Cimmerians in the 7th century, by the Athenians in the 6th, and by Antiochus the Great in the 3d century, once at least, under the emperor Tiberius, it was destroyed by an earthquake, but it was always rebuilt, and continued to be one of the great cities of western Asia Minor till the later Byzantine time. Its importance was due, first to its military strength, secondly to its situation on an important highway leading from the interior to the Ægean coast, and thirdly to its commanding the wide and fertile plain of the Hermus. The early Lydian kingdom was far advanced in the industrial arts (see LYDIA), and Sardis was the chief seat of its manufactures. The most important of these trades was the manufacture and dyeing of delicate woollen stuffs and carpets. The statement that the little stream Pactolus which flowed through the market-place rolled over golden sands is probably little more than a metaphor, due to the wealth of the city to which the Greeks of the 6th century B.C. resorted for supplies of gold, but trade and the practical organization of commerce were the real sources of this wealth. After Constantinople became the capital of the East a new road system grew up connecting the provinces with the capital. Sardis then lay rather apart from the great lines of communication and lost some of its importance. It still, however, retained its titular supremacy, and continued to be the seat of the metropolitan bishop of the province. It is enumerated as third, after Ephesus and Smyrna, in the list of cities of the Thracian theme given by Constantine Porphyrogenitus in the 10th century; but in the actual history of the next four centuries it plays a part very inferior to Magnesia ad Sipylum and Philadelphia, which have to the present day retained their pre-eminence in the district. The Hermus valley began to suffer from the inroads of the Seljuk Turks about the end of the 11th century, but the successes of the Greek general Phocas in 1118 relieved the district for the time, and the ability of the Comneni, together with the gradual decay of the Seljuk power, retained it in the Byzantine dominions. The country round Sardis was frequently ravaged both by Christians and by Greeks during the 13th century. Soon after 1301 the Seljuk emirs overran the whole of the Hermus and Cayster valleys, and a fort on the citadel of Sardis was handed over to them by treaty. Finally in 1390 Philadelphia, which

had for some time been an independent Christian city, surrendered to Sultan Bayazid's mixed army of Ottoman Turks and Byzantine Christians, and the Seljuk power in the Hermus valley was merged in the Ottoman empire. The latest reference to the city of Sardis relates its capture (and probable destruction) by Timur in 1402. Its site is now absolutely deserted, except that a tiny village, Sart, merely a few huts inhabited by semi-nomadic Yuruks, exists beside the Pactolus, and that there is a station of the Smyrna and Cassaba Railway a mile north of the principal ruins.

The ruins of Sardis, so far as they are now visible, are chiefly of the Roman time, but probably few ancient sites would more richly reward the excavator with remains of all periods from the early pre-Hellenic time downwards. On the banks of the Pactolus two columns of a temple of the Greek period, probably the great temple of Cylbele, are still standing. More than one attempt to excavate this temple, the last by Mr G. Dennis in 1882, have been made and piecemeal brought to an end by lack of funds. The necropolis of the old Lydian city, a vast series of mounds, some of enormous size, lies on the north side of the Hermus, four or five miles from Sardis, a little south of the sacred lake Coloe, here the Mæonian chiefs, sons, according to Homer, of the lake, were brought to sleep beside their mother. The series of mounds is now called *Bin Tepe* (Thousand Mounds). Several of them have been opened by modern excavators, but in every case it was found that treasure-seekers of an earlier time had removed any articles of value that had been deposited in the sepulchral chambers.

SARDONYX, a name applied to those varieties of onyx, or stratified chalcedony, which exhibit white layers alternating with others of red or brown colour. The brown chalcedony is known to modern mineralogists as *sard* and the red as *carnelian*. The simplest and commonest type of sardonyx contains two strata,—a thin layer of white chalcedony resting upon a ground of either carnelian or sard, but the sardonyx of ancient writers generally presented three layers—a superficial stratum of red, an intermediate band of white, and a base of dark brown chalcedony. The sardonyx has always been a favourite stone with the cameo-engraver, and the finest works have usually been executed on stones of five strata. Such, for instance, is the famous Carpegna cameo, in the Vatican, representing the triumph of Bacchus and Ceres, and reputed to be the largest work of its kind ever executed (16 inches by 12). When the component layers of a sardonyx are of fine colour and sharply defined, the stone is known in trade as an "Oriental sardonyx"—a term which is used without reference to the geographical source whence the stone is obtained. A famous ancient locality for sard was in Babylonia, and the name of the stone appears to be connected with the Persian word *seved*, "yellowish red," in allusion to the colour of the sard. Pliny, relying on a superficial resemblance, derives the name from Sardis, reputed to be its original locality. The sardonyx is frequently stained, or at least its colour heightened, by chemical processes. Imitations are fabricated by cementing two or three layers of chalcedony together, and so building up a sardonyx, while baser counterfeits are formed simply of paste. See ONYX, vol. xvi p. 776.

SARI See MAZANDARÁN.

SARMATIANS (Σαρματῆς, Σαρμάται, Sarmatæ). In the time of Herodotus (iv. 110-117) the steppes between the Don and the Caspian were inhabited by the Sarmatæ, a nomadic horse-riding people, whose women rode, hunted, and took part in battle like the men, so that legend (presumably the legend of the Greek colonists on the Black Sea) represented the race as descendants of the Amazons by Scythian fathers. It is recounted both by Herodotus

and by Hippocrates (*De Aer*, 17) that no maiden was allowed to marry till she had slain a foe (or three foes), after which she laid aside her masculine habits. The Scythians, we are told, called the Amazon *Olímpara*, which seems to be an Iranian name and to mean "lords of man," and it is reasonable to think that the word was applied to the Sarmatian viragos by the Scythians, who themselves kept women in great subjection, and thus expressed their surprise at the dominating position of the female sex among their neighbours beyond the Don. But in spite of the difference of their customs in this point Scythians and Sarmatians spoke almost the same language (Herod iv 117), and, whatever difficulty still remains as to the race of the Scythians, their language and religion are now generally held to have been of Iranian character (see ΣΥΡΤΗΙΑ). That the Sarmatians, at least, were of Median origin is the express opinion of Diodorus (ii. 43) and Pliny. From their seats east of the Danube the Sarmatians at a later date moved westward into the lands formerly Scythian, one branch, the "transplanted" *Iazyges* (1 *μετανασταύ*) being settled between the Danube and the Theiss at the time of the Dacian wars of Rome, while other Sarmatian tribes, such as the Maiores on the eastern shores of Lake Maeotis and the Roxolani between the Don and the Dnieper, ranged over the steppes of southern Russia. The country of Sarmatia, however, as that term is used for example by Ptolemy, means much more than the lands of the Sarmatians, comprising all the eastern European plain from the Vistula and the Dniester to the Volga, whether inhabited by nomad Sarmatians, by agricultural Slavs and Letts, or even by Finns. This Sarmatia was arbitrarily divided into an Asiatic and a European part, east and west of the Don respectively.

SARNO, a city of Italy, in the province of Salerno, 30 miles east of Naples by rail, lies at the foot of the Apennines near the sources of the Sarno, a stream connected by canal with Pompeii and the sea. Besides the cathedral, a basilica erected in 1625 at some distance from the city, Sarno has several interesting churches and the ruins of a mediæval castle. Paper, cotton, silk, linen, and hemp are manufactured. The population of the town in 1881 was 11,445. Previous to its incorporation with the domains of the crown of Naples, Sarno gave its name to a countship held in succession by the Orsini, Cappola, Suttavilla, and Colonna families.

SARPI, PIETRO (1552-1623), was born at Venice, August 14, 1552, and was the son of a small trader, who left him an orphan at an early age. Quiet, serious, devoted to study, endowed with great tenacity of application and a prodigious memory, the boy seemed born for a monastic life, and, notwithstanding the opposition of his relatives, entered the order of the Servi di Maria, a minor Augustinian congregation of Florentine origin, at the age of thirteen. He assumed the name of Paolo, by which, with the epithet *Servita*, he was always known to his contemporaries. In 1570 he sustained no fewer than three hundred and eighteen theses at a disputation in Mantua, with such applause that the duke attached the youthful divine to his service by making him court theologian. Sarpi spent four years at Mantua, applying himself with the utmost zeal to mathematics and the Oriental languages. He there made the acquaintance of Olivo, formerly secretary to a papal legate at the council of Trent, from whom he learned much that he subsequently introduced into his *History*. After leaving Mantua for some unexplained reason, he repaired to Milan, where he enjoyed the protection of Cardinal Borromeo, another authority in the council, but was soon transferred by his superiors to Venice, as professor of philosophy at the Servite convent. In 1579 he was sent to Rome on business connected with

the reform of his order, which occupied him several years, and brought him into intimate relations with three successive popes, as well as the grand inquisitor and other persons of influence. The impression which the papal court made upon him may be collected from his subsequent history. Having successfully terminated the affairs entrusted to him, he returned to Venice in 1588, and passed the next seventeen years in quiet study, occasionally interrupted by the part he was compelled to take in the internal disputes of his community. In 1601 he was recommended by the Venetian senate for the small bishopric of Caorle, but the papal nuncio, who wished to obtain it for a protégé of his own, informed the pope that Sarpi denied the immortality of the soul, and had controverted the authority of Aristotle. An attempt to procure another small bishopric in the following year also failed, Clement VIII. professing to have taken umbrage at Sarpi's extensive correspondence with learned heretics, but more probably determined to thwart the desires of the liberal rulers of Venice. The sense of injury, no doubt, contributed to exasperate Sarpi's feelings towards the court of Rome, but a man whose master passions were freedom of thought and love of country could not have played any other part than he did in the great contest which was impending. For the time, however, he tranquilly pursued his studies, writing those notes on Vieta which establish his proficiency in mathematics, and a metaphysical treatise now lost, which, if Foscarini's account of it may be relied upon, anticipated the sensationalism of Locke. His anatomical pursuits probably date from a somewhat earlier period. They illustrate his versatility and thirst for knowledge, but are far from possessing the importance ascribed to them by the affection of his disciples. His claim to have anticipated Harvey's discovery rests on no better authority than a memorandum, probably copied from Cesalpini's; or Harvey himself, with whom, as well as with Bacon and Gilbert, he maintained a correspondence. The only physiological discovery which can be safely attributed to him is that of the contractility of the iris. It must be remembered, however, that his treatises on scientific subjects are lost, and only known from imperfect abstracts.

The prudent Clement died in March 1605, and after one ephemeral succession and two very long conclaves Paul V. assumed the tiara with the resolution to strain papal prerogative to the uttermost. At the same time Venice was adopting measures to restrict it still further. The right of the secular tribunals to take cognizance of the offences of ecclesiastics had been asserted in two remarkable cases, and the scope of two ancient laws of the city of Venice, forbidding the foundation of churches or ecclesiastical congregations without the consent of the state, and the acquisition of property by priests or religious bodies, had been extended over the entire territory of the republic. In January 1606 the papal nuncio delivered a brief demanding the unconditional submission of the Venetians. The senate having promised protection to all ecclesiastics who should in this emergency aid the republic by their counsel, Sarpi presented a memoir, pointing out that the threatened censures might be met in two ways,—*de facto*, by prohibiting their publication, and *de jure*, by an appeal to a general council. The document was received with universal applause, and Sarpi was immediately made canonist and theological counsellor to the republic. When in the following April the last hopes of accommodation were dispelled by Paul's excommunication of the Venetians and his attempt to lay their dominions under an interdict, Sarpi entered with the utmost energy into the controversy. He prudently began by republishing the anti-papal opinions of the famous

canonist Gerson. In an anonymous tract published shortly afterwards (*Risposta di un Dottore in Teologia*) he laid down principles which struck at the very root of the pope's authority in secular things. This book was promptly put upon the *Index*, and the republication of Gerson was attacked by Bellarmino with a severity which obliged Sarpi to reply in an *Apologia*. The *Considerazioni sulle Censure* and the *Trattato dell' Interdetto*, the latter partly prepared under his direction by other theologians, speedily followed. Numerous other pamphlets appeared, inspired or controlled by Sarpi, who had received the further appointment of censor over all that should be written at Venice in defence of the republic. His activity registers the progress of mankind, and forms an epoch in the history of free discussion. Never before in a religious controversy had the appeal been made so exclusively to reason and history, never before had an ecclesiastic of his eminence maintained the subjection of the clergy to the state, and disputed the pope's right to employ spiritual censures, except under restrictions which virtually abrogated it. In so doing he merely gave expression to the convictions which had long been silently forming in the breasts of enlightened men, and this, even more than his learning and acuteness as a disputant, insured him a moral victory. Material arguments were no longer at the pope's disposal. The Venetian clergy, a few religious orders excepted, disregarded the interdict, and discharged their functions as usual. The Catholic powers refused to be drawn into the quarrel. At length (April 1607) a compromise was arranged through the mediation of the king of France, which, while saving over the pope's dignity, conceded the points at issue. The great victory, however, was not so much the defeat of the papal pretensions as the demonstration that interdicts and excommunications had lost their force. Even this was not wholly satisfactory to Sarpi, who longed for the toleration of Protestant worship in Venice, and had hoped for a separation from Rome and the establishment of a Venetian free church by which the decrees of the council of Trent would have been rejected, and in which the Bible would have been an open book. But the controversy had not lasted long enough to prepare men's minds for so bold a measure. The republic rewarded her champion with the further distinction of state counsellor in jurisprudence, and, a unique mark of confidence, the liberty of access to the state archives. These honours exasperated his adversaries to the uttermost, and after citations and blandishments had equally failed to bring him to Rome he began to receive intimations that a stroke against him was preparing in that quarter. On October 5 he was attacked by a band of assassins and left for dead, but the wounds were not mortal. The bravos found a refuge in the papal territories. Their chief, Poma, declared that he had been moved to attempt the murder by his zeal for religion, a degree of piety and self-sacrifice which seems incredible in a bankrupt oil-merchant. "Agnosco stylium Curæ Romanæ," Sarpi himself pleasantly said, when his surgeon commented upon the jagged and inartistic character of the wounds, and the justice of the observation is as incontestable as its wit. The only question can be as to the degree of complicity of Pope Paul V., a good man according to his light, but who must have looked upon Sarpi as a revolved subject, and who would find casuists enough to assure him that a prince is justified in punishing rebels by assassins when they are beyond the reach of executioners.

The remainder of Sarpi's life was spent peacefully in his cloister, though plots against him continued to be formed, and he occasionally spoke of taking refuge in England. When not engaged in framing state papers, he

devoted himself to scientific studies, and found time for the composition of several works. A Machiavellian tract on the fundamental maxims of Venetian policy (*Opinione come debba governarsi la repubblica da Venetia*), used by his adversaries to blacken his memory, though a contemporary production, is undoubtedly not his. It has been attributed to a certain Gradenigo. Nor did he complete a reply which he had been ordered to prepare to the *Squintino della Libertà Veneta*, which he perhaps found unanswerable. In 1610 appeared his *History of Ecclesiastical Benefices*, "in which," says Ricci, "he purged the church of the defilement introduced by spurious decretals." In the following year he assailed another abuse by his treatise on the right of asylum claimed for churches, which was immediately placed on the *Index*. In 1615 a dispute between the Venetian Government and the Inquisition respecting the prohibition of a book led him to write on the history and procedure of the Venetian Inquisition, and in 1619 his chief literary work, the *History of the Council of Trent*, was printed at London under the name of Pietro Soave Polano, an anagram of Paolo Sarpi Veneto. The editor, Marco Antonio de Dominis, has been accused of falsifying the text, but a comparison with a MS corrected by Sarpi himself shows that the alterations are both unnecessary and unimportant. This memorable book, together with the rival and apologetic history by Cardinal Pallavicini, is minutely criticized by Ranke (*History of the Popes*, appendix No. 3), who tests the veracity of both writers by examining the use they have respectively made of their MS materials. The result is not highly favourable to either, nor wholly unfavourable, neither can be taxed with deliberate falsification, but both have coloured and suppressed. They write as advocates rather than historians. Each had access to sources of information denied to the other, so that, although it may be true in a sense that the truth lies between them, it cannot be attained by taking the middle way between their statements. Ranke rates the literary qualities of Sarpi's work very highly. "Sarpi is acute, penetrating, and sarcastic; his arrangement is exceedingly skilful, his style pure and unaffected. In power of description he is without doubt entitled to the second place among the modern historians of Italy. I rank him immediately after Machiavelli." Sarpi never acknowledged his authorship, and baffled all the efforts of the Prince de Condé to extract the secret from him. He survived the publication four years, dying on January 15, 1623, labouring for his country to the last. The day before his death he had dictated three replies to questions on affairs of state, and his last words were "Esto perpetua." His posthumous *History of the Interdict* was printed at Venice the year after his death, with the disguised imprint of Lyons.

Sarpi's services to mankind are now acknowledged by all except the most extreme Ultramontane partisans, and of his general character it is enough to say that even theological hatred has been unable to fix the least personal imputation upon him. To the highest qualities of the scholar, the statesman, and the patriot he added charity, magnanimity, and disinterestedness. The only point on which his conduct may be thought to require apology is the reserve in which he shunned his religious opinions. Great light has been thrown upon his real belief and the motives of his conduct by the letters of Christoph von Dohna, envoy of Christian, prince of Anhalt, to Venice, published by Moritz Ritter in the *Briefve und Acten zur Geschichte des dreissigjährigen Krieges*, vol. II (Munich, 1874). Sarpi told Dohna that he greatly disliked saying mass, and celebrated it as seldom as possible, but that he was compelled to do so, as he which otherwise was seen to admit the validity of the papal prohibition, and thus betray the cause of Venice. This supplies the key to his whole behaviour, he was a patriot first and a religious reformer afterwards. He was most anxious to obtain liberty of Protestant worship at Venice, but scarcely proceeded beyond good wishes, partly from prudence, partly from being "rooted" in what Diiodati described to Dohna as "the most dangerous maxim, that God does not regard externals so long as the mind and heart are right before

Him" "It is of little avail," adds Diodati, "to dispute with him, for all blows fall ineffectually upon the sweetness and maturity of affections and spirit which raise him above all high every emotion." Sarpi had another maxim, which he thus formulated to Duhna: "*La felicità non vien, non la si dà, non la si acquista*."

It must further be considered that, though Sarpi admired the English play-book, he was neither Anglican, Lutheran, nor Calvinist, and might have found it difficult to accommodate himself to any Protestant church. On the whole, the opinion of Le Courayer, "qu'il n'est ni Catholique en gros et quelque fois Protestant en détail," seems not altogether groundless, though it can no longer be accepted as a satisfactory summary up of the question. His discoveries in natural science have been overrated, but his scientific attainments must have been great. Galileo would not have wasted his time in corresponding with a man from whom he could learn nothing, and, though Sarpi did not, as has been asserted, invent the telescope, he immediately turned it to practical account by constructing a map of the moon.

Sarpi's life was written by his enthusiastic disciple, Father Fulgenzio Micromini, whose work does honour to his heart, but is both meagre and uncritical. Bianchi-Giovini's modern biography (1846) is greatly mixed up by digressions, but is on the whole the most extensive extant, though inferior in some respects to that by Miss Augusta Georgina Campbell (1869), a labour of love, enriched by numerous references to MSS. unknown to Bianchi-Giovini. The numerous misprints which disfigure the English edition of this work have been corrected in an Italian translation. P. A. Gallepp's *Fate del Pope and Fate del Pape* (1861) is in the main a mere abridgement of Bianchi-Giovini, but adds a spirited account of the conclusion of Paul V. The incidents of the creation dispute from day to day are related in the contemporary Italian published by the Vatican (Venezia, 1869). Guasto Fontana's *Storia della vita di Pietro Sarpi* (1867), a better life, is nevertheless unimportant for the letters of Sarpi contain, as Orsini's *Memorie storiche* (1760) is from the author's access to Sarpi's unpublished writings, afterwards unfortunately destroyed by fire. Foscarini's *Lettere di Letterati Letterati* is important on the same account. Sarpi's memoirs on state affairs remain in the Vatican archives. Portions of his correspondence have been printed at various times, and selected letters from him are of frequent occurrence in public libraries. The King's Library in the British Museum is in a valuable collection of tracts in the latest controversy, formed by Consul Smith. (R. G.)

SARRAZIN, JACQUES (1588-1660), French painter, born at Noyon in 1588, was a pupil of the father of Simon Guillain, but he went to Rome at an early age and worked there under a Frenchman named Anguile. Starting thus, Sarrazin speedily obtained employment from Cardinal Aldobrandini at Frascati, where he won the friendship of Domenichino, with whom he afterwards worked on the high altar of St Andrea della Valle. His return to Paris, where he married a niece of Simon Vouet's, was signalled by a series of successes which attracted the notice of Sublet des Noyers, who entrusted to him the work by which Sarrazin is best known, the decoration of the great portal and dome of the western façade of the interior court of the Louvre. The famous Caryatides of the attic show, especially in the way in which the shadows are made to tell as points of support, the profound and intelligent study of Michelangelo's art to which Sarrazin had devoted all the time he could spare from bread-winning whilst in Rome. He now executed many commissions from the queen and from all the chief personages of the day, devoted much time to painting, and was an active promoter of the foundation of the Academy. The mausoleum for the heart of the Prince de Condé in the Jesuit church of the Rue Saint Antoine was his last considerable work (see Lenoir, *Musée des Monuments Français*, v. 5), he died 3d December 1660, whilst it was in progress, and the crucifix of the altar was actually completed by one of his pupils named Gros.

SARSAPARILLA, a popular alterative remedy, prepared from the long fibrous roots of several species of the genus *Smilax*, indigenous to Central America, and extending from the southern and western coasts of Mexico in the north to Peru in the south. These plants grow in swampy forests seldom visited by European travellers, and, being dioecious and varying much in the form of leaf in different individuals, they are but imperfectly known to botanists, only two species having been identified as yet with any degree of certainty. These are *Smilax officinalis*, Kth., and *S. medica*, Schlecht. and Cham., which yield respectively the so-called "Jamaica" and the Mexican varieties. The introduction of sarsaparilla into European medicine dates from the middle of the 16th century. Monardes, a physi-

cian of Seville, records that it was brought to that city from New Spain about 1536-45, that a better sort soon afterwards came from Honduras, and that an excellent variety of a darker colour, and consisting of larger roots, was subsequently imported from Guayaquil. Sarsaparilla must have come into extensive use soon afterwards, for Gerard, about the close of the century, states that it was imported into England from Peru in great abundance.

When boiled in water the root affords a dark extractive matter, the exact nature of which has not been determined, the quantity of extract yielded by the root is used as a criterion of its quality. Boiling alcohol extracts from the root a neutral substance in the form of crystalline prisms, which crystallize in scales from boiling water. This body, which is named *parulin*, is allied to the saponin of quillaja bark, from which it differs in not exciting sneezing. The presence in the root of starch, resin, and oxalate of lime is revealed by the use of the microscope. Sarsaparilla is chiefly used in medicine in the form of decoction and fluid extract. It is regarded by many as a valuable alterative and diaphoretic in chronic rheumatism, syphilis, and various skin diseases, but by others as possessing little if any remedial value. It is frequently prescribed in combination with powerful medicines, such as iodide of potassium or bichloride of mercury.

The varieties of sarsaparilla met with in commerce at present are the following: Jamaica, Lima, Honduras, Guatemala, Guayaquil, and Mexican. Of these the first-named is the most highly esteemed, as yielding the largest amount of extract, viz., from 83 to 44 per cent., it is the only kind admitted into the British pharmacopoeia. On the Continent, and more especially in Italy, the varieties having a white starchy bark, like those of Honduras and Guatemala, are preferred. "Jamaica" sarsaparilla is not produced there, but derives its name from the fact that Jamaica was at one time the emporium for sarsaparilla, which was brought thither from the West Indies, Spain, and Peru. Sarsaparilla is grown to a small extent in Jamaica, and is occasionally exported thence to the London market in small quantities, but its orange colour and starchy bark are so different in appearance from the thin reddish-brown bark of the genuine drug, that it does not meet with a ready sale. The Jamaica sarsaparilla of trade is collected on the Cordilleras of the Maricao, in that part of the island of Pinarua which adjoins the Costa Rica. It is exported from Belize to the extent of about 10,000 lb annually. Guatemala sarsaparilla is very similar to that of Honduras, but has a more decided orange hue, and the bark shows a tendency to split off. Guayaquil sarsaparilla is obtained chiefly in the valley of Alausa, on the western side of the equatorial Andes. The roots are roughly packed in large bales and are not made into separate hanks, and the damp or wet state is often allowed to remain, the damp and portions of an angular but not square stem being frequently attached to the roots. The latter are slender, shrivelled, and nearly devoid of rootlets. This kind of sarsaparilla is collected on the eastern slope of the Mexican Andes throughout the year, and is the produce of *Smilax medica*, Schlecht. and Cham.

The collection of sarsaparilla root is a very tedious business, a single root takes an Indian half a day or sometimes even a day and a half to unearth. The roots extend horizontally in the ground on all sides for about 9 feet, and from these the earth has to be carefully scraped away and other roots cut through where such come across them. A plant four years old will yield 16 lb of fresh

root, and a well-grown one from 32 to 64 lb, but more than half the weight is lost in drying. The more slender roots are generally left, and the stem is cut down near to the ground, the crown of the root being covered with leaves and earth. Thus treated, the plant continues to grow, and roots may again be cut from it after the lapse of two years, but the yield will be smaller and the roots more slender and less starchy. In some varieties, as the Guayaquil and Mexican, the whole plant, including the stock, is pulled up. The Indians are guided in their selection of roots by the number of stems arising from the roots, by the thinness of the leaves, and the closeness with which the stem is beset with prickles.

In several species of *Sauale*, the roots become thickened here and there into large tuberculous swellings 4 to 6 inches long, and one or two inches in thickness. These tubers form a considerable article of trade in China, but are used to a limited extent only on the Continent, under the name of China root, although introduced into Europe about the same time as sa-sa-pailla. China root is obtained both in China and India from *Sauale glabra* and *S. lanceolata*, *Roxburghi*, and *S. Chinai*. A similar root is yielded by *S. pseudo-China*, L., and *S. tinctoria* in the United States from New Jersey southwards, by *S. balsamifera*, Kth., in the West Indies, and by *S. Japanea* and *S. yunnanica*, Griseb., and *S. Brasiliensis*, Sprung., in South America. All these are used as an alternative remedy in the localities where they grow. The amount of China root exported to Europe from Canton in 1872 was only 51,200 lb, although in the same year as much as 1,267,773 lb was exported from the city of Hankow to other Chinese ports. In 1882 Bombay imported from China 945 cwt of the root. The name of India root is given to the roots of *Homalium edocense*, E Br., an Aesculapiaceous plant indigenous to India. These roots are readily distinguished from those of true sa-sa-pailla by their loose cracked bark and by their odour and taste, recalling those of melilot.

SARTHE, a department of the north-west region of France, formed in 1790 out of the eastern part of Maine, 29 communes of Anjou, and portions of Perche. Situated between 47° 35' and 48° 30' N lat. and between 0° 25' W and 0° 55' E long, it is bounded N by the department of Orne, N E by Eure-et-Loir, E by Loir-et-Cher, S by Indre-et-Loire and Maine-et-Loire, and W by Mayenne. The Sarthe, a sub-tributary of the Loire, flows in a south-westerly direction through the department, and the Loir, which along with the Sarthe joins the Mayenne to form the Maine above Angers, traverses its southern borders. The general slope of the country is from north to south-west. While the highest point (on the boundary towards Orne) is 1115 feet, the lowest, where the Loir leaves the department, is only 65. The hills that separate the streams rise as they advance north-east into Perche, or north-west into what are magniloquently called the Alpes Mancelles (1080 feet high). The Sarthe flows past Le Mans and Sablé, receiving the Merdreaux and the Vègre from the right, and the Orne and the Huisne from the left. The Loir passes La Flèche, and along its chalky banks caves have been hollowed out which, like those along the Cher and the Loire, serve as dwelling-houses and stores. The mean annual temperature differs but slightly from that of Paris. There are in the year 145 days of rain (with 12 of snow), 56 of frost, 180 of fogs, 20 of hail, and 14 of storm. The rainfall is about 24 inches, or rather below the average for France.

Of a total surface of 1,533,760 acres, 932,655 acres in the department are meadow, 188,517 under wood, 190,176 in meadows and grass, 49,000 in moors, and 22,284 in vineyards. In 1881 the live stock comprised 61,400 horses, 6524 asses or mules, 182,195 cattle, 49,378 sheep (wool-clip 85 to 84 tons), 79,787 pigs, 24,369 goats, 12,898 hives (70 tons of honey, 21½ tons wax). Poultry (capons, geese, &c.), form one of the most remunerative products of the department, which sends yearly to Paris 250,000 fowls and 100,000 geese, and consumes or disposes of 1,000,000 eggs. The horses are, like those of Perche (*percherons*), famous for speed combined with strength. There are three distinct districts—the corn lands to the north of the Sarthe and the Huisne, the meadows, partly planted with pine, between those two streams and the Loir, and the wine-growing country to the south of the Loir. In 1883 the grain crop yielded 2,813,287 bushels of wheat, 951,039 of rye, 174,248 of barley, 2,317,760 of barley, 1,998,040 of oats, 30,880 of maize, and 69,850 of buckwheat, and there were 9,538,312 bushels of potatoes and 52,521 of beans, peas, &c., 81,654 tons of beetroot, 4784 tons of hemp, and 6 of flax. In 1884 cider was produced to the extent of 15,478,414 gallons (average quantity per annum in previous years 8,623,444 gallons), and wine to 4,347,184 gallons

(average quantity 3,883,380). Fodder was grown to the amount of 381,110 tons, and there were considerable supplies of chestnuts and hazel nuts—Château du Loir being the principal market for the former. From the forests, which consist mainly of oaks, with alders, chestnut-trees, pines, and beeches, material is drawn to the value of £140,000. The agriculture of the district has made great progress through the opening up of roads, improvements, draining, and irrigation. Besides mines of anthracite and coal (21,205 tons in 1882), iron-ore, marble, freestone, slate, millstones, clay, marl, lime, tuffeau (a kind of white chalky tuff), magnesite, and peat are all worked. The staple industry is the manufacture of horse-draws (3395 spindles, 100 looms, 490 bating power-looms). The cotton manufacture ranks next (5700 spindles, 155 looms, of which 100 are power-looms), while the woollen manufacture employs only 350 spindles and 161 looms. In the paper-mills 569 workmen are engaged, and the value of the paper and cardboard produced was £150,880 in 1881. Iron-foundries, copper and bell foundries, potteries, tile-works, glass-works and stained glass manufactories, cut-glass, engine and carriage factories, wire-gauge factories, flour-mills, and distilleries are also carried on, and altogether about 256 steam-engines, with 2180 horse-power are employed in those establishments. The commerce of the department is facilitated by 99 miles of navigable river (the Sarthe and the Loir), 250 miles of national roads, 6707 miles of other roads, and 352 miles of railway.

With its 438,917 inhabitants (1881) Sarthe has exactly the same average density of population in France. From 1801 to 1850, 821 to 1856 (455,070) the number was in the increase, but since that date there has been a decline. The department forms the diocese of Le Mans, has its court of appeal at Angers, and its university authorities at Caen, and constitutes part of the territory of the fourth *circonscription* with its headquarters at Le Mans. The four *arrondissements* are named from Le Mans, the chief town, La Flèche (9424 inhabitants), famous for its pyramidal military towers (6070 inhabitants), and St Calais (6000). There are 38 cantons and 887 communes. Sablé (6000 inhabitants) contains a castle built for Colbert by Blansat, and had by was the celebrated Benedictine abbey of Salsmes.

SARTI, GIUSEPPE (1729–1802), musical theorist and composer, was born at Faenza, Italy, December 1, 1729, educated—according to the best accounts—by Padre Martini, and appointed organist of the cathedral of Faenza before the completion of his nineteenth year. Resigning his appointment in 1750, Sarti devoted himself with ardour to the study of dramatic music, and in 1751 produced his first opera, *Pompeo*, with great success. His next works, *Il Rè Pastore*, *Médonte*, *Demofonte*, and *L'Olimpiade*, assumed him so brilliant a reputation that in 1753 King Frederick V of Denmark invited him to Copenhagen, with the appointments of hofkapellmeister and director of the opera. In 1765 he travelled to Italy for the purpose of engaging some new singers, and meanwhile the death of King Frederick put an end for the time to his engagement. He was recalled to Copenhagen in 1768, and for some years enjoyed an extraordinary amount of court favour, but, though he carefully abstained from politics, the disasters from which both court and country so cruelly suffered at this critical period gradually undermined his position, and in 1775 he was banished from Denmark in disgrace. During his residence in Copenhagen Sarti composed a great number of operas, most of which were fairly successful, though few survived the epoch of their production. On his return to Italy in 1775 he was appointed director of the Ospedaleto—the most important music school in Venice; this post, however, he relinquished in 1779, when, after severe competition, he was elected maestro di cappella at the cathedral of Milan. Here he exercised his true vocation,—composing, in addition to at least twenty of his most successful operas, a vast quantity of sacred music for the cathedral, and educating a number of clever pupils, the most distinguished of whom was Cherubini, who was never weary of singing his praises as the most accomplished musician and first teacher of the age.

In 1784 Sarti was invited by the empress Catherine II to St Petersburg. On his way thither he stopped at

¹ It was probably during this temporary suspension of duty that he made the attempt to establish himself in London, but failed to obtain a hearing at the King's Theatre.

Vienna, where the emperor Joseph II received him with marked favour, and where he made the acquaintance of Mozart. He reached St Petersburg in 1785, and at once took the direction of the opera, for which he composed many new pieces, besides some very striking sacred music, including a *Te Deum* for the victory at Otchakoff, in which he introduced the firing of real cannon. He remained in Russia seventeen years, but by the end of that time his health was so broken by the climate that he solicited permission to return. The empress and her successor Paul I had then been some time dead, but the emperor Alexander dismissed Sarti with all possible honour, and he quitted the country in 1802 with a liberal pension and letters of nobility granted to him by the empress Catherine. His most successful operas in Russia were *Armida* and *Olegia*, for the latter of which the empress herself wrote the libretto. Sarti did not live to reach Italy, but died at Berlin, July 28, 1802.

There can be no doubt that Chemnitz owed much of his stupendous learning to the judicious teaching of Sarti, who was an accomplished mathematician and physicist as well as a musician, and whose works, if they lack the impress of true genius, show extraordinary talent, and are marked throughout by faultless taste, combined with technical skill of the highest order.

SARTO, ANDREA DET. (1487-1531) This celebrated painter of the Florentine school was born in Gualfonda, Florence, in 1487, or perhaps 1486, his father Agnolo being a tailor (*sarto*)—hence the nickname by which the son is constantly designated. The family, though of no distinction, can be traced back into the 14th century. Vannucchi has constantly been given as the surname,—according to some modern writers, without any authority, but it seems rather difficult to accept this dictum. There were four other children of the marriage. In 1494 Andrea was put to work under a goldsmith. This occupation he disliked. He took to darning from his master's models, and was soon transferred to a skilful woodcarver and inferior painter named Gian Barile, with whom he remained until 1498. Barile, though a coarse-grained man enough, would not stand in the way of the advancement of his promising pupil, so he recommended him to Piero di Cosimo as draughtsman and colourist. Piero retained Andrea for some years, allowing him to study from the famous cartoons of Leonardo da Vinci and Michelangelo. Finally Andrea agreed with his friend Francia Bigio, who was somewhat his senior, that they would open a joint shop, at a date not precisely defined they took a lodging together in the Piazza del Grano. Their first work in partnership may probably have been the Baptism of Christ, done for the Florentine Compagnia dello Scalzo, a performance of no great merit, the beginning of a series, all the extant items of which are in monochrome chiaroscuro. Soon afterwards the partnership was dissolved. From 1509 to 1514 the brotherhood of the Servi employed Andrea, as well as Francia Bigio and Andrea Feltrim, the first-named undertaking in the portico of the Annunziata three frescos illustrating the life of the founder of the order, S. Filippo Benizzi. He executed them in a few months, being endowed by nature with remarkable readiness and certainty of hand, and unhesitating firmness in his work, although in the general mould of his mind he was timid and diffident. The subjects are the Saint Sharing his Cloak with a Leper, Cursing some Gamblers, and Restoring a Girl possessed with a Devil. The second and third works excel the first, and are impulsive and able performances. These paintings met with merited applause, and gained for their author the pre-eminent title "Andrea senza error" (Andrew the unerring),—the correctness of the contours being particularly admired. After these subjects the painter proceeded with two others—the Death of St Philip, and the

Children Cured by Touching his Garment,—all the five works being completed before the close of 1510. The youth of twenty-three was already in technique about the best fresco-painter of central Italy, barely rivalled by Raphael, who was the elder by four years. Michelangelo's Sixtine frescos were then only in a preliminary stage. Andrea always worked in the simplest, most typical, and most trying method of fresco—that of painting the thing once and for all, without any subsequent dry-touching. He now received many commissions. The brotherhood of the Servi engaged him to do two more frescos in the Annunziata at a higher price, he also painted, towards 1512, an Annunciation in the monastery of S. Gallo.

The "Tailor's Andrew" appears to have been an easy-going plebeian, to whom a modest position in life and scanty gains were no grievances. As an artist he must have known his own value, but he probably rested content in the sense of his superlative powers as an executant, and did not aspire to the rank of a great inventor or leader, for which, indeed, he had no vocation. He led a social sort of life among his compeers of the art, was intimate with the sculptor Rustici, and joined a jolly dining-club at his house named the Company of the Kettle, also a second club named the Trowel. At one time, Francia Bigio being then the chauman of the Kettle-men, Andrea recited, and is by some regarded as having composed, a comic epic, "The Battle of the Mice and Frogs"—a *techauffé*, as one may surmise, of the Greek *Batrachomyomachia*, popularly ascribed to Homer. He fell in love with Lucrezia (del Fede), wife of a hatter named Carlo Recanatani, the latter dying opportunely, the tailor's son married her on the 26th December 1512. She was a very handsome woman, and has come down to us treated with great suavity in many a picture of her lover-husband, who constantly painted her as a Madonna and otherwise, and even in painting other women he made them resemble Lucrezia in general type. She has been much less gently handled by Vasari and other biographers. Vasari, who was at one time a pupil of Andrea, describes her as faithless, jealous, overbearing, and vixenish with the apprentices. She lived to a great age, surviving her second husband 40 years.

By 1514 Andrea had finished his last two frescos in the court of the Servi, than which none of his works was more admired—the Nativity of the Virgin, which shows the influence of Leonardo, Domenico Ghirlandajo, and Fra Bartolommeo, in effective fusion, and the Procession of the Magi, intended as an amplification of a work by Baldovinetti, in this fresco is a portrait of Andrea himself. He also executed at some date a much-praised Head of Christ over the high altar. By November 1515 he had finished at the Scalzo the allegory of Justice, and the Baptist Preaching in the Desert,—followed in 1517 by John Baptizing, and other subjects. Before the end of 1516 a Pietà of his composition, and afterwards a Madonna, were sent to the French Court. These were received with applause, and the art-loving monarch Francis I suggested in 1518 that Andrea should come to Paris. He journeyed thither towards June of that year, along with his pupil Andrea Squazzella, leaving his wife in Florence, and was very cordially received, and for the first and only time in his life was handsomely remunerated. Lucrezia, however, wrote urging his return to Italy. The king assented, but only on the understanding that his absence from France was to be short, and he entrusted Andrea with a sum of money to be expended in purchasing works of art for his royal patron. The temptation of having a goodly amount of pelf in hand proved too much for Andrea's virtue. He spent the king's money and some of his own in building a house for himself in Flor-

ence. This necessarily brought him into bad odour with Francis, who refused to be appeased by some endeavours which the painter afterwards made to reingratiate himself. No serious punishment, however, and apparently no grave loss of professional reputation befell the defaulter.

In 1520 he resumed work in Florence, and executed the Faith and Charity in the cloister of Lo Scalzo. These were succeeded by the Dance of the Daughter of Herodias, the Beholding of the Baptist, the Presentation of his Head to Herod, an allegory of Hope, the Apparition of the Angel to Zacharias (1523), and the monochrome of the Visitation. This last was painted in the autumn of 1524, after Andrea had returned from Luco in Mugello,—to which place an outbreak of plague in Florence had driven him, his wife, his step-daughter, and other relatives. In 1525 he painted the very famous fresco named the Madonna del Sacco, a lunette in the cloisters of the Servi, this picture (named after a sack against which Joseph is represented propped) is generally accounted his masterpiece. His final work at Lo Scalzo, 1526, was the Birth of the Baptist, executed with some enhanced elevation of style after Andrea had been diligently studying Michelangelo's figures in the sacristy of S Lorenzo. In the following year he completed at S Salvi, near Florence, a celebrated Last Supper, in which all the personages seem to be portraits. This also is a very fine example of his style, though the conception of the subject is not exalted. It is the last monumental work of importance which Andrea del Sarto lived to execute. He dwelt in Florence throughout the memorable siege, which was soon followed by an infectious pestilence. He caught the malady, struggled against it with little or no tending from his wife, who held aloof, and died, no one knowing much about it at the moment, on 22d January 1531, at the comparatively early age of forty-three. He was buried unceremoniously in the church of the Servi.

Various portraits painted by Andrea are regarded as likenesses of himself, but this is not free from some doubt. One is in the London National Gallery, an admirable half-figure, purchased in 1862. Another is at Alnwick Castle, a young man about twenty years of age, with his elbow on a table. Another at Panshanger may perhaps represent in reality the pupil Domenico Costa. Another youthful portrait is in the Ulm Gallery, and the Pitti Gallery contains more than one. Among his more renowned works not already specified are the following: The Virgin and Child, with St Francis and St John the Evangelist and two Angels, now in the Uffizi, painted for the church of S Francesco in Florence, this is termed the Madonna di S Francesco, or Madonna delle Apie, from certain figures of her feet which are deceptively introduced, and is rated as Andrea's masterpiece in depicting The Apparition in the Uffizi, painted for the monastery of S Gallo, the Fathers Disputing on the Doctrine of the Trinity—Sts Augustine, Dominic, Francis, Lawrence, Sebastian, and Mary Magdalene—a very energetic work. Both these pictures are comparatively early—towards 1517. The Charity now in the Louvre (perhaps the only painting which Andrea executed while in France) The Peas, in the Belvoir, two dramatic compositions, the Assumption of the Virgin, also a fine Peas. In the Madrid Museum the Virgin and Child, with Joseph, Elizabeth, the infant Baptist, and an Archangel. In the Louvre the Holy Family, the Baptist pointing upwards. In the Berlin Gallery a portrait of his wife in Panshanger a fine portrait named Laura. The second picture in the National Gallery ascribed to Andrea, a Holy Family, is by some critics regarded as the work rather of one of his scholars—we hardly know why. A very noticeable incident in the life of Andrea del Sarto relates to the copy, which he produced in 1523, of the portrait group of Leo X by Raphael, it is now in the Naples Museum, the original being in the Pitti Gallery. Ottaviano de' Medici, the owner of the original, was solicited by Duke Frederick II. of Mantua to present it to him. Unwilling to part

with so great a pictorial prize, and unwilling also to disoblige the duke, Ottaviano got Andrea to make the copy, which was consigned to the duke as being the original. So deceptive was the imitation that even Giulio Romano, who had himself manipulated the original to some extent, was completely taken in, and, on showing the supposed Raphael's years afterwards to Vasari, who knew the facts, he could only be undeceived when a private mark on the canvas was named to him by Vasari, and brought under his eye. It was Michelangelo who had introduced Vasari in 1524 to Andrea's studio. He is said to have thought very highly of Andrea's powers, saying on one occasion to Raphael, "There is a little fellow in Florence who will bring sweat to you brow if ever he is engaged in great works."

Andrea had fine pictorial style, a very high standard of correctness, and an enviable balance of executive endowments. The point of technique in which he excelled least was perhaps that of discriminating the varying textures of different objects and surfaces. There is not much elevation or idealism in his works—much more of reality. His chiaroscuro is not carried out according to strict rule, but is adjusted to his liking for harmony of colour and fused tone and transparency, in fresco more especially his predilection for varied tints appears excessive. It may be broadly said that his taste in colouring was derived mainly from Fra Bartolommeo, and in form from Michelangelo, and his style partakes of the Venetian and Lombard, as well as the Florentine and Roman—some of his figures are even adapted from Albert Dürer. In one way or other he continued improving to the last. In drawing from nature, his habit was to sketch very slightly, making only such a memorandum as sufficed to work from. The scholars of Andrea were very numerous, but, according to Vasari, they were not wont to stay long, being dominated over by his wife, Pontorme and Domenico Puligo may be mentioned.

In our account of Andrea del Sarto we have followed the main lines of the narrative of G. G. and Cavalcaselle, supplemented by Vasari, Lazzari, and others. There are biographies by Daddi (1839) and by Von Reumont. (W. M. R.)

SASANTIANI See PERSIA

SASINE See SEIXIN

SASSARI, the chief town of the northern province of the island of Sardinia (Italy), is situated in the midst of orange and olive groves at a height of 650 feet above the sea, 1½ miles from Porto Torres, on the railway to Chilivani, a junction on the main line from Terranova to Cagliari. Till about 1860–65 it was surrounded by a high wall built in the 14th century and strengthened by twenty-six large square towers from 60 to 80 feet high. The castle dates from 1327–1331. Originally built in the first half of the 15th century, when the see of Torres (Porto Torres) was removed to Sassari, the cathedral was restored in 1531 and received a new façade in the 18th century. The city besides contains a municipal palace, rebuilt since 1820, an episcopal palace dating originally from the 13th century, and a university (faculties of law and medicine, with 87 students in 1881–2) founded by Philip III. of Spain in 1617, as well as barracks, law courts, hospitals, and asylums. There is a white marble fountain—Fonte di Rosello—on the east side of the town, surmounted by a statue of St Gavinus, patron saint of the city, and from this source water is still hawked about the streets, though waterworks have recently been constructed by the municipality at a cost of upwards of £60,000. Most of the streets are narrow and tortuous, and vehicles are generally drawn by oxen. Sassari is separated by a low and swampy stretch of country from its port at Porto Torres—a village on the site of *Tunis Libionis, Colonia Julia*, with a basilica of the 11th century (S. Gavino) and the ruins of a temple of Fortune now called Palazzo del Re Barbaro. The population of the city was 22,945 in 1862, and 31,596 in 1881.

Sassari appears in the archives of the monastery of San Pietro di Silki in 1118 as *Tathari*, and the local pronunciation is still *Tatari*. In 1294 the town was declared an independent republic, and a very liberal code of laws was published in 1316 (edited by Don Pasquale Tola, Cagliari, 1856). Sassari was sacked by the French in 1527, and in 1796 the Sardinian popular party seized the city, expelled the viceroys, and dismantled the castle and "palaces."

SASSERAM, a subdivision of the Shikhabad district, Bengal, India, between 24° 31' and 26° 23' N. lat. and between 83° 33' and 84° 30' E. long., with an area of 1493

square miles, and a population in 1881 of 519,207 (males 253,757, females 265,450). This subdivision consists of four thanahs or stations, viz., Sasseram, Khargur, Dhargion, and Dehree. The thanah of Sasseram has an area of 691 square miles, and a population (1881) of 155,760 (75,031 males, 80,729 females). It contains the tomb of the Afghan Sher Shah, who conquered Humayun, and subsequently became emperor of Delhi.

SATALI, ADALIA, or ANDALIYER, one of the principal towns on the south coast of Asia Minor, giving the name of Gulf of Adalia to the great bay which the ancients styled Mare Pamphylicum. Arranged like a Greek theatre round the harbour, it presents an unusually picturesque appearance against its background of mountains, and it is enclosed by a triple wall of modern construction, strengthened by a ditch and square towers. Several of the mosques and churches, seventeen in number, are of interest, and contain remains of Roman work. The population was estimated by Spratt at 13,000, of whom 3000 were Greeks. Though the physical changes produced on this part of the coast by the tufaceous deposits of the rivers render the ancient descriptions quite inapplicable to the present town, there is little doubt that Satali not only preserves the name but occupies the site of Attaleia, which was founded by Attalus II Philadelphus, king of Pergamum, and became one of the principal cities of Pamphylia. At an early date it was the see of a Christian bishop.

SATARA, or SATTARAH, a British district in the central division of the Bombay presidency, India, between 16° 50' and 18° 10' N. lat. and 73° 45' and 75° E. long. It has an area of 4988 square miles, and is bounded on the north by the river Nira and the states of Bhor and Phaltan, on the east by Sholapur district, on the south by the Varna river separating it from Kolhapur and Sangli states, and on the west by the Sahyadri mountains, which separate it from the Concan districts of Kolabá and Ratnágiri. The Sátára district contains two main systems of hills, the Sahyadri range and its offshoots, and the Mahádeo range and its offshoots, the former runs through the district from north to south, and the Mahádeo range starts about 10 miles north of Mahábaleshwar and stretches east and south-east across the whole breadth of the district. The Mahádeo Hills are bold and abrupt, presenting in many cases bare scarps of black rock and looking at a distance like so many hill fortresses. Within the limits of Sátára are two river systems—the Bhima system in a small part of the north and north-east, and the Kistna system throughout the rest of the district. (See KISTNA.) The hill forests have a large store of timber and firewood. The whole of Sátára falls within the Deccan trap area, the hills consist of trap intersected by strata of basalt and topped with latente, while, of the different soils on the plains, the commonest is the black loamy clay containing carbonate of lime. This is a very fertile soil, and when well watered is capable of yielding heavy crops. Sátára district contains some important irrigation works,—including the Kistna Canal, open for 35 miles. In some of the western parts of the district the average annual rainfall exceeds 200 inches, but on the eastern side water is scanty, the rainfall varying from 40 inches in Sátára town to less than 12 inches in some places farther east. There is no railway, but the West Deccan Railway, which is in course of construction, will put the district into communication with Poona and Belgaum, and will run through Sátára for about 100 miles. The tiger, panther, bear, and sambar deer are found in the west near the Sahyadris, and the hyena, wolf, leopard, and smaller game in the east.

According to the last census returns (1881) the population of Sátára district was 1,062,350 (532,525 males and 529,825 females). Hindus numbered 1,008,918, Mohammedans 36,712, and Christians

586. Four towns had more than 10,000 inhabitants,—Sátára (see below), Wai 11,676, Kasad 10,778, Tasgaon 10,206. About two-thirds of the Hindus consist of Kunbis and Maháttars, who during the period of Maháttara ascendancy furnished the bulk of the armies, and the Mávlis, who formed Shivájí's best soldiers, were drawn from the hill tribes of Sátára district. Agriculture supports more than three-fourths of the people, the soil is fertile, and jowar forms the staple food, rice is grown in the western valleys, and in the south and east cotton is raised. In 1882-83, of 1,384,255 acres held for tillage, 270,244 were fallow or under grass, while of the remaining 1,114,011 acres 89,757 were twice cropped, cereals, consisting chiefly of jowar and bayra, occupied 898,206 acres, pulses 169,211 acres, oil-seeds 42,001 acres, and miscellaneous crops the remainder. Besides blankets and coarse cotton cloth the chief exports are gum, tobacco, oil seeds, chilies, molasses, and a little raw cotton, the imports are rice, goods, hardware, salt, and dates. The gross revenue of the district in 1883-84 amounted to £268,779, of which the land contributed £228,749.

On the overthrow of the Jadhav dynasty in 1312 the district passed to the Mohammedan power, which was consolidated in the reign of the Bahmani kings. On the fall of the Bahmanis towards the end of the 15th century each chief set up for himself until the Buguin kings finally asserted themselves, and under these kings the Maháttars arose, and laid the foundation of an independent kingdom with Sátára as its capital. Intrigues and dissensions in the palace led to the ascendancy of the peshwas, who removed the capital to Poona in 1749, and degraded the raja of Sátára into the position of a political prisoner. The wai of 1817 closed the career of the peshwas, and the British then restored the titular raja, and assigned to him the principality of Sátára. In consequence of political intrigues, he was deposed in 1839, and his brother was placed on the throne. This prince dying without male heirs, the state was resumed by the British Government.

SATARA, chief town and headquarters of the above district, is situated in 17° 41' 25" N. lat. and 74° 2' 10" E. long., immediately below a remarkably strong hill fort on the summit of a small, steep, rocky hill. It takes its name from the seventeen walls, towers, and gates which the Sátára fort was supposed to possess. With a height of 2320 feet above sea-level, Sátára is about 60 miles from the coast, and 69 miles south of Poona. Since the death of the last raja in 1848 the population has considerably decreased, still Sátára contained in 1881 some 28,601 inhabitants (14,558 males and 14,043 females).

SATIN-WOOD, a beautiful light-coloured hard wood having a rich silky lustre, sometimes finely mottled or grained, the produce of a large tree, *Chloroerylon Swietenia*, native of India and Ceylon. A similar wood, known under the same name, is obtained in the West Indies, the tree yielding which is said to be *Mala guanensis*. Satin-wood was in request for rich furniture about the end of the 18th century, the fashion then being to ornament panels of it with painted medallions and floral scrolls and borders. Now it is used for inlaying and small veneers, and most largely in covering the backs of hair and clothes-brushes and in making small articles of turnery.

SATIRE. Satire, in its literary aspect, may be defined as the expression in adequate terms of the sense of amusement or disgust excited by the ridiculous or unseemly, provided that humour is a distinctly recognizable element, and that the utterance is invested with literary form. Without humour, satire is uneffective, without literary form, it is mere clownish jeering. It is indeed exceedingly difficult to define the limits between satire and the regions of literary sentiment into which it shades. The lofty ethical feeling of a Johnson or a Carlyle borders it on the one hand, the witty sarcasm of a Talleyrand, rancorous or good-natured, on the other, but, however exalted the satirist's aims, or amiable his temper, a basis of contempt or dislike is the groundwork of his art. Thus feeling may be diverted from the failings of man individual to the feebleness and imperfection of man universal, and the composition may still be a satire, but if the element of scorn or sarcasm were entirely eliminated it would become a sermon. That this expression of aversion is of the essence of satire appears from the fact that the literary power which, the more it is exerted upon

grave and elevated subjects, removes them further and further from the domain of satire can confer satiric dignity upon the most scurrilous lampoon. The distinction between the intellectual form and the raw material of satire is admirably illustrated by a passage in an accomplished novelist. The clever young lady happening to compare a keen and bright person to a pair of scissors, her unrefined companion is for the moment unable to understand how a human being can resemble a piece of cutlery, but suddenly a light breaks in upon her, and, taking up a broken pair of scissors from the table, she imitates the halting gait of a lame lady, declaring that Miss Brown resembles that particular pair of scissors to the life. The first interlocutor could have been satirical if she would, the second would if she could. The nice and delicate perception of the former type of character may be fairly driven into satire by the vulgarity and obtuseness of the second, as in the case of Miss Austen, and it may be added that the general development of civilization, repressing high-handed wrongs against which ridicule is no defence, and encouraging failings which can be effectually attacked in no other manner, continually tends to make satire more congenial to the amiable and refined, and thus exalt its moral tone and purpose.

The first exercise of satire was no doubt sufficiently coarse and boisterous. It must have consisted in glancing at personal defects, and Homer's description of Theoclytus, the earliest example of literary satire that has come down to us, probably conveys an accurate delineation of the first satirists, the carpers and fault-finders of the clan. The character reappears in the heroic romances of Ireland, and elsewhere, and it is everywhere implied that the licensed backbiter is a warped and distorted being, reader with his tongue than his hands. The verdict of unsophisticated man on satire is clearly that it is the offspring of ill-nature, to redeem and dignify it by rendering it the instrument of morality or the associate of poetry was a development implying considerable advance in the literary art. The latter is the course adopted in the Old Testament, where the few passages approximating to satire, such as Jotham's parable of the bramble and Job's ironical address to his friends, are embellished either by fancy or by feeling. An intermediate stage between personal ridicule and the correction of faults and follies seems to have been represented in Greece by the *Meurgates*, attributed to Homer, which, while professedly lampooning an individual, practically rebuked the meddling sciolism impersonated in him. In the accounts that have come down to us of the writings of Archilochus, the first great master of satire (about 700 B.C.), we seem to trace the elevation of the instrument of private animosity to an element in public life. Though a merciless assailant of individuals, Archilochus was also a distinguished statesman, naturally for the most part in opposition, and his writings seem to have fulfilled many of the functions of a newspaper press. Their extraordinary merit is attested by the infallible judgment of Quintilian eight hundred years after their composition, and Gorgias's comparison of them with Plato's persiflage of the Sophists proves that their virulence must have been tempered by grace and refinement. Archilochus also gave satiric poetry its accepted form by the invention of the iambic trimeter, slightly modified into the scazonic metre by his successors. Simonides of Amorgus, about a generation later, and Hipponax, a century later still, were distinguished like Archilochus for the bitterness of their attacks on individuals, with which the former combined a strong ethical feeling, and the latter a bright active fancy. All three were restless and turbulent, aspiring and discontented, impatient of abuses and theoretically enamoured of liberty; and the loss of their writings, which would

have thrown great light on the politics as well as the manners of Greece, is exceedingly to be lamented. With Hipponax the direct line of Greek satire is interrupted, but two new forms of literary composition, exceedingly capable of being rendered the vehicles of satire, almost simultaneously make their appearance. Fable is first heard of in Asiatic Greece about this date, and, although its original intention does not seem to have been satirical, its adaptability to satiric purposes was soon discovered and tuned to account. A far more important step was the elevation of the rude fun of rustic merrymakings to a literary status by the evolution of the drama from the Bacchic festival. The means had now been found of alloying the satiric spirit with exalted poetry, and their union was consummated in the person of a poet who combined humour with imagination in a degree never again to be rivalled until Shakespeare. Every variety of satire is exemplified in the comedies of Aristophanes, and if he does not rank as the first of satirists it is only because he is so much beside. Such effluence of poetical genius could not be perpetual, any more than the peculiar political and social conditions which for a time made such fearless and uncontrolled satire possible. Through the half-way house of mythological parody the comedy of public life passes into the comedy of manners, metrical still, but approximating more closely to prose, and consequently to satire on its own side of the line which it is convenient if not strictly logical to trace between dramatists and ordinary satiric writers. The step from Menander to Lucilius is not a long one, but it was not destined to be taken by a Greek.

A rude form of satire had existed in Italy from an early date in the shape of the Fescennine verses, the rough and licentious pleasantries of the vintage and harvest, which, lasting down to the 16th century, inspired Tassili's *Vendemmiatori*. As in Greece, these eventually, about 364 B.C., were developed into a rude drama, originally introduced as a religious expiation. This was at first, Livy tells us (vi. 3), merely pantomime, as the dialect of the Tuscan actors imported for the occasion was not understood at Rome. Verse, "like to the Fescennine verses in point of style and manner," was soon added to accompany the mimetic action, and, with reference to the variety of metres employed, these probably improvised compositions were entitled *Saturæ*, a term denoting *miscellany*, and derived from the *satura lana*, "a charger filled with the first-fruits of the year's produce, anciently offered to Bacchus and Ceres." The Romans thus had originated the name of satire, and, in so far as the Fescennine drama consisted of jallery and ridicule, possessed the thing also, but it had not yet assumed a literary form among them. Livius Andronicus (240 B.C.), the first regular Latin dramatic poet, appears to have been little more than a translator from the Greek. Satires are mentioned among the literary productions of Ennius (200 B.C.) and Pacuvius (170 B.C.), but the title rather refers to the variety of metres employed than to the genus of the composition. The real inventor of Roman satire is Caius Lucilius (148-103 B.C.), whose *Saturæ* seem to have been mostly satirical in the modern acceptation of the term, while the subjects of some of them prove that the title continued to be applied to miscellaneous collections of poems, as was the case even to the time of Varro, whose "Saturæ" included prose as well as verse, and appear to have been only partially satirical. The fragments of Lucilius preserved are unfortunately very scanty, but the verdict of Horace, Cicero, and Quintilian demonstrates that he was a very considerable poet. It is needless to dwell on compositions so universally known as the *Saturæ* of Lucilius's successor Horace, in whose hands this class of composition received

an entirely new development, becoming genial, playful, and persuasive. "Arch Horace stovt to mend" The didactic element preponderates still more in the philosophical satires of Persius, the propagandist of Stoicism, a writer whose intensity, dramatic gift, obscurity, and abruptness render him, like the Browning and Meredith of our own days, the luxury of the few and the de-jan of the many. Yet another form of satire, the rhetorical, was carried to the utmost limits of excellence by Juvenal, the first example of a great tragic satirist. Nearly at the same time Martial, improving on earlier Roman models now lost, gave that satirical turn to the epigram which it only exceptionally possessed in Greece, but has ever since retained. The brevity, pregnancy, and polish of the Latin tongue were never more felicitously exemplified than by this gifted writer. About the same time another variety of satire came into vogue, destined to become the most important of any. The Milesian tale, a form of entertainment probably of Eastern origin, grew in the hands of Petronius and Apuleius into the satirical romance, immensely widening the satirist's field and exempting him from the restraints of metre. Petronius's "Supper of Trimalchio" is the revelation of a new vein, never fully worked till our days. As the novel arose upon the ruins of the epic, so dialogue sprung up upon the wreck of comedy. In Lucian comedy appears adapted to suit the exigencies of an age in which a living drama had become impossible. Lucian's position as a satirist is something new, and could not, from the nature of the case, have been occupied by any of his predecessors. For the first time since the origin of civilization society felt apprehensive of impending dissolution, and its fears found an interpreter in the Sophist of Samosata, "the Voltare of paganism," an universal censor and mocker, devoid of the Christian's hope of general renovation, and unable to foresee the new social order which the barbarian conquest was destined to create. Next to his wit, Lucian's special note is his sturdy love of truth and demand for genuineness in all things. With him antique satire expires as a distinct branch of literature,—though mention should be made of the sarcasms and libels with which the population of Egypt were for centuries accustomed to insult the Roman conqueror and his parasites. An exceedingly curious specimen, a denunciation of the apostate poet Hor-Uta—a kind of Egyptian "Lost Leader"—composed under Augustus, has recently been published by M. Revillout from a demotic papyrus.

It is highly interesting to remark how, after the great deluge of barbarism has begun to retire, one form of satire after another peeps forth from the receding flood, the order of development being determined by the circumstances of time and place. In the Byzantine empire, indeed, the link of continuity is unbroken, and such rallying of abuses as is possible under a despotism finds vent in the pale copies of Lucian published in Ellissen's *Analekten*. The first really important satire, however, is a product of Western Europe, recurring to the primitive form of fable, upon which, nevertheless, it constitutes a decided advance. *Reynard the Fox*, a genuine expression of the shrewd and homely Teutonic mind, is a landmark in literature. It gave the beast-epic a development of which the ancients had not dreamed, and showed how cutting ridicule could be conveyed in a form difficult to resent. About the same time, probably, the popular instinct, perhaps deriving a hint from Rabbinical literature, fashioned Morolf, the prototype of Sancho Panza, the incarnation of sublimar mother-wit contrasted with the starchy wisdom of Solomon, and the *Till Eulenspiegel* is a kindred Teutonic creation, but later and less significant. *Piers Ploughman*, the next great work of the class, adapts

the apocalyptic machinery of monastic and anchoritic vision to the purposes of satire, as it had often before been adapted to those of ecclesiastical aggrandizement. The clergy were scourged with their own rod by a poet and a Puritan too earnest to be urbane. Satire is a distinct element in Chaucer and Boccaccio, who nevertheless cannot be ranked as satirists. The mock-heroic is successfully revived by Pulci, and the political songs of the 14th and 15th centuries attest the diffusion of a sense of humour among the people at large. The Renaissance, restoring the knowledge and encouraging the imitation of classic models, sharpened the weapons and enlarged the armoury of the satirist. Partly, perhaps, because Erasmus was no poet, the Lucianic dialogue was the form in the ascendant of his age. Erasmus not merely employed it against superstition and ignorance with infinite and irresistible pleasantry, but fired by his example a bolder writer, untampered with by the dignity of an arbiter in the republic of letters. The ridicule of Ulrich von Hutten's *Epistolæ Obscurorum Virorum* is annihilating, and the art there for the first time fully exemplified though long previously introduced by Plato, of putting the icicle into the mouth of the victim, is perhaps the most deadly shaft in the quiver of sarcasm. It was afterwards used with even more pointed wit though with less exuberance of humour by Pascal, the first modern example, if Dante may not be so classed, of a great tragic satirist. Ethical satire is vigorously represented by Sebastian Brant and his imitator Alexander Barclay, but in general the metrical satirists of the age seem tame in comparison with Erasmus and Hutten, though including the great name of Machiavelli. Sir Thomas More cannot be accounted a satirist, but his idea of an imaginary commonwealth embodied the germ of much subsequent satire. In the succeeding period politics take the place of literature and religion, producing in France the *Satyre Menippée*, elsewhere the satirical romance as represented by the *Argenis* of Barclay, which may be defined as the adaptation of the style of Petronius to state affairs. In Spain, where no freedom of criticism existed, the satire spirit took refuge in the *novela picaresca*, the prototype of *Le Sage* and the ancestor of Fielding. Quevedo revived the mediæval device of the vision as the vehicle of reproof, and Cervantes's immortal work might be classed as a satire were it not so much more. About the same time we notice the appearance of direct imitation of the Roman satirists in English literature in the writings of Donne, Hall, and Maistron, the further elaboration of the mock-heroic by Tassoni, and the culmination of classical Italian satire in Salvatore Rosa. The prodigious development of the drama at this time absorbed much talent that would otherwise have been devoted to satire proper. Most of the great dramatists of the 17th century were more or less satirists, Molière perhaps the most consummate that ever existed, but, with an occasional exception like *Les Précieuses Ridicules*, the range of their works is too wide to admit of their being regarded as satires. The next great example of unadulterated satire is Butler's *Hudibras*, and perhaps one more truly representative of satiric aims and methods cannot easily be found. At the same period dignified political satire, bordering on invective, received a great development in Andrew Marvell's *Advice to a Painter*, and was shortly afterwards carried to perfection in Dryden's *Axalom* and *Achitophel*, while the light literary parody of which Aristophanes had given the pattern in his assaults on Euripides, and which Shakespeare had handled somewhat carelessly in the *Midsummer Night's Dream*, was effectively revived in the duke of Buckingham's *Rehearsal*. In France Boileau was long held to have attained the *ne plus ultra* of the Horatian style in satire and of the mock-heroic, but Pope was soon

to show that further progress was possible in both. The polish, point, and concentration of Pope remain unsurpassed, as do the amenities of Addison and the daring yet severely logical imagination of Swift, while the *History of John Bull* and the *Pseudologia* place their friend Arbuthnot in the first rank of political satirists. The 18th century was, indeed, the age of satire. Serious poetry had for the time worn itself out, the most original geniuses of the age, Swift, Defoe, and Richardson, are decidedly prosaic, and Pope, though a true poet, is less of a poet than Dryden. In process of time imaginative power revives in Goldsmith and Rousseau, meanwhile Fielding and Smollett have fitted the novel to be the vehicle of satire and much beside, and the literary stage has for a time been almost wholly engrossed by a colossal satirist, a man who has dared the universal application of Shaftesbury's maxim that ridicule is the test of truth. The world had never before seen a satirist on the scale of Voltaire, nor had satire ever played such a part as a factor in impending change. The parallel with Lucian is in some respects very close. Toleration was Voltaire's idol, as truth was Lucian's, and thus, among more than his predecessor at the practical reformation of manners and institutions, his work was less purely negative. He was nevertheless a destroyer, and as utterly out of sympathy with the positive spirit of science for which he was preparing the way as Lucian could possibly be with Goths or Christians. As a master of satiric mockery he is unsurpassed, his manner is entirely his own, and he is one of the most intensely national of writers, notwithstanding his vast obligations to English humorists, statesmen, and philosophers. English humour also played an important part in the literary regeneration of Germany, where, after Lessing and Rabener, direct imitators of Swift and the essayists, Lessing, imbued with Pope but not mastered by him, showed how powerful an auxiliary satire can be to criticism,—a relation which Pope had somewhat inverted. Another great German writer, Wieland, owes little to the English, but adapts Lucian and Petronius to the 18th century with playful if somewhat mannered grace. Kottum's *Jobiad*, a most humorous poem, innovates successfully upon established models by making low life, instead of chivalry, the subject of burlesque. Goethe and Schiller, Scott and Wordsworth, are now at hand, and as imagination gains ground satire declines. Byron, who in the 18th century would have been the greatest of satirists, is hurried by the spirit of his age into passion and description, bequeathing, however, a splendid proof of the possibility of allying satire with sublimity in his *Vision of Judgment*. Moore gives the epigram a lyrical turn, Béranger, not for the first time in French literature, makes the gay chanson the instrument of biting jest, and the classic type receives fresh currency from Auguste Barbier. Courier, and subsequently Cormenin, raise the political pamphlet to literary dignity by their poignant wit. Peacock evolves a new type of novel from the study of Athenian comedy. Miss Edgeworth skirts the confines of satire, and Miss Austen, the most refined and delicate of all observers of manners, seasons her novels with the most exquisite satiric traits. Washington Irving revives the manner of *The Spectator*, and Tuck brings irony and persiflage to the discussion of critical problems. Two great satiric figures remain,—one representative of his nation, the other most difficult to class. In all the characteristics of his genius Thackeray is thoroughly English, and the faults and follies he chastises are those especially characteristic of British society. Good sense and the perception of the ridiculous are amalgamated in him; his satire is a thoroughly British article, a little over-sold, a little wanting in finish, but honest, weighty, and durable. Posterity will go to him for the humours of the age of Victoria, as they

go to Addison for those of Anne's. But Heine hardly belongs to any nation or country, time or place. He ceased to be a German without becoming a Frenchman, and a Jew without becoming a Christian. Only one portrait really suits him, that in Tuck's allegorical tale, where he is represented as a capricious and mischievous elf, but his song is sweeter and his command over the springs of laughter and tears greater than it suited Tuck's purpose to acknowledge. In him the satiric spirit, long confined to established literary forms, seems to obtain untrammelled freedom to wander where it will, nor have the ancient models been followed since by any considerable satirist except the Italian Guisti. The machinery employed by Moore was indeed transplanted to America by Russell Lowell, whose *Biglow Papers* represent perhaps the highest moral level yet attained by satire. In no age has the spirit of satire been so generally diffused as in the 19th century, but many of its eminent writers, while bolder on the domains of satire, escape the definition of satirist. The term cannot be properly applied to Dickens, the keen observer of the oddities of human life, or to George Eliot, the critic of its emptiness when not inspired by a worthy purpose, or to Balzac, the painter of French society, or to Trollope, the mirror of the middle classes of England. If *Sartor Resartus* could be regarded as a satire, Carlyle would rank among the first of satirists, but the satire, though very obvious, rather accompanies than inspires the composition. The number of minor satirists of merit, on the other hand, is legion, and but few can be mentioned here. Poole, in his broadly farcical *Little Pedlington*, has rung the changes with inexhaustible ingenuity on a single fruitful idea. Jerrold's comedies sparkle with epigrams, and his tales and sketches overflow with quaint humour, Mallock has made the most of personal mimicry, the lowest form of satire; Samuel Butler holds an inviting mirror to the world's face with imperturbable gravity, Countrope reproduces the airy grace and sonorous melody of the Attic comedy, and the anonymous writer of the "Barnum" Christmas number of *Truth* has associated with equal effect its reckless fun and personality. One remarkable feature of the age is the union of caricature with literature to a degree inconceivable before the improvements in wood-engraving. All large capitals now have their comic illustrated journals, destined for the most part to be the marvels and stumbling-blocks of posterity. *Punch*, however, has become almost a national institution, and has fostered the genus of two pictorial satirists of the first rank, Leech and Tenniel. The present tendencies of the civilized world seem highly favourable to the influence of satire as a factor in human affairs, but unfavourable to the production of satiric masterpieces. Satire is the inevitable concomitant of freedom of speech, which must continue to prevail and diffuse itself unless checked by military or socialistic despotism. But as the privilege of the many it is less likely to be the resource of the few, and it may happen that the press, dealing with follies of the day as they arise, will more and more forestall the satire that springs from meditation and study. The principal security is the originality and robustness of true satiric genius, which, having defied prisons and scaffolds in the past, may find the means of eluding public impatience and satiety in the future. (R. G.)

SATRAPH See PERSIA, vol. xviii. pp. 569, 583

SATURN, an ancient Italian god, whom the Romans, and till recently the moderns, identified with the Greek god Cronus

1 Cronus was the youngest of the Titans, the children of Sky (Uranus) and Earth (Gaë). Besides the Titans, Sky and Earth had other children, the Cyclopes and the Hundred-handers. When the Cyclopes and the Hundred-handers proved troublesome, Sky thrust them back into

the bosom of Earth. This vexed Earth, and she called on her sons to avenge her on their father Sky. They all brank from the deed save Cronus, who waylaid and mutilated his father with a sickle or curved sword. From the drops of blood which fell to the earth sprang the Furies and the Giants. Cronus now reigned in loom of Sky. His wife was Rhea, who was also his sister, being a daughter of Sky and Earth. Sky and Earth had foretold to Cronus that he would be deposed by one of his own children, so she swallowed them one after another as soon as they were born. Thus he devoured Hestia, Demeter, Hera, Hades, and Poseidon. But when Rhea had brought forth Zeus, the youngest,¹ she wrapped up a stone in swaddling clothes and gave it to Cronus, who swallowed it instead of the babe. When Zeus, who had been hidden in Crete, grew up, he gave his father a dose which compelled him to disgorge first the stone and then the children whom he had swallowed. The stone was preserved at Delphi, every day it was anointed and on festivals it was crowned with wool. Zeus and his brothers now rebelled against Cronus, and after a ten years' struggle they were victorious. Cronus and the Titans were thrust down to Tartarus, where they were guarded by the Hundred-handers. According to others, Cronus was removed to the Islands of the Blessed, where he ruled over the departed heroes, judging them in conjunction with Rhadamanthus. Plutarch (*De Def. Orac.*, 18) mentions a story that the dethroned monarch of the gods slept on an island of the northern seas guarded by Briareus and surrounded by a train of attendant divinities. The reign of Cronus was supposed to have been the happiest time of the world, the golden age, when men lived like gods, free from toil and grief and the weakness of old age (for death was like sleep), and the earth too brought forth abundantly without cultivation. There are few traces of the worship of Cronus in Greece. Pausanias, in his description of Greece, mentions only one temple of Cronus, it stood at the foot of the Acropolis at Athens and was sacred to Cronus and Rhea jointly. The Athenians celebrated an annual festival in his honour on the 12th of Hecatombæon. A mountain at Olympia was called after him, and on its top annual sacrifices were offered to him at the spring equinox.

The idea that Cronus was the god of time—an idea which appears in antiquity—seems to have arisen from a simple confusion between the words Cronus and Chronus ("time"). Cronus derives from the root *kron*, meaning "to accomplish." Cronus may perhaps have been a god of some aboriginal half-savage tribe which the Greeks conquered. Hence the savage traits in his legend, his conquest by Zeus, and the scanty traces of his worship in Greece. The myth of the mutilation of Sky by Cronus may be a particular form of the widespread story of the violent separation of Sky and Earth by one of their children (compare *Mythology*). Other forms of this myth are found in New Zealand, India, and China. Parallels to the swallowing and disgorging incident are to be found in the folk-lore of Bushmen, Kafirs, Basutos, Indians of Guiana, and Eskimo.

2. Saturn and his wife Ops were amongst the oldest deities of ancient Italy. He is said to have had an altar at the foot of the Capitol before Rome was founded. Saturn was a god of agriculture, his name being derived from *serere*, "to sow." The identification of Saturn with Cronus gave rise to the legend that after his deposition by Zeus (Jupiter) Saturn wandered to Italy, where he ruled as king in the golden age and gave the name Saturnia to the country. Janus, another of the most ancient gods of Italy, is said to have welcomed him to Rome, and here he settled at the foot of the Capitol, which was called after him the Saturnian Hill. His temple stood at the ascent from the Forum to the Capitol and was one of the oldest buildings in Rome, but the eight remaining columns of

the temple probably formed a portion of a new temple built in the imperial times. The image of Saturn in this temple had woollen bands fastened round its feet all the year through, except at the festival of the Saturnalia, the object of the bands was probably to detain the deity. Similarly there was a fettered image of Enyalios (the War God) at Sparta, and at Athens the image of Victory had no wings, lest she might fly away. The mode of sacrifice at this temple was in so far peculiar that the head of the sacrifice was bare as in the Greek ritual, instead of being covered, as was the usual Roman practice. Legend said that the Greek ritual was introduced by Hercules, who at the same time abolished the human sacrifices previously offered to Saturn. Others said that the rule had been observed by the Pelasgians before. Under or behind the temple was the Roman treasury, in which the archives as well as the treasures of the state were preserved. Dionysius Halicarnensis (*Ant. Rom.*, 3.34) tells that there were many sanctuaries of Saturn in Italy and that many towns and places, especially mountains, were called after him. The oldest national form of verse was known as the Saturnian. Like many other figures in Roman mythology, Saturn is said to have vanished at last from earth. His emblem was a sickle. The substitution of a great scythe for the sickle, and the addition of wings and an hour-glass, are modern. Ops ("plenty"), wife of Saturn, was an earth-goddess, as appears from the custom observed by her suppliants of sitting and carefully touching the earth while they made their vows to her. As goddess of crops and the harvest she was called *Conserva*, and under this name had a sanctuary at Rome, to which only the Vestals and the priest were admitted. As Saturn was identified in later times with Cronus, so was Ops with Rhea. Another goddess mentioned as wife of Saturn was Lua, a goddess of barrenness. She was one of the deities to whom after a victory the spoils of the enemy were sometimes dedicated and burned.

Saturnalia.—This, the great festival of Saturn, was celebrated on the 19th, but after Caesar's reform of the calendar on the 17th, of December. Augustus decreed that the 17th should be sacred to Saturn and the 19th to Ops. Hence it appears that the 17th and 18th were devoted to the Saturnalia, and the 18th and 20th to the Opalia, a festival of Ops. Caligula added a fifth day, "the day of youth" (*dies juvenalis*), devoted no doubt to the sports of the young. But in popular usage the festival lasted seven days. The time was one of general joy and mirth. The woollen fetters were taken from the feet of the image of Saturn, and each man offered a pig. During the festival schools were closed, no war was declared or battle fought, no punishment was inflicted. In place of the toga an undress garment was worn. Distinctions of rank were laid aside, slaves sat at table with their masters or were actually waited on by them, and the utmost freedom of speech was allowed them. Gambling with dice, at other times illegal, was now permitted and practised. All classes exchanged gifts, the commonest being wax tapers and clay dolls. These dolls were especially given to children, and the makers of them had a regular fair at this time. Varro thought that these dolls represented original sacrifices of human beings to the infernal god. There certainly was, as we have seen, a tradition that human sacrifices were once offered to Saturn, and the Greeks and Romans gave the name of Cronus and Saturn to a particularly cruel Phœnician Baal, to whom, *e.g.*, children were sacrificed at Carthage. The Cronus to whom human sacrifices are said to have been offered in Rhodes was most probably a Baal, for there are unmistakable traces of Phœnician worship in Rhodes. It may be conjectured that the Saturnalia was originally a celebration of the winter solstice. Hence the legend that it was instituted by Romulus under the name of the *Brumalia* (*bruma* = winter solstice). The prominence given to candles at the festival points to the custom of making a new fire at this time. The custom of solemnly kindling fires at the summer solstice (Eve of St. John) has prevailed in most parts of Europe, notably in Germany, and there are traces (of which the yule-log is one) of the observance of a similar custom at the winter solstice. In ancient Mexico a new fire was kindled, amid great rejoicings, at the end of every period of fifty-two years.

The designation of the planets by the names of gods is at least as

¹ So Hesiod. But according to Homer Zeus was the eldest of the children of Cronus and Rhea.

² It is curious to find a similar rule with a similar exception in Nepal. See H. A. Oldfield, *Sketches from Nepal*, vol. i. pp. 353-54.

old as the 4th century B.C. The first certain mention of the star or Cronus (Saturn) is in Aristotile (*Metaphysics*, p. 1073b, 35). The name also occurs in the *Epinomis* (p. 987b), a dialogue of uncertain date, wrongly ascribed to Plato. In Latin, *Cicero* (1st century B.C.) is the first author who speaks of the planet Saturn. The application of the name Saturn to a day of the week (*Saturus dies*, Saturday) is first found in Tibullus (l. 3, 18). (J. G. FR.)

SATYR. In ancient Greek mythology the satyrs were spirits, half-human half-bestial, that haunted the woods and mountains, companions of Pan and Dionysus. Fancy represented them as strongly built, with flat noses, pointed ears, and the tails of horses or goats. They were a roguish and wanton but faint-hearted folk, lovers of wine and women, ever roaming the wild to the music of pipes and cymbals, castanets and bagpipes, dancing with the nymphs or pursuing them, striking terror into men, whose cattle they killed and whose women they made love to. In the earlier Greek art they appear as old and ugly, much like wild apes, but in later art, especially in works of the Attic school, this savage character is softened into a more youthful and graceful aspect. There is a famous statue supposed to be a copy of a work of Praxiteles, representing a graceful satyr leaning against a tree with a flute in his hand. In Africa there was a species of drama known as the Satyrn drama, it parodied the legends of gods and heroes, and the chorus was composed of satyrs. Euripides's play of the *Cyclops* is the only extant example of this kind of drama. The symbol of the sky and timid satyr was the hare. In some districts of modern Greece the spirits known as *Calicantars* offer points of resemblance to the ancient satyrs, they have goats' ears and the feet of asses or goats, are covered with hair, and love women and the dance. The herdsmen of Parnassus believe in a demon of the mountain who is lord of hares and goats.

In the Authorized Version of Isa. xlii. 21, xxxiv. 14 the word "satyr" is used to render the Hebrew *š'š'ym*, "hairy ones." A kind of demon or supernatural being known to Hebrew folk-lore as inhabiting waste places is meant; a practice of sacrificing to the *š'š'ym* is alluded to in Lev. xxi. 7, where E. V. has "devils." They correspond to the "sluggish demon of the mountain-pass" (*azab al-akaba*) of old Arab superstition. But the satyrs of the gloomy Semitic deserts, hairy in which is not yet extinct, are much more terrible than those of Greece.

SAUL, son of Kish, king of Israel. (See ISRAEL, vol. xii. p. 403 s.) The name of Saul's father Kish (כיש) seems to be identical with the Arabic proper name and god-name Kays.

SAUMAISE. See SALMASTUS.

SAUMAREZ, JAMES SAUMAREZ or SAUMAREZ, BARON DE (1757–1836), English admiral, was descended from an old family, and was born at St Peter Port, Guernsey, 11th March 1757. Many of his ancestors had distinguished themselves in the naval service, and he entered it as midshipman at the age of thirteen. For his bravery at the attack of Charleston in 1775 on board the "Bristol" he was raised to the rank of lieutenant, and he was promoted commander for his gallant services off the Dogger Bank, 5th August 1781, when he was wounded. In command of the "Russell," he contributed to Rodney's victory over De Grasse, 12th April 1782. For the capture of "La Réunion," a French frigate, in 1793 he received the honour of knighthood. While in command of a small squadron he was on 5th June 1794 attacked by a superior French force on the way from Plymouth to Guernsey, but by his seamanship and coolness succeeded in gaining a safe anchorage in the harbour of that island. After being promoted to the "Orion" of 74 guns in 1795, he took part in the defeat of the French fleet off L'Orient, 22d June, distinguished himself in the battle of Cape St Vincent in February 1797, and was present at the blockade of Cadiz from February 1797 to April 1798, and at the battle of the Nile, 1st August 1798, where he was wounded. On his return from Egypt he received the

command of the "Casar," 84 guns, with orders to watch the French fleet off Brest during the winters of 1799 and 1800. In 1801 he was raised to the rank of rear-admiral of the blue, was created a baronet, and received the command of a small squadron which was destined to watch the movements of the Spanish fleet at Cadiz. To prevent a fleet of British merchantmen from falling into the hands of the enemy, he engaged the French and Spanish fleets, which outnumbered his own small squadron by two to one, inflicting on them a severe defeat with a loss of 3000 men. Regarding this achievement Lord Nelson remarked that "a greater action was never fought." For his services Saumarez was rewarded with the order of the Bath, and he also received the freedom of the city of London, together with a magnificent sword. In 1803 he received a pension of £1200 a year. On the outbreak of the war with Russia in 1809 he was entrusted with the command of the Baltic fleet, and in recognition of his services Charles XIII. of Sweden bestowed on him the grand cross of the military order of the Sword. At the peace of 1814 he attained the rank of admiral; and in 1819 he was made rear-admiral, in 1821 vice-admiral of Great Britain. He was raised to the peerage as Baron de Saumarez in 1831, and died at Guernsey, 9th October 1836.

See *Memoirs of Admiral Lord de Saumarez*, by Sir John Ross, 2 vols., 1838.

SAUMUR, a town of France, at the head of an arrondissement in the department of Maine-et-Loire, is situated on an island and on the left bank of the Loire, 38 miles south-west of Tours, and 27 miles south-east of Angers. A large metal bridge connects the Tours-Angers railway with that of Montreuil-Bellay by which Saumur communicates with Puters and Niort. Two stone bridges (755 and 905 feet long) also unite the town on the island with the two banks of the river. Several of the Saumur churches are interesting. St Pierre, of the 12th century, has a 17th-century facade and a Renaissance nave; and Notre Dame of Nantilly (often visited by Louis XI.) has a remarkable though greatly damaged facade, a doorway and choir of the 12th century, and a nave of the 11th. Both these churches contain curious tapestries, and in the latter, fixed in the wall, is the copper cross of Gilles de Tyr, keeper of the seals to St Louis. St Jean is a charming little building in the Angevine Gothic style. Notre Dame of Ardiers, of the 16th century, was enlarged in the following century by Richelieu and Madame de Montespan. The town-house is an elegant 16th-century edifice; and the whole town is rich in graceful and interesting examples of the best period of French domestic architecture. The castle, built between the 11th century and the 13th, and remodelled in the 16th, is used as an arsenal and powder magazine. There is also an interesting almshouse, with its chambers in part dug out in the rock. The cavalry school, founded in 1768, and after various interruptions reorganized in 1824 and 1853, has at the present time (1886) 400 pupils, of whom 125 are officers. Other establishments are a public library, a museum of natural history and local Roman and Celtic antiquities, a horticultural garden, with a school of vines in which eight hundred kinds of grapes are cultivated. Saumur carries on a large trade in sparkling white wines grown in the neighbourhood, as well as in brandy, grain, flax, and hemp, and it manufactures enamels and rosaries. The population in 1881 was 13,439 (14,186 in the commune).

The Saumur caves along the Loire and on both sides of the valley of the Thouet (a left-hand tributary) must have been occupied at a very remote period. The Tour du Tronc (9th century) served as a place of refuge for the inhabitants of the surrounding district during foreign invasions, and became the nucleus of a monastery built by monks escaped from St Florent le Vieil. On the same site rose the castle of Saumur two hundred years later. The town fell into the hands of Foulques Nerra, duke of Anjou, in 1025, and

passed in the 13th century into the possession of the Kings of France, to whom it remained constantly faithful. The English failed to capture it during all the course of the Hundred Years' War. After the Reformation the town became the metropolis of Protestantism in France and the seat of a theological seminary, illustrated by many distinguished names. The school of Saumur, as opposed to that of Sedan, represented the more liberal end of French Protestantism (Cameron, Amyntae, &c.) In 1623 the fortifications were dismantled, and the evacuation of the edict of Nantes reduced the population from 25,000 to 8000.

SAUNDERSON, NICHOLAS (1682-1739), mathematician, was born at Thurlstone, Yorkshire, in January 1682. When about a year old he lost his sight through smallpox; but this did not prevent him from acquiring, by the help of kind friends, a good knowledge of Latin and Greek, and pursuing with assiduity and success the study of mathematics. In his twenty-fifth year he commenced lecturing in Cambridge on the principles of the Newtonian philosophy, and, though he was not a member of any of the colleges, the university authorities placed no impediment in his way. In November 1711 he was selected to succeed Whiston, the Lucasian professor of mathematics in Cambridge, after having had the degree of master of arts conferred upon him to render him eligible for the appointment. He was created doctor of laws in 1738 by command of George II., and in 1736 was admitted a member of the Royal Society. He died of scurvy on the 19th of April 1739.

Saunderson possessed the friendship of many of the eminent mathematicians of the time, such as Newton, Halley, de Moivre, Cotes, and for the first of these he entertained a profound veneration. "Whether from an inflexible love of truth, or from a motive less exalted, he was accustomed to speak his sentiments regarding persons very freely, and friends as well as enemies were criticized without reserve. As is frequently the case with the blind, his senses of hearing and touch were extraordinarily acute, and he could carry on mentally long and intricate arithmetical or algebraical calculations. He devoted to his own use a purely arithmetic, the account of which is given in his elaborate *Elements of Algebra* (3 vols. 4to, Cambridge, 1740), which he did not live to publish. Of his other writings, prepared for the use of his pupils, the only one which has been published is *The Method of Fluxions* (1 vol. 8vo, London, 1766). At the end of this treatise there is given, in Latin, an explanation of the principal propositions of Sir Isaac Newton's philosophy.

SAURIANS See **REPTILES**

SAURIN, JACQUES (1677-1730), one of the group of great French preachers of the 17th century (see **FRANCE**, vol. ix. p. 682), was born at Nîmes on January 6th 1677, studied at Geneva, settled in London in 1701 as one of the pastors of the Walloon church, and died at The Hague, on December 30, 1730, whither he had gone to defend himself before the synod against a trumped-up charge of heterodoxy. Besides collections of *Sermons*, on miscellaneous texts, he wrote *Discours sur les événements les plus mémorables du Vieux et du Nouveau Testament* (Amsterdam, 1720-28), a work which, as continued by Beausobre and Roques, became popular under the name of *Saurin's Bible*.

SAUROPSIDA. This name was introduced by Huxley in his *Introduction to the Classification of Animals*, 1869, to designate a province of the *Vertebrata* formed by the union of the *Aves* with the *Reptilia*. In his *Elements of Comparative Anatomy*, 1864, he had used the term "Sauroids" for the same province. The five divisions of the *Vertebrata*—*Pisces*, *Amphibia*, *Reptilia*, *Aves*, and *Mammalia*—are all distinctly definable, but their relations to one another differ considerably in degree. The *Amphibia* are more similar to the *Pisces* than to any of the other divisions, and the *Aves* are closely allied to the *Reptilia*, and thus three provinces—*Ichthyopsida*, *Sauropsida*, and *Mammalia*—are formed.

The characters which distinguish the *Sauropsida*, that is, which are common to birds and reptiles, and not found combined in the other classes, have been thus summarized by Huxley—no

branchiae at any period of existence, a well-developed amnion and allantois present in the embryo, a mandible composed of many bones and articulated to the skull by a quadrate bone, nucleated blood-corpuscles, no separate parietal bone in the skull, and a single occipital condyle. In addition to these principal characters, others exist which are found in all birds and reptiles, but are not exclusively confined to them. The oviduct is always a Mullerian duct separate from the ovary and opening from the body cavity. The adult kidney is a metanephros with separate ureter, the mesonephros and mesonephric duct become in the adult male the efferent duct of the testis. The intestine and the reproductive and urinary ducts open into a common cloaca. There is usually an exoskeleton in the form of scales, in the birds the scales take the form of feathers. There are two aortic arches in reptiles, in birds only one, the right. The heart is usually trilocular, becoming quadrilocular in oodochiles and birds. In all the eggs are meroblastic and large, possessing a large quantity of yolk, in all the egg is provided in the oviduct with a layer of albumen and outside this with a horny or calcareous shell. In a few cases the egg is hatched in the oviduct, but in these cases there is no intimate contact between the embryo and the walls of the duct. Fertilization takes place internally, occurring at the upper end of the oviduct previously to the deposition of the albuminous layer and egg shell.

Comparative anatomy clearly shows that birds are reptiles which have become specialized in adaptation to the function of flight. This conclusion has been confirmed in the most surprisingly complete manner by the discovery of fossil forms intermediate between birds and reptiles. Two points of specialization in addition to the transformation of the fore limbs into wings are conspicuous in birds,—the reduction of the tail and the absence of teeth. *Archaeopteryx* is a flying feathered animal with a long reptilian tail. In the Rocky Mountain region numerous toothed birds have been recently discovered, and have been studied and described in a masterly fashion by Prof. O. C. Marsh. These forms belong to the Mesozoic period. For further details see **REPTILES** and **BIRDS**.

SAUSSURE, HORACE BÉNÉDICT DE (1740-1799), one of Switzerland's most celebrated physicists, was born in Geneva on February 17, 1740.¹ His youth was passed at his father's farm, where he early acquired a love for the study of nature. Following the example of his father and of his uncle Charles Bonnet, with whom he was associated in a research on the leaves of plants, he devoted himself at first to botany. Thus he was led to make the acquaintance of Haller, who was not long in discerning and appreciating his rare powers as an observer. In 1762, when only twenty-two years of age, Saussure was elected to the chair of philosophy at Geneva, where, along with another professor, he taught logic and physics alternately. But his natural leanings were all towards the study of external nature, and he took advantage of all available opportunities of travelling to thoroughly explore the mountains, valleys, and lakes of his native land, and to visit those of foreign countries, with the view of widening and deepening his conception of the constitution of the world. The Society of Arts of Geneva was founded by Saussure in 1772, and in 1774, at the invitation of the Government, he elaborated a plan for the reform of the system of teaching in his native town, but this was too radical in its nature to be adopted. In 1786 he resigned his professorship to his friend and fellow-worker Pictet. While honouring his country by his devotion to laborious scientific investigations, he exhibited his patriotism by

¹ His father, Nicolas de Saussure (1709-90), an agriculturist of unusually liberal opinions and wide sympathies, when a young man had applied himself to literary pursuits, and especially to the study of writings bearing on farming. He rendered all his life at his farm of Coudes, on the Arve, near Geneva. As a member of the council of Two Hundred he took part in public affairs. Most of his writings were of a practical character, bearing on the growth and diseases of grain and other farm produce. His last work, *On Fire, the Principle of Fecundity on Plants and of Fertility in the Earth*, published in 1782, was more speculative in its nature.

untiring diligence in the exercise of his duties as a member of the council of Two Hundred, and afterwards of the National Assembly. In consequence of over-exertion in this work his health began to fail in 1794, but, although deprived of the use of his limbs, he continued to revise the concluding volumes of his great work on Alpine physiography, which were published in 1796. Latterly his mind became enfeebled, and when he was offered a chair of philosophy by the French Government in 1798 he had lapsed into a condition of partial imbecility. He died on January 22, 1799, at the age of fifty-nine, leaving two sons and a daughter.

The Alps formed the centre of Saussure's investigations. They forced themselves on his attention as the grand key to the true theory of the earth, but, as year by year his mass of facts assumed ever-growing dimensions, his generalizations became more guarded, until finally he came to consider a simple recording of observations as the only justifiable course. As a young man he had roamed in search of plants through many remote valleys and over the "montagnes sauvages" as his unappreciative fellow-dwellers by the lakes called the snow-capped summits around them. It had been his dream, he says, since he was twenty to ascend Mont Blanc, and he accomplished the feat on 3d August 1787. This was the second time that the ascent of that mountain, until then deemed inaccessible, was made in that year.

Saussure found among the Alps opportunity for studying geology in a manner previously unattempted. The inclination of the strata, the nature of the rocks, the fossils, and the minerals received his closest attention. He acquired a thorough knowledge of the chemistry of the day, watching for the brilliant series of discoveries and the improvements in processes of analysis that brought the science into such dazzling prominence during the last quarter of the eighteenth century, and he applied all to the study of minerals, water, and air. Saussure's geological observations made him a firm believer in the Neptunian theory; he regarded all rocks and minerals as deposited from aqueous solution or suspension, and in view of this he attached much importance to the study of meteorological conditions. He earned barometers and boiling-point thermometers to the summits of the highest mountains, and estimated the relative humidity of the atmosphere at different heights, its temperature, the strength of solar radiation, the composition of air at great altitudes. Then, following the precepted moisture, he investigated the temperature of the earth at all depths to which he could drive his thermometer staves, the course, conditions, and temperature of streams, rivers, glaciers, and lakes, even of the sea. He invented a great number of instruments for these purposes, tested them, and investigated the theory of their action. The most beautiful and complete of his subsidiary researches is described in the *Essai sur l'Étiologie*, published in 1788. In it he records experiments made with various forms of hygrometer in all climates and at all temperatures, and supports the claims of his hair-hygrometer against all others. He invented and improved many kinds of apparatus, including the magnetometer, the cyanometer for estimating the blueness of the sky, the diaphanometer for judging of the clearness of the atmosphere, the anemometer, and the moulinet, or anemometer. His adaptations of the thermometer adapted that instrument to many purposes for ascertaining the temperature of the air he used one with a fine bulb hung in the shade or whirled by a string, the latter form being converted into an evaporimeter by inserting its bulb into a piece of wet sponge and making it revolve in a circle of known radius at a known rate, for experiments on the earth and in deep water he employed large thermometers wrapped in non-conducting coverings, and he rendered them extremely accurate and capable of long retaining the temperature once they had attained it. By the use of these instruments he showed that the bottom water of deep lakes is uniformly cold at all seasons, and that the annual heat wave takes six months to penetrate to a depth of 30 feet in the earth. He recognized the immense advantages to meteorology of high-level observing stations, and whenever it was practicable he arranged for simultaneous observations being made at different altitudes for as long periods as possible. It is perhaps as a geologist that Saussure worked most; he examined all the formations he met with much care and exactness, and although his ideas on matters of theory were in many cases very erroneous he was instrumental in greatly advancing that science.

Saussure's work is collected and summarized in his four large volumes of *Voyages dans les Alpes*. The book is arranged in the form of a narrative of the author's various journeys, interspersed with accounts of the observations made and descriptions of the apparatus employed. At the end there is a long list of "agenda," or subjects for investigation, which he anticipated would throw light on the theory of the earth. These agenda are of value as

exhibiting not only the scope and definite focussing of Saussure's mind but his almost prophetic foresight, since subsequent scientific work has advanced in each department very nearly on the lines there laid down.

His life was written by Senar in 1801, by Cuvier for the *Biographie Universelle*, and by De Candolle in *Revue Philosophique*, No. xv, translated in the *Philosophical Magazine*, [1] iv 93.

SAUSSURE, NICOLAS THÉODORE DE (1767–1845), eldest son of Horace Benedict de Saussure, was born on October 14, 1767, at Geneva, and is known chiefly for his work on the chemistry of vegetable physiology. He was a shy man, who lived quietly and avoided society; yet like his ancestors he was a member of the Genevan representative council, and gave much attention and thought to public affairs. He took a deep interest in the improvement of education, but deprecated the introduction of science teaching into schools, on the ground that it would divert the children's minds from the study of the classical languages and mathematics. He latterly became more of a recluse than ever, and died in April 1845.

When a young man Nicolas Théodore accompanied his father in the Alpine journeys and assisted him by the careful determination of many physical constants. He was attracted to chemistry by Lavoisier's brilliant conceptions, but he did not become great as an originator. He took a leading share in the rapid succession of improvements which rendered the processes of chemical analysis trustworthy. He fixed the composition of ethylic alcohol, ether, and some other commonly occurring substances, thereby advancing the knowledge of pure chemistry. He also studied fermentation, the conversion of starch into sugar, and many other processes of minor importance. The greater number of his 36 published papers dealt with the chemistry and physiology of plants, the nature of soils, and the conditions of vegetable life. These were published under the title *Recherches Chimiques sur la Végétation*, and were acknowledged to display remarkable ability.

SAVAGE, RICHARD (1697–1743), a mediocre poet and notorious literary character of the time of Pope, associated with Pope in the publication of the *Dunciad*. He had nearly reached the end of his career when Johnson went up to London, made his acquaintance, and was fascinated by his vivacity and knowledge of the world. After his death, Johnson gave his romantic history of himself in one of the most elaborate and best of the *Lives of the Poets*—a fine example of the great moralist's searching analysis and tolerant judgment of eccentric character. Johnson apparently accepted Savage's account of himself and his strange persecution by his alleged mother, the countess of Macclesfield, without hesitation, describing her as a "wretch who had, without scruple, proclaimed herself an adulteress, and who had first endeavoured to starve her son, then to transport him, and afterwards to hang him." Boswell was less credulous, made inquiries after his cautious manner in various quarters, and indicated pretty clearly that he considered Savage an impostor, although he could not explain why, if the unnatural story were not true, the countess could have allowed it to be put three times in print unchallenged during her lifetime (see Boswell's *Life*, chap. v). After Boswell, Malone and Bindley nibbled at the paradox, but it was not subjected to thorough examination till 1858, when Mr. Moy Thomas discovered the original manuscript depositions in the earl of Macclesfield's divorce suit at Doctors' Commons, and also the proceedings in the House of Lords. The results of Mr. Thomas's researches, prosecuted with rare acuteness and industry, appeared in *Notes and Queries*, November and December 1858. To Johnson's *Life* and these papers the reader may be referred for the strange story and the elaborate and complete exposure of its inconsistencies and improbabilities. The conclusion which Boswell hinted at, but was prevented by his reverence for Johnson from expressing, that Savage was an impostor, is irresistible.

SAVANNAH, a city of the United States, the capital of Chatham county, Georgia, and the largest city in the

State, is situated on the right or southern bank of the Savannah river, 13 miles in a straight line and 18 miles by water from the ocean. By rail it is 104 miles southwest of Charleston, S C. Stretching about three miles along the river, opposite Hutchinson's Island, and extending inland $1\frac{1}{2}$ miles, Savannah has an area of $3\frac{1}{2}$ square miles. The site is partly formed by a bold bluff of sand about a mile long, which lies 40 feet above low-water mark, ending abruptly at either extremity, but "slopes inland for several miles with a very gentle and regular declivity." Though laid out in parallelograms, Savannah has less than usual of the monotony of system, no fewer than twenty-four small public parks or gardens being distributed throughout the city, and most of its streets being well shaded with trees. In the south is Forsyth Park (30 acres), with a fountain after the model of that in the Place de la Concorde, Paris, and a monument to the memory of the Confederate slain. Johnson Square contains a Doric obelisk, in memory of General Nathaniel Greene and Count Pulaski, the corner stone of which was laid by Lafayette in 1825, and in Monterey Square, on the spot where Pulaski fell in 1779, rises a more elaborate monument—a statue of Liberty displaying the national banner, on the top of a marble shaft 55 feet high. The focus of commercial life in Savannah is the so-called Bay, a narrow street built at the foot of the river bluff, with its top stories opening on the higher level behind. Among the more conspicuous buildings are the custom-house and post office, the city exchange, the court-house, Oglethorpe United States barracks, Chatham academy, St Andrew's hall, the library hall of the Georgia Historical Society, the Savannah medical college, the Roman Catholic cathedral, and St John's Episcopal church. Besides being the second cotton port in the States, Savannah has a large trade in rice, timber, resin, and turpentine, the value of its exports being \$39,850,275 in 1873, and \$21,527,235 in 1880. Planning mills, foundries, and flour-mills are the chief industrial establishments. The harbour has in Tybee Roads a depth of 31 feet and 38 feet at mean low and high water, and the bar 19 and 26 feet. The population, 51,95 in 1810, was 51,312 in 1850, 28,235 in 1870, and 30,709 (15,654 coloured) in 1880.

Savannah was settled in February 1733 under General Oglethorpe. A British attack in 1776 was repulsed, but it was captured in 1778, and though the French and American forces made an attempt to recover it in 1779 it was held by the British till July 1783. The first session of the legislature of the State was held in Savannah in January 1784. A city charter was granted in 1789. A great fire in 1796 and another in 1820 did damage to the amount of \$1,000,000 and \$4,000,000 respectively. During the Civil War Savannah was held by the Confederates, but it was ultimately captured by General Sherman on 21st December 1864.

SAVARY, ANNE JEAN MARIE RENÉ (1774-1833), duke of Rovigo, was born at Maro, in the canton of Grandpré and department of Ardennes, on 26th April 1774. He was educated at the college of St Louis in Metz, where he gained a scholarship. When a youth of sixteen he became a volunteer in a cavalry regiment. His first military experiences were with the army of the Rhine under Custine, he distinguished himself under Moreau and Férno, and by 1797 had reached the rank of major. In the next year, under Desaix, he took part in the Egyptian expedition, and he followed the same general in the second Italian campaign, and at the great battle of Marengo (14th June 1800). He had by this time attracted the favourable notice of Napoleon, who detected not only his soldierly powers but his singular gifts in the region of diplomacy and intrigue. For Savary the plans and will of Napoleon formed a law which obliterated every other, and in presence of which political and moral scruple had no place. So early as 1800, while only twenty-six years of age, he was appointed a colonel and the commander of that legion

which was afterwards to form the picked bodyguard of the emperor. In 1803 he was general of brigade, and in 1804 he was charged with the execution of the Duc d'Enghien. Savary in his *Mémoires* (published in Paris in 1828, 8 vols 8vo) avows that all he did was to convey to Vincennes a letter whose contents he did not know, and early next morning, in obedience to the orders of a superior officer, to have the duke shot. The other side of the story is that he knew all about it,—that of set purpose, and in order to prevent an appeal to Napoleon's clemency, he hastened the execution, and it is certain that, unlike a man merely under orders, he himself went straight to Bonaparte to report the death. Savary was the hand which Napoleon employed in the delicate negotiations with the emperor Alexander about the time of the battle of Austerlitz in 1805. At Jena in 1806 he distinguished himself by his successful pursuit of the retreating Prussians, he rendered signal service by the siege of Hameln, which he forced to capitulate on 20th November, and, finally, the severe defeat which he inflicted upon the Russian forces at Ostrolenka, on 16th February 1807, was his crowning victory. Among other honours and rewards, he received a pension of 20,000 francs. After the peace of Tilsit he was despatched to St Petersburg, but shortly thereafter—the Napoleonic scheme for the crown of Spain being now apparently complete—he was recalled, was created duke of Rovigo, and started for Madrid. His deceitful intrigue was soon successful, and Joseph Bonaparte ascended the Spanish throne. From 1808 to 1810 he was again beside Napoleon in the many and changing scenes of his exploits, but on the 8th of June of the latter year France itself, now fully alive to the vast and mysterious power he had learned to wield, was startled by his appointment as successor to Fouché in the ministry of police. His administration, however, was not a success. After the overthrow of Napoleon, he desired to accompany his master to St Helena, but this was refused, and he was imprisoned at Malta. He escaped thence to Smyrna, thereafter wandered about the east of Europe, and finally embarked for England, which he reached in 1819. Three years before he had been condemned to death by default; and, learning this, he proceeded to Paris to clear himself of the sentence, in which he succeeded, being also reinvested with his rank and dignities. He retired to Rome, where he remained till 1831, when he was appointed commander-in-chief of the African army, and entrusted with the administration of Algeria. His duties were successfully performed, but he returned in March 1833 in weak health to Paris, where he died on the 2d of June.

SAVIGLIANO, a city of Italy, in the province of Cuneo, 31½ miles by rail south of Turin, lies in a plain between the Marra and the Mellas (head-streams of the Po) 1081 feet above the sea. It still retains some traces of its ancient walls, demolished in 1707, and has a fine collegiate church (San' Andrea, dating at least from the 11th century, but in its present form comparatively modern), a triumphal arch erected in honour of the marriage of Victor Amadeus I. with Christine of France, and in the Taftini palace paintings by the 16th-century local artist Giovanni Molinari (Mulinari, Il Caracano). Savigliano has long been a place of considerable industrial activity; its modern manufactures comprise paper, silk, and beer. The population was 9932 in 1881 (commune 17,150).

First mentioned in 981 as Villa Savilliani, Savigliano appears in the 12th century as a member of the Lombard league. Its name perpetually crops up in the history of Piedmont and Savoy. It was besieged and taken by the duke of Savoy in 1347 and again in 1367, and in the 16th and 17th centuries it suffered severely from French garrisons. Charles Emmanuel I died in 1630 at Savigliano, where the Piedmontese senate had met to escape the pestilence

SAVIGNY, FRIEDRICH CARL VON (1779-1861), was born at Frankfort-on-the-Main on February 21, 1779. He was descended from an ancient family, which figures in the history of Lorraine, and which derived its name from the castle of Savigny near Charmes in the valley of the Moselle. When Lorraine passed into the possession of France, his family attached itself to Germany, and his ancestors filled important official posts in Nassau and other German states. His great-grandfather wrote a work, *La Dissolution de la Réunion*, as a protest against the conquests of Louis XIV., his grandfather was "Regierungsdirector" at Zweibücken, and his father was a noble of the empire and "Kreisgesandter" of several princes of the diet of the circle of the Upper Rhine. His father, Carl Ludwig von Savigny, died in 1791, his mother in 1792, and he was brought up and educated by his guardian, Herr von Neurath, assessor of the Reichskammergericht or imperial chamber at Wetzlar, a master of the "Staatsrecht" of the time.

In 1795 Savigny went to study at Marburg, and derived great advantage, as is gratefully recorded by him, from the teaching and friendship of Professors Weis and Bauer. For six months he studied at Göttingen. It is noted as a curious circumstance that, though Hugo, the great civilian, was there lecturing, Savigny did not attend his course. He suffered much for two or three years from ill-health. Savigny visited, after the fashion of German students, Jena, Leipzig, and Halle, and he returned to Marburg, where, on December 31, 1800, he took his doctor's degree. His inaugural dissertation was entitled *De Concursu Delictorum Fœdali*.¹ At Marburg he lectured as privat-docent on criminal law, the pandects, the law of succession, obligations, and the methodology of law. In 1803 he published his famous treatise, *Das Recht des Besitzes*, or the right of possession. It was at once hailed by Thibaut as a masterpiece, jurists recognized that the old uncritical study of Roman law was at an end. It quickly obtained a European reputation, and still remains a prominent landmark in the history of jurisprudence. It was the fountain-head of a stream of literature which has not yet ceased to flow. Austin, no partial judge, pronounced it to be "of all books upon law, the most consummate and masterly." In 1804 Savigny married Kunigunde Brentano, the sister of Bettina von Arnim and Clemens Brentano the poet. In that year he visited Paris, chiefly with a view to make researches in the National Library into the life of the jurist Cujas, whom he greatly admired. In a letter to be found in his miscellaneous works he explains the ground of his admiration. "Dans l'histoire de la jurisprudence moderne, il n'y a pas d'époque plus brillante que celle du 16^{me} siècle. C'est alors que la science du droit eut véritablement un grand et noble caractère qu'elle n'a pas retrouvé depuis." A story not without significance as to his character relates to this period of his life. On his way to Paris, a box containing papers in which were the results of laborious researches was stolen from his carriage. He bore the loss with equanimity, and managed with the assistance of Jacob Grimm, his wife, and one of her sisters to do much to repair the loss.

In 1808 he was appointed by the Bavarian Government ordinary professor of Roman law at Landshut, where he remained a year and a half, and where he left many pleasant memories. In 1810 he was called, chiefly at the instance of Wilhelm von Humboldt, to Berlin to fill the chair of Roman law, and assist in organizing the new university. One of his services was to create, in con-

nexion with the law faculty, a "Spruch-Collegium," or university court, competent to deal with cases remitted to it by the ordinary courts, and he took an active part in its labours. This was the busiest time of his life. He was engaged in lecturing, in the government of the university (of which he was the third rector), and as tutor to the crown prince in Roman, criminal, and Prussian law. Not the least important consequence of his residence in Berlin was his friendship with Niebuhr and Eichhorn. In 1814 appeared his pamphlet *Vom Beruf unserer Zeit für Gesetzgebung und Rechtswissenschaft*. It was a protest against the demand for codification, and in particular against the extension of the Code Napoléon to Germany. Fired with the hope that a day of resurrection for the national life of Germany was at hand, Thibaut had written a pamphlet urging the necessity of forming a code for Germany. Savigny wrote a reply, in which were laid down some principles with which wise advocates of codification might well agree. "I regard," he said, "the law of each country as a member of its body, not as a garment merely which has been made to please the fancy, and can be taken off at pleasure and exchanged for another." He laid stress upon the connexion of the present and the past and the consequent limitations of the power of legislation. But in the course of his argument he confounded the errors of codifiers in France, Austria, and Prussia, and especially the defects in the Code Napoléon, with the necessary incidents of codification. Put at its highest, his argument comes to little more than others had before crudely expressed by saying, "We are not wise enough to compose a code."²

In 1815 he founded, with Eichhorn and Goschen, the *Zeitschrift für geschichtliche Rechtswissenschaft*, the organ of the new historical school, of which he was the representative. In 1816, while on his way to Rome as envoy of Prussia, Niebuhr made at Verona the celebrated discovery of the lost text of Gaius. He communicated to Savigny the fact, and also his conjecture that it was the work of Ulpian. Savigny made known the discovery to the world in an article in the *Zeitschrift*, and pointed out Gaius as the real author. Goschen, Bekker, and Hollweg actually deciphered the manuscript, but there is some truth in Hugo's saying, "Without Savigny one would not have had Gaius."

The record of the remainder of Savigny's life consists of little else than a list of the merited honours which he received at the hands of his sovereign, and of the works which he published with indefatigable activity.

In 1815 appeared the first volume of his *Geschichte des Römischen Rechts im Mittelalter*, the last did not appear until 1831. This work, to which his early instructor, Weis, had first prompted him, was originally intended to be a literary history of Roman law from Irenæus to the present time. His design was in some respect narrowed, in others it was widened. He saw fit not to continue the narrative beyond the 16th century, when the separation of nationalities disturbed the foundations of the science of law. His treatment of the subject was not merely that of a bibliographer, it was philosophical. It revealed the continuity in the history of Roman law, and it was an emphatic protest against the habit of viewing the law of a nation as an arbitrary creation, not connected with its history and condition. It was the parent of many valuable works which continued Savigny's investigations.³ In 1817 he was appointed a member of the commission for organizing the Prussian provincial estates, and also a member of the department of justice in the Staatsrath, and in 1819 he

¹ The object of his investigation is thus described: "Delicta concurrere dicuntur, ubi de pluribus legum violationibus, quarum nominis unus est reus, in eodem iudicio puniendus agitur."

² See Austin's criticisms in *Lectures*, ii. 698.

³ See Von Mohl's *Staatswissenschaft*, vol. iii. p. 55. For a somewhat less favourable view, see Gans's *Vermischte Schriften*.

became a member of the supreme court of cassation and revision for the Rhine Provinces. In 1820 he was made a member of the commission for revising the Prussian code. In 1822 a serious nervous illness attacked Savigny, and compelled him to seek relief in travel. He always considered that he had benefited much by the homeopathic treatment of Dr Necker, and he remained a firm believer in homeopathy. In 1835 he began his elaborate work on the modern system of Roman law. The eighth and last volume appeared in 1849.

In March 1842 he ceased to perform his duties as professor in order to become "Grosskanzler" of Prussia, and in that position he carried out several important law reforms in regard to bills of exchange and divorce (a subject on which he had meditated much). He held that office until 1848, when he resigned, not altogether to the regret of his friends, who had seen his energies withdrawn from jurisprudence without being able to flatter themselves that he was a great statesman. In 1850, on the occasion of the jubilee of his obtaining his doctor's degree, appeared in five volumes his *Vermaachte Schriften*, consisting of a collection of his minor works published between 1800 and 1844. This event gave rise to much enthusiasm throughout Germany in honour of "the great master" and founder of modern jurisprudence. Professor Scheurl, in his *Ewige Worte über Savigny*, notes the fact that on the 31st of October Luther first revealed to the world the light of evangelical truth, and Savigny on that day began his work as a law reformer. In 1853 he published his treatise on *Obligations*, a supplement to his system of modern Roman law. Savigny died at Berlin on October 25, 1861. His son, Carl Friedrich von Savigny, born September 19, 1814, was Prussian minister of foreign affairs in 1849. He represented Prussia in important diplomatic transactions, especially in 1866, and died February 11, 1875.

In the history of jurisprudence Savigny's great works are the *Recht des Besitzes* and the *Beruf unserer Zeit für Gesetzgebung*. The former marked an epoch in jurisprudence. Prof Ihering says "With the *Recht des Besitzes* was the juridical method of the Romans regained, and modern jurisprudence born." It marked a great advance both in results and method, and it rendered obsolete a large literature. Savigny sought to prove that in Roman law possession had always reference to usucapion or to interdicts, that it is not a right to continue in possession, but to immunity from violence, and that possession is based on the consciousness of unlimited power. These and other propositions were maintained with great acuteness and unequalled ingenuity in interpreting and harmonizing the Roman jurists. The book also seeks to solve the problem of general interest, common to almost every system of jurisprudence, why possession, rightful or wrongful, as distinguished from property, should be protected. This general problem suffers by being almost solely discussed with reference to Roman law. His leading principle, that every "exercise of force" is illegal, is not incontestable, and, if true, it does not clear up the whole problem. The attempt to trace the historical accidents of Roman law as juridical necessities at the weak side of a work in other respects masterly, and there is a difficulty in understanding Austin's eulogy that it was of all books he knew "the least alloyed with error and imperfection." The controversy which has been carried on in Germany by Ihering, Baron, Gans, and Bruns shows that many of Savigny's conclusions have not been accepted.¹ The *Beruf unserer Zeit* expresses the idea, unfamiliar in 1814, that law is part and parcel of the national life, and combats the notion, too much assumed by French jurists, especially in last century, and countenanced in practice by Bentham, that law might be arbitrarily imposed on a country irrespective of its state of civilization and past history. Of even greater value than his services in founding or consolidating "the historical school of jurisprudence" is the emphatic recognition in his works of the fact that the practice and theory of jurisprudence cannot be divorced without injury to both. Writing at a time when the influence of Hegel was in the ascendant, and in a city where he was official philosopher, Savigny was not carried away by metaphysical theories. In all his writings there is not a word betraying acquaintance with the labours of his great contemporary, Bentham, nor had Bentham more than the most superficial knowledge of the

him (see Gans's *Zusätze auf Personen*). Perhaps a study of both would do more than anything else to aid in the construction of a true science of jurisprudence, consisting neither of platitudes and logomachies nor of a worthless catalogue of legal curiosities. (J M)

SAVILLE See HALIFAX, vol xi p 386

SAVILLE, SIR HENRY (1549-1622), a learned Englishman, was the second son of Henry Savile, and was born at Over Bradley, near Halifax, Yorkshire, 30th November 1549. He entered Brasenose College, Oxford, whence he was elected to Merton College in 1561, where he took his degree in Arts and was chosen fellow. After graduating M.A. in 1570, he voluntarily read lectures on mathematics in the university. He was proctor in 1575 and 1576, travelled on the Continent collecting MSS in 1578, and on his return was tutor to Elizabeth in Greek and mathematics. He was warden of Merton College from 1585 until his death, and in 1596 was chosen provost of Eton College. He was offered preferment by James I. after his accession in 1604, but would accept nothing more than the honour of knighthood. After the death of his son Henry he devoted his fortune to the promotion of learning. In 1619 he founded lectures on mathematics and astronomy at Oxford, and he also made various other benefactions to the university, including the foundation of a mathematical library for the professors, and the gift of several rare MSS and printed books to the Bodleian. He died at Eton College 19th February 1622, and was buried in the chapel there. In recognition of his great services to the university, a public speech and verses were made in his praise, which were soon afterwards published under the title *Ultima Linæ Savilii*.

Savile was held in the highest esteem by all the learned of his time. He published *Four Books of the Histories of Cornelius Tacitus*, and the *Life of Agricola*, with Notes, dedicated to Queen Elizabeth (1581); *A View of Certain Military Matters, or Commentaries concerning Roman Warfare* (1568); *Latin Englishum Savilii et post Bodleum* (1596), an excellent edition of Crispianus, 8 vols. (1613); *Mathematical Lectures on Euclid's Elements* (1621); and *Oratio coram Elizabetha Regina Cæsaris habita anno 1592* (1598). In 1618 he published, with a Life, Bradwardine's work *De Causis Dei contra Pelagium et de Virtute Causarum*, and he translated into Latin King James's *Apology for the Oath of Allegiance*. He also left several manuscripts written by order of King James, all of which are in the Bodleian library.

SAVINGS BANKS (Fr *caisses d'épargne*, Germ *Spar-kassen*) are institutions for the purpose of receiving small deposits of money and investing them for the benefit of the depositors at compound interest. They are, in general, managed by benevolent persons, who seek no remuneration for their services. They originated in the latter part of the 18th century—a period marked by a great advance in the organization of provident habits in general (see FRIENDLY SOCIETIES). They had been, however, one of the many excellent projects suggested by Daniel Defoe in 1697. The earliest institution of the kind in Europe was one established at Brunswick in 1765, it was followed in 1778 by that of Hamburg, which still exists, in 1786 by one at Oldenburg, in 1790 by one at Loree, in 1792 by that of Basel, in 1794 by one at Geneva, which had but a short existence, and in 1796 by one at Kiel in Holstein. In Great Britain, in 1797, Jeremy Bentham revived Defoe's suggestion under the name of "Frugality Banks," and in 1799 the Rev Joseph Smith put it in action at Wendover. This was followed in 1801 by the addition of a savings bank to the friendly society which Mrs Priscilla Wakefield had established in 1798. Savings banks were shortly after established in London, Bath, Routhwell in Dumfriesshire, Edinburgh, Kelso, Hawick, Southampton, and many other places. By 1817 they had become numerous enough to claim the attention of the legislature, and Acts of Parliament were passed for their management and control. Their progress in the United Kingdom since that date is shown by the following statement:—

¹ See Windscheid, *Lehrbuch des Pandektenrechts*, 1. 489.

Year ending Nov. 20	Population	Number of Depositors	Percentage of Population	Amount of Deposits	Per Head of Population
				£	£ s d
1821	20,893,584	Not Known		4,740,188	0 4 6
1831	24,028,584	429,400	2	14,698,635	0 12 3
1841	26,730,020	841,204	3	24,536,971	0 18 4
1851	27,890,029	1,161,838	4	30,445,568	1 2 3
1861	28,927,455	1,609,102	6	41,542,219	1 8 9

From this date the progress of the post office savings banks has also to be brought into account, statistics of which have already been given under Post Office —

Year	Population	Number of Depositors			Percentage of Population
		Trustee Savings Banks	Post Office Savings Banks	Total	
1871	31,845,879	1,404,078	1,803,492	2,707,570	8 1
1881	35,341,482	1,552,486	2,907,018	4,140,008	12
1884		1,552,474	3,333,675	4,916,149	

Year	Amount of Deposits			Per Head of Population	Per Depositor
	Trustee Savings Banks	Post Office Savings Banks	Total		
	£	£	£	£ s d	
1871	38,820,458	17,025,004	55,845,462	1 15 0	21
1881	44,137,855	36,194,495	80,332,350	2 5 7	19
1884	45,840,887	44,773,778	90,614,660		18

On the 24th April 1886 the funds in the hands of the National Debt Commissioners on account of trustee savings banks were £46,162,515, and post office savings banks £49,881,896, a total of £96,044,411

To these may be added the cash and assets in the hands of the banks and the postmaster-general, which at the beginning of the previous year amounted to £764,804, and also the following investments in stock on account of depositors — trustee savings bank, £729,522, post office savings bank, £2,628,928, total, £3,358,450, —making the aggregate funds belonging to depositors in savings banks more than £100,000,000

The largest savings bank in the United Kingdom is that at Glasgow, as shown by the following table of the 21 principal banks —

	Deposits on 20th November 1884	Deposits Accounts Open	Number of Transactions in the Year
	£		
Glasgow	8,666,607	127,651	523,322
Liverpool	2,080,788	80,667	336,281
Manchester	1,858,468	68,162	210,828
Edinburgh	1,412,547	59,970	233,375
St Martin's Place, London	1,351,839	29,999	38,350
Bloomfield Street, London	1,263,477	65,801	104,311
Exeter	1,054,001	34,217	35,280
Sheffield	917,164	32,389	74,150
Finsbury, London	885,195	31,880	27,366
Newcastle-on-Tyne	776,138	21,998	40,952
Preston	652,875	19,561	54,871
Hull	628,903	27,597	82,414
Nottingham	607,708	23,511	40,114
Leeds	572,509	24,822	38,433
Bristol	559,095	14,168	29,286
Devonport	525,154	16,995	23,075
Bloomsbury, London	521,515	23,582	39,438
	19,874,133	703,220	2,046,416
Banks with less capital but a large number of depositors —			
Aberdeen	396,151	32,668	36,380
Dundee	474,089	22,119	31,753
Marjebone, London	301,718	22,589	27,773
Leicester	323,296	18,581	36,141
	20,872,382	797,438	2,224,463

From this table some interesting conclusions may be drawn as to the operations of savings banks in the larger towns. These 21 banks have together more than 50 per cent of the depositors, more than 45 per cent of the deposits, and more than 65 per cent of the transactions of all the 411 savings banks of the United Kingdom

The progress of savings banks and the large amount of organization that the deposits have now reached are evidence of the general fitness of the organization for its purpose. So far as regards trustee savings banks, the provisions of the Acts of 1817 are still to a great extent the same as those by which they are now regulated, though the law has been frequently amended in matters of detail, and twice (1828 and 1863) consolidated. Its main feature is the requirement that the whole of the funds should be invested with the Government through the Commissioners for the Reduction of the National Debt. The local management of the banks has been left entirely to the trustees, who are precluded from receiving any remuneration for their services or making any profit. They are, however, required to furnish the commissioners with periodical returns of their transactions. This blending of private management with state control has had many advantages in knitting together class and class, and in many places the voluntary trustees and managers have been able to render real service to the depositors in various ways. A new savings bank requires for its establishment the consent of the National Debt Commissioners and the certificate of the registrar of friendly societies to its rules, but since the opening of the post office savings banks in 1861 few have been established, and many old savings banks have been closed, not being able to offer to their depositors the same advantages as the new system. The savings banks, which numbered 640 in 1861, have thus been reduced to 411, and then capital has been maintained rather by the accumulation of interest than by fresh deposits.

The legislation of 1817, among other inducements to thrift, Interest. offered that of a bounty to the savings bank depositor in the shape of a rate of interest in excess of that given to the ordinary public creditor, or — which is the same thing — in excess of that which could be earned by the investment of the deposits in the purchase of Government stock. The interest offered in the first instance was 3d per day, or £4, 11s 8d per cent per annum, and that rate continued to be granted until the passing of the Act of 1828 (9 Geo IV c 92). That Act reduced the rate of interest allowed to the trustees of savings banks to 2d per day, or £3, 16s 0d per annum, and prohibited them from allowing more to their depositors than 2d per day, or £3, 8s 8d per annum, requiring them to pay the surplus, if any, into a separate fund held by the National Debt Commissioners, but bearing no interest. In 1844 the interest to trustees was further reduced to 2d per day, or £3, 5s per cent, the maximum to be allowed to depositors being fixed at £3, 0s 10d. Finally, in 1880 the interest to trustees has been reduced to £3, and that to depositors to £2, 15s.

The result of the bonus on thrift offered by the earlier statutes was a loss to the state, which ought to have been made good by an annual vote. Between 1817 and 1828 the difference between the interest credited and that earned amounted to £744,968, and this led to the reduction in the rate of interest effected by the Act of the latter year. The deficiency, instead of being paid off, was allowed still to accumulate, and as the price of stock rose and the deposits increased fresh deficiencies arose, so that by 1844 the deficiency, which would have been 1½ millions by the mere accumulation of interest on the previous £744,968, had become £3,179,800. The reduction of interest in 1844 was about enough to make the fund self-supporting, though savings banks are always, as Mr. Scatchell clearly shows, liable to loss from the fact that deposits are in excess when the funds are high and withdrawals when they are low, but the past deficiency was still allowed to accumulate, and it was not till 1880 that the plan was adopted of voting the deficiency every year. Had the accumulated deficiency been then liquidated, there would have been no necessity for an annual vote. The bad political economy of the legislators of 1817 has left us this legacy of annual deficits. Had they provided the bounty at their own expense instead of that of their descendants, there would have been little to be said against it.

Limitation of deposits. The offer of a bonus on thrift was of necessity accompanied by provisions to guard against its being used by others than the classes it was intended to encourage. This was done by limiting the amount that each depositor should be permitted to pay in. In the first instance, England the limit was fixed at £100 for the first year, and £50 a year afterwards. In 1834 these limits were reduced to £50 for the first year, £20 a year afterwards, and £200 in the whole. In 1838 the limit was adopted which still remains in force of £30 a year or £150 in the whole, allowed by addition of interest to increase to £200 but no further. Attempts have been frequently made to raise the annual limit to £50, but have always been defeated. Thus it is to be regretted, for the limit is of doubtful utility, now that the use of interest has been so reduced as to prevent loss to the state. It is within the common experience of savings banks managers that persons come to deposit an amount exceeding £30 and are disappointed when they find they cannot do so. The Act of 1832, permitting investment in Government stock, may diminish the mischief.

Occupations of depositors. With the view of showing to what extent savings banks are used by the classes for which they were intended, a return was published for the year 1852, showing (as nearly as could be ascertained) the number of depositors belonging to various occupations, and the amount of their deposits, as follows:—

	Depositors	Deposits	Average
Tradesmen and their assistants, small farmers, clerks, mechanics, and all names not described as journey-men, and their wives	206,407	£28,144,900	£27
Domestic servants, charwomen, nurses, and landresses	257,711	6,907,888	27
Minors having accounts in their own names, including apprentices	162,496	2,436,191	15
Labourers, farm servants, journey-men mechanics, and their wives	152,067	4,254,060	29
Females described only as married women, widows, or spinners	138,868	4,937,458	39
Dressmakers, milliners, shopwomen, and female artisans	24,859	680,502	23
Trust accounts (principally for minors), including all joint accounts	22,847	417,756	19
Soldiers, sailors, boatmen, fishermen, policemen, letter carriers, revenue officers, postmen, railway men, and their wives	21,623	759,248	31
Persons engaged in education, male and female	10,497	327,705	21
Gentlemen, persons of independent means, professional men, and their wives	20,861	579,628	28
Miscellaneous, and persons without any given description	60,280	1,384,851	23
Total	1,188,147	£24,908,227	£25

Not two per cent of the deposits, therefore, either in number or amount, are made by classes whom it may be supposed it was the intention of the legislature to exclude.

Depositor's declaration. When a person comes with his first deposit to a savings bank he is required to sign a declaration, setting forth his name, address, and occupation, that he desires to become a depositor on his own account, and that he has no money in any other savings bank. If this declaration be not true, the deposits are liable to be forfeited, but it is to be feared that few depositors take the trouble to read what they are signing, or think much about the meaning of it. If the depositor cannot write, the actuary of the savings bank will usually ask him a few questions, such as his age, mother's maiden name, &c., which may tend to identify him, or defeat any attempt to perjure him for the purpose of withdrawal. The enactment that deposits are to be forfeited if the declaration be false was qualified in 1868 by a provision that the forfeiture should not be enforced unless in the opinion of the appointed barrister (now the solicitor to the treasury) the deposits had been made with a fraudulent intention.

Fraudulent deposits. The consequence of the determination by the solicitor to the treasury that the deposits have been made with the "fraudulent" intention which the Act contemplates is out of all proportion to the nature of the offence committed, being in fact the forfeiture of all the deposits. The prohibition of double deposits arose when the state was granting a rate of interest greater than that which it earned upon the investment of the money, and it has now ceased to have any real reason whatever, the rate of interest being less than earned. The intention to "defraud" now means merely the intention to evade a restriction that has ceased to be necessary, not an intention to deprive anybody of anything that belongs to him. If it be thought desirable to sanction by the infliction of a penalty the law that these institutions should be used only for the savings of the poorer classes, the loss of interest would be a sufficient if not an extravagant penalty, without forfeiture of the principal. Indeed, the present excessive penalty has, in no remarkable case, defeated itself. This was the case of a depositor in an Irish savings bank, who invested in fictitious names the sum of £2000. The solicitor to the treasury felt compelled to declare

that these deposits were made with a fraudulent intention. The registrar in Ireland felt bound to act on this determination, and refused to award payment of the deposits. The High Court of Justice and the Court of Appeal refused to grant a mandamus, for the law could not assist a wrongdoer. But parliament itself voted £1000, or half the amount of the forfeiture, the legislature thus providing a remedy for an injustice it had itself committed. Another curious case was that of a young woman, the daughter of a postmaster, in who order that her father might be provided with funds to meet business claims as they became due, pillooned money from him and invested it in false names in the post office savings bank kept at his house. In this case, the postmaster himself not being the guilty party, no forfeiture took place.

Among the benefits conferred by the legislative upon depositors Settlement in savings banks has been that of exemption from the jurisdiction ment of the ordinary courts of law in cases of dispute with the trustees deposited. By the Acts of 1817 disputes were to be settled by arbitration. By that of 1828 the barrister appointed to certify the rules of the savings banks (then and until his death in 1870 Mr John Tidd Pratt) was made amenable in case of difference of opinion between the arbitrators. By that of 1844 the arbitrators were abolished, and an original and final jurisdiction was conferred upon the barrister. By an Act of 1876 the functions of the barrister in this respect were conferred upon the registrar of friendly societies. This in effect makes no change in the law, for the offices of barrister and registrar have been always held by the same persons. As early as 1852 it was determined in the case of *Crisp v. Sir Henry Bumbay* that the effect of these enactments was to vest the jurisdiction of all the superior courts of law and equity, and the authority of that decision has never been shaken or even doubted.

Since 1876 the registrar of friendly societies has made 147 judgments in cases of disputes with savings banks, in addition to 169 decisions on disputes with the post office savings bank. As the writer of registrar the present article is one of the two persons in whom the jurisdiction is vested for England, he hopes to have been very successful in expressing the opinion that his exercise has been highly beneficial to depositors in savings banks. The costs of the award are limited by treasury warrant to a few shillings, never exceeding £1. The procedure is simple and elastic, and the results are believed to be satisfactory. The central office, acting as registrar, determines law and fact, and adjusts all the claims of each case. References to the index to the registrar's decisions applied to the chief registrar's report for 1883, or to Mr Forbes's useful work, will show that many interesting questions of law have had to be determined with regard to so small a matter as the ownership of a savings bank deposit.

Questions between husband and wife as to property including Other deposits in savings banks as now, under the Married Woman's Property Act, settled by the judges of the ordinary courts. Where a depositor, as often happens, is of illegitimate birth, a special provision is made by the Savings Bank Act in favour of his relatives, to whom the solicitor to the treasury may award his deposits. It is open to any depositor to nominate a person to whom the amount due to him at his death shall be payable, provided it does not exceed £100 and the nominee is not an officer or servant of the bank, unless indeed such officer or servant is appointed to the depositor. This privilege, derived from the Provident Nominations and Small Intestates Act passed in 1868, is not yet sufficiently known to the bulk of depositors, and has not been used to any large extent, but may be expected in time to become very valuable. It is an extension of a privilege enjoyed by members of friendly societies since 1856, and also by industrial and provident societies and trade unions.

A painful chapter in the history of savings banks is that frauds occupied by the frauds of actuaries, which have caused losses to actuaries of depositors of not less than £150,000. It too often happens that, where the only supervision is that of honorary officers, a paid servant may commit frauds unchecked over a long period of time. In the case of a savings bank at Rochdale, £71,715 was stolen by the actuary, and £87,438 of this loss had to be borne by the depositors. In one at Dublin the loss was £55,000, and in one at Tulse £36,000. These unhappy events must have greatly discouraged the poor, and checked the progress of savings banks. There is, however, the compensating fact that the savings made by the people of Rochdale since 1849, when the savings bank there was closed, have taken the more favourable direction of promoting the great co-operative enterprises of that town. Savings banks, valuable and important as their benefits are, are still only elementary teachers of providence, and it is well for the workman to learn not merely to save money but to employ his savings to advantage. The stringent legislation as to audit of 1868 has diminished frauds on savings banks, and they are now rarely heard of.¹

In connection with savings banks, and as auxiliaries to them, are Penny penny banks. An ordinary savings bank will not accept a deposit banks.

¹ Since the above was written the disclosure of frauds of long standing in the Cardiff savings bank has taken place.

of less than 1s (or in some cases 5s) on account of the expense of management. It seems to have occurred to Dr Chalmers to supplement the work of the Edinburgh Old Savings Bank by establishing in a Free Church congregation in Edinburgh a bank, managed entirely by voluntary agency, in which a deposit of 1d or 6d, or any sum not exceeding 10s, would be received. When the deposit amounted to £1, the owner was requested to transfer it to the savings bank, and the funds were invested with the savings bank to the extent of £100 a year or £300 in the whole. Similar banks, called "territorial savings banks," were established in other congregations. An organization of penny banks has existed in Glasgow for thirty years, and another has been set on foot in Liverpool by the exertions of Mr T. Banner Newton, the able secretary of the savings bank there. On 31st November 1885 there were 173 such banks open in Liverpool, with 17,492 depositors. When a deposit reaches £1 it is transferred to the depositor's credit in the Liverpool Savings Bank. The amounts thus transferred were £56,122, and £34,332 remained to the credit of depositors in the penny banks. The transactions of the year numbered 677,686 and amounted to £42,194. Penny banks require no certificates from the registrar or other legal organization, but if they desire to deposit more than the limit above mentioned the permission of the National Debt Commissioners must first be obtained.

Army Savings banks for the army were established in 1842, and are now regulated by Acts of Parliament—22 and 23 Vict. c. 30 (1859), savings 26 and 27 Vict. c. 12 (1863), for the Royal Navy and Marines by 17 and 18 Vict. c. 48 (1856), and for seamen generally by 17 and 18 Vict. c. 304, § 180 (1854), 13 and 19 Vict. c. 91, § 817 (1855), and 19 and 20 Vict. c. 41 (1856). Into these, or added into any trustee or post office savings bank, seamen's wages may be paid under allotment notes by 43 and 44 Vict. c. 16, § 3 and sch 1 (1880). The amounts in the hands of the National Debt Commissioners belonging to depositors in savings banks of these various classes at 28th September 1885^a were—

Military savings banks	£285,631
Naval savings banks	175,445
Seamen's savings banks	138,616

Total £599,692

Private Voluntary savings banks, unconnected with the Government, have also been established, the most important of which are the Yorkshire Penny Bank and the National Penny Bank. The depositors in these rely solely on the character of the persons by whom they are managed, and in some institutions of the kind have met with severe disappointment in consequence. As they are under no responsibility to the State, these institutions make no returns to parliament, and no trustworthy information as to the extent of their operations can be given.

Railway savings banks The railway companies, which are private corporations empowered by special Acts of Parliament, have in several cases availed themselves of these Acts to take power for establishing savings banks for the benefit of their servants. The Manchester, Sheffield, and Lincolnshire Railway Savings Bank has been established 25 years, and has 5449 depositors, whose accounts amounted on 31st March 1885 to £249,322, 15 transactions for the year were £28,702 deposits, £33,755 withdrawals, in number 26,596. Six other railway companies have submitted the rules of their savings banks to the registrar of friendly societies in pursuance of their private Acts, and the aggregate of their annual returns for the year 1884-5 is as follows—

Deposits during the year	£171,246
Repayments	£111,369
Balance due to depositors	£661,177
Number of depositors	8,720
Increase during the year	7,749
Number of transactions (estimated)	61,621
Interest credited	£24,053

In addition, five other banks had been established by railway companies without reference to the registrar, and these in 1876 received £72,555 deposits and had 412 depositors. The total deposits in railway savings banks may therefore be estimated at a million sterling.

Australia—British Colonies.—The thirteen savings banks in the colony of Victoria had on the 31 December 1882 a capital of £1,970,555. In the following year, however, the withdrawals exceeded the deposits, reducing the deposits to £1,785,990. The number of depositors, however, has steadily increased from 24,187 in 1873 to 70,844 in 1883. Of these 89,404 were males and 80,950 females, 1618 depositors had balances over £200, amounting to £407,632. The transactions of the year 1883 were—deposits, £1,357,078, withdrawals, £1,610,576. The deposits in the post office savings banks of Victoria also reached their highest amount in 1883, when they were £1,150,891, falling in 1883 to £1,082,132. In this also the number of depositors has steadily increased from 34,360

in 1873 to 65,735 in 1883. Their transactions for the year 1883 were—deposits, £724,028, withdrawals, £842,288. Taking the two classes of savings banks together, the number of depositors on 31st December 1883 was 136,089, the amount of capital £2,618,122, and the average for each depositor £20, 14s. The number of depositors per cent of the population was 15. The rate of interest given to depositors is 4 per cent. The savings bank of Melbourne alone had, on the 30th June 1885, deposits amounting to £1,235,753, belonging to 38,129 depositors. The transactions averaged 1078 per diem.

In New South Wales the depositors in June 1883 were 66,604 or 8 per cent of the population, and the deposits £2,895,555 or £42 per depositor, the rate of interest being 4 per cent in the post office savings bank and 5 and 6 per cent in other banks.

In Queensland the depositors were 26,642 or 10 per cent of the population, and the deposits £1,086,685 or £41 per depositor, the rates of interest being 4 and 5 per cent.

In South Australia the depositors were 46,358 or nearly 16 per cent of the population, and the deposits £1,500,249 or £32 per depositor, the rate of interest being 4½ per cent.

In Western Australia, on the 31st December 1883, there were 1904 depositors or 6 per cent of the population, having £24,388 deposits or £13 each.

In Tasmania the depositors in June 1883 were 17,281 or 14 per cent of the population, and their deposits £380,848 or £22 each, the rate of interest being 3½ per cent in the postal banks, and slightly higher in the general savings bank.

In New Zealand the depositors were 69,986 or 13 per cent of the population, and their deposits £1,637,739 or £24 each. The rate of interest is from 4 to 5 per cent.

The general total for the Australian colonies is 365,828 depositors or 12 per cent of the population, and £10,304,145 deposits, which is £28 on the average for each depositor.

In the Dominion of Canada, according to a paper read at the Canada Montreal meeting of the British Association by Mr J. C. Stewart, the old established savings banks in the cities of Montreal and Quebec have £2,000,000 sterling, belonging to 42,267 depositors; the post office savings banks established in 1868 have £2,650,000, belonging to 66,683 depositors, and the chartered banks also receive deposits on the savings bank system.

United States.—According to the report for 1884 of Mr Henry W. United Cannon, comptroller of the treasury, these were on the 30th November 1883 in the United States of America forty-two savings banks, with capital amounting to £300,000 (£86-2½) and having £3,000,000 deposits, and 625 savings banks without capital having £192,000,000 deposits. In the six years 1876-82 the number of savings banks with capital had increased from twenty-six to forty-two, but their capital had diminished 30 per cent, while their deposits had increased 16 per cent. On the other hand, the number of savings banks without capital had diminished from 691 to 625, but their deposits had increased 14 per cent. Of the aggregate deposits the 422 savings banks in the New England States held £87,500,000, the 179 in the Middle States £98,500,000, the 9 in the Southern States £660,000, and the 57 in the Western States and Territories £14,000,000. In the latter two groups the banks with and without capital are nearly equal in number and in the amount of deposits, in the former two groups banks with capital are the exception, being only one in sixty of the whole.

Savings banks in the United States differ from those in the United Kingdom in the manner in which their funds are invested, not being limited to Government securities. Thus, of the 200 millions sterling of deposits only 46 millions was invested in United States bonds, viz, New England, £6,900,000, Middle States, £36,800,000, Western States, £400,000, Pacific States and Territories, £2,900,000.

A statement of the aggregate resources and liabilities of 635 savings banks in 1884 (£236,000,000) is furnished, showing—

Deposits	£215,000,000
Surplus fund	17,000,000
Undivided profits	8,000,000
Other liabilities	1,000,000
Provided for as follows—	
Loans on real estate	72,000,000
Loans on personal and collateral security	28,000,000
United States bonds	39,000,000
State, municipal, and other bonds and stocks	44,000,000
Railroad bonds and stocks	10,000,000
Bank stock	8,000,000
Real estates	1,000,000
Other assets	14,000,000
Due from banks	11,000,000
Cash	8,000,000

According to the report of the comptroller for 1885 (which has reached us since the above was written) the deposits have increased during the year to £220,000,000, and the total assets to £240,000,000.

^a For this information we are indebted to the authorities of the National Debt Office.

In New England the depositors number 56 in every 100 of the population, and the average amount of each account is £66, or £24 for each individual if distributed over the entire population. In New York State the deposits would give £17 per head if distributed in like manner.

The following table gives for each State the number of depositors, and the amount and average of deposits, in 1855

State	Depositors	Deposits	Average
Maine	106,000	£5,500,000	£22
New Hampshire	121,000	8,700,000	73
Vermont	39,000	2,200,000	57
Massachusetts	826,000	52,500,000	63
Rhode Island	116,000	10,200,000	88
Connecticut	252,000	18,100,000	71
New York	1,165,000	87,400,000	75
New Jersey	87,000	4,800,000	55
Pennsylvania	196,000	7,000,000	52
Maryland	78,000	5,700,000	73
District of Columbia	7,000	100,000	20
Ohio	35,000	2,500,000	63
Indiana	9,000	400,000	48
Minnesota	12,000	600,000	53
California	82,000	11,700,000	142
	8,071,000	218,400,000	71

Brazil—The savings banks of the empire of Brazil have been made instruments in the gradual extinction of slavery in that country. Since 1871 each slave is allowed certain hours a week to labour for his own benefit, and when his earnings deposited in the savings bank amount to a given sum the remainder of the price of his emancipation is provided by the state out of public funds. The children of slave mothers, who since 1871 have been born free, are also encouraged to place their earnings in school savings banks. By a law passed on the 14th August 1855, immediate enfranchisement at the cost of the state is conferred upon slaves employed in agricultural establishments, upon condition of their remaining with the master at fixed wages for five years and paying half the wages into the savings bank towards repayment of the price paid for their freedom.

Continents of Europe—In several of the countries of Europe savings banks have been established and are flourishing. In Prussia the first savings bank was founded by the municipality of Berlin in 1828. In 1838 they were taken under the supervision of the Government. Their formation has been much aided by an association called the "Central Union" for the good of the industrious classes. A great variety of investments is permitted. In 1874 there were 878 banks, having 2,959,000 depositors and £49,915,000 of deposits, being a little over £2 per head of the population. Besides savings banks, there are the credit banks established by the late Herr Schultz-Deitseh, which perform a similar function.

In France 79 per cent of the deposits are invested in the public debt, on which interest at the rate of 4 per cent is guaranteed, but the savings banks are private institutions, 19 per cent are invested in mortgages and 2 per cent on municipal securities. Post office savings banks also exist. The average amount of each deposit account is smaller than in England, 79 per cent of the deposits being under £20 as against 63 per cent. The following statement shows the progress of savings banks in France since their first regulation by law in 1835—

Date	Number of Banks, including Branches	Number of Depositors	Per cent of Population	Amount of Deposits	Per Head of Population
				£	s d
31st Dec. 1840	430	351,808	1	7,695,293	4 6
" 1850	540	555,995	2	5,572,738	3 1
" 1860	638	1,212,122	3	15,054,184	8 3
" 1870	1121	2,079,141	5	25,580,000	-
" 1878	1520	3,175,721	9	46,946,556	22 0

The depositors now number nearly five millions. Savings banks were greatly affected by the Revolution of 1848 and by the Franco-German War. Previous to the former event, the deposits had risen on 31st December 1845 to £15,822,164, falling on 31st December 1849 as low as £2,965,802. In the early part of 1870 they had risen to £25,806,000 or 15s for every individual of the population. The separation of Alsace and Lorraine reduced the deposits. Postal savings banks were established in 1875, but only as auxiliaries of the ordinary savings banks, school savings banks, mainly through the enlightened exertions of M de Malraux, were commenced in 1874. These are now established in 23,252 schools, have 468,674 depositors and £451,402 deposits—A national

postal savings bank was instituted on 9th April 1881, and was extended to Corsica on 1st March 1882 and to Algeria and Tunis from 1st April 1884. On 31st December 1883 it had already 374,970 depositors and £3,097,200 deposits. The Paris savings bank had on 31st December 1882 440,728 depositors and £3,513,483 deposits.

In Italy at the end of 1872, 282 savings banks were in existence, Italy of which 142 were principal banks and the rest branches. With two exceptions, all are managed without profit to the promoters or guarantors. In 1826 there were 11 savings banks in which £108,000 had been deposited, in 1850 the deposits amounted to £1,600,000, and in 1872 to £17,860,000, belonging to 876,327 depositors. Of these funds, 21 per cent was invested on mortgages, 10 per cent only in the public debt, 11 per cent in obligations of local authorities, 12 per cent in shares and bonds of companies, 16 per cent in bills of exchange, 15 per cent in loans on public funds and commercial securities, 11 per cent in current accounts, and 4 per cent otherwise. The average rate of interest allowed to depositors is 4½ per cent. The transactions of the year were—deposits £7,911,000, withdrawals £6,514,000. The system of school savings banks has been adopted in many communes. In addition, deposits are made in popular banks and other establishments of credit, and post office savings banks have also been established.

In Denmark savings banks are private institutions, but must Denmark not be managed for profit, nor invest in foreign securities, and they are required to make annual returns to Government. In 1860 the amount of deposits was £3,221,000, by 1871 it had increased to £3,661,031, and by 31st March 1881 to £13,747,621. The savings banks have increased in number during the ten years from 188 to 446, and the depositors from 285,991 to 492,256. Twenty-six banks have more than £100,000 deposits. The oldest and largest is that of Copenhagen, established 1st May 1820, having £2,820,892 deposited, which has increased from £232,874 in the ten years. The number of depositors has increased from one six to one in four of the population, and the deposits from £8, 14s 8d to £26, 9s per head of the population. The transactions of the year ending 31st March 1881 were—deposits £2,141,627, withdrawals £6,702,470. Of the deposit accounts, 74 per cent are under £28 and 15 per cent above £23 and under £43. One half of the funds are invested on mortgage. The reserve funds of the banks had increased in ten years from £226,829 to £665,597.

The following are statistics of savings banks in other European countries as published by the Italian Government a few years ago—

Country	Population	Number of Banks	Number of Deposit Accounts on 1st January	Amount of Deposits on 1st January	Europe
Belgium (1874)	5,336,000	10	132,000	£2,510,000	
Austria (1874) (Gis- Leithan provinces)	21,806,000	275	1,269,000	68,981,000	
Hungary (1878)	15,417,000	232	1,015,000	15,209,000	
Saxony (1872)	2,556,000	166	517,000	11,445,000	
Thuringia (1878)	899,000	7	83,000	1,897,000	
Mecklenburg (1872)	557,000	81	91,000	1,072,000	
Hamburg (1874)	370,000	8	81,000	1,616,000	
Bremen (1878)	135,000	4	45,000	2,404,000	
Lubeck (1878)	62,000	2	14,000	1,400,000	
Bavaria (1869)	4,824,000	293	279,000	2,490,000	
Wurttemberg (1874)	1,818,000	121	102,000	2,766,000	
Baden (1874)	1,461,000	99	141,000	4,142,000	
Alsace and Lorraine (1872)	1,549,000		41,000	288,000	
Holland (1872)	3,679,000	240	99,000	1,127,000	
Sweden (1872)	4,297,000	271	553,000	6,036,000	
Norway (1872)	1,760,000	269	226,000	5,201,000	
Switzerland (1872)	2,693,000	312	542,000	11,581,000	
Russia (1872) (Ger- man governments only)	56,408,000		71,000	785,000	
Finland (1872)	1,838,000	86	18,000	846,000	
	126,881,000	2376	4,159,000	123,928,000	

M de Malraux has obtained for the *Dictionnaire des Finances* Agree- some more recent statistics, the details of which have not yet been reached us, but from information he has been so good as to communicate we infer an increase in deposits during the last 10 years in twelve European states of £123,000,000,—making the aggregate of savings bank deposits for all countries, as far as ascertained, £728,000,000. (E. W. B.)

SAVOIE, a department of south-eastern France, formed in 1860 of the districts of Upper Savoy, Savoy proper, Tarentaise, and Maurienne, which formed the southern part of the province of Savoy in the kingdom of Sardina.

Situated between 45° 5' and 45° 55' N lat and between 5° 37' and 7° 5' E long, it is bounded N by the department of Haute-Savoie, N W by Ain, W by Isère, S by Hautes-Alpes, and S E and E by Piedmont (Italy), the limits for the most part consisting of ridges of the Alps, and on the N W, being determined by the Rhone and its affluents the Fier and the Guier. The highest point in the Vanouse group of mountains is 12,668 feet above the sea, while the Rhone leaves the department at a height of 695 feet, and the Isère about 800. Some details in regard to the orography will be found under ALPS (*qv*). The Isère flows east and west through the Tarentaise valley by Bourg St Maurice, Montiers, Albertville, and Montmélian, its principal tributary the Arve flows along the Maurienne valley used by the Mont Cenis Railway. The lake of Bourget discharges into the Rhone by the Savères canal. The climate of the department varies according to altitude and exposure. At Chambéry and Aix-les-Bains the average temperature is a little lower than that of Paris, but the rainfall is about 65 inches per annum, and this amount goes on increasing as the higher regions are reached.

With a total area of 1,423,254 acres, Savoy comprises 434,921 acres of uncultivated ground, 239,700 acres of arable, 205,105 in forests, 172,930 in meadows, 27,183 in pastures. More than half of the inhabitants, 194,344 out of 256,438, are engaged in agriculture. In 1881 there were in the department 97,487 cows, 19,328 oxen, 2570 horses, 8155 asses, 4207 mules, 98,826 sheep, (40 tons of wool), 19,428 pigs, 25,527 goats. About 1,870,000,000 gallons of milk are produced and 2463 tons of butter and 5911 tons of cheese are manufactured, of a total value of 4500,000. From the 19,800 beehives was obtained in 1881 87 tons of honey and 16 of wax. The grapes ripen to an altitude of 6025 feet, and is cultivated to an altitude of 8940. Several growths of Savoy are in great repute and the vineyards were (before the invasion of the phylloxera) one of the most important products of the department. Tobacco is also cultivated. In 1883 the crops comprised wheat, 40,665 bushels, meslin, 104,500, rye, 679,665, barley, 212,883, buckwheat, 20,641, maize, 245,245, oats, 722,007, potatoes, 1,244,003, pulse, 54,120, chestnuts, 72,720, beets, 13,440 tons, tobacco, 850 tons, hemp, 320 tons, colza seed, 284 tons, hemp seed, 195 tons, wine, 3,855,495 gallons (annual average 4,128,520 gallons), cider, 137,258 gallons (average 69,068 gallons). Notwithstanding deplorable clearances, Savoy still possesses considerable woods of pine, larch, beech, &c. The chestnut, of which the finest specimens are in the neighbourhood of Aix-les-Bains, groves, as do also the walnut and hazel, to a height of 3600 feet, the oak to 8900, the elm and the ash to 4250, the fir to 4000, and the pine to 7200. The department contains one of the richest deposits of sphalerite in Europe, and the Cusnet Company employs 700 hands in working it. Argentiferous lead and copper have also been occasionally worked. The Maurienne and the Tarentaise are rich in anthracite, and yielded in 1882 16,637 tons of fuel. Peat covers 1413 acres, with a thickness varying from 8 inches to 9 feet, and there are rich beds of different kinds of marble, fifty-two quarries of building stone, and quarries of limestone, plaster, cement, and slate, as well as deposits of black lead, jet, asbestos, talc, mica, ochre, sulphate of baryta, zinc, antimony, arsenic, manganese, titanium, sulphur. The department is particularly rich in mineral waters, and the most famous, those of Aix-les-Bains (not sulphurous) were frequented in the time of the Romans. The waters at Marlioz in the neighbourhood of the antiques or alkaline (iodine, bromine, and chlorine) of Challes near Chambéry rank among the most powerful of the natural sulphurous waters. The Salins-Moutiers waters in the Tarentaise are hot, saline, and rich in various minerals, and the hot springs of Brides-les-Bains in the same region are rich in the sulphates of soda and calcium. Silk is the leading object of industry in the department (31 tons of cocoons in 1883). The winding of the cocoons, the milking of the silk (3600 "tavalles" and spindles), and the weaving of the silk-fabrics (300 looms, 55 hand-loom) employ more than 1700 workmen, and the goods manufactured are valued at £380,000. Chambéry produces 71,000 yards of high-class gauze, 8000 yards of velvet, 13,000 yards of handkerchiefs, and some 800,000 yards of taffetas and various other silk stuffs. Linen manufactures employ 400 looms, woollen manufactures 1850 spindles. The peasants manufacture about 125,000 yards of coarse woollen stuffs from the home-grown wool. The blast furnaces and iron-works produced in 1881 175 tons of manufactured iron. Tanneries, paper-mills, paper-pulp factories, brick-works, saw-mills, flour-mills, &c., are all of some importance in the department, which counts altogether sixty-one establishments with steam-engines of (aggregate) 271 horse power. The number of inhabitants engaged in industrial pursuits

is 24,482, in commerce 14,016. Coal, skins, cotton, provisions are imported, cattle, cheese, butter, wool, stones, and various building materials, mineral waters, silk stuffs, tanned leather, and paper are exported. There are 204 miles of national roads, 2518 miles of other roads, and 150 miles of railroad. The population was 266,438 in 1881. The department forms the three dioceses of Chambéry (archbishopric), Moutiers, and St Jean-de-Maurienne, the court of appeal and university academy are at Chambéry, and the headquarters of the corps d'armée to which it belongs (the 14th) are at Grenoble. There are four arrondissements,—Chambéry (16,000 inhabitants in the town), Albertville (5000), Moutiers (2000), St Jean-de-Maurienne (3000),—29 cantons, and 408 communes. Aix-les-Bains (3741), owing to its hot springs, is the most important place in the department.

SAVOIE, HAUTE, a frontier department of France, formed in 1860 from the old provinces of Genevois, Chablais, and Faucigny, which constituted the northern half of the duchy of Savoy in the kingdom of Sardinia. Situated between 45° 40' and 46° 25' N lat and between 5° 50' and 7° 2' E long, it is bounded N by the Lake of Geneva, E by the Valais canton, S E by the duchy of Aosta (Italy), S and S W by the department of Savoie, W by the department of Ain, from which it is separated by the Rhone, and N W by the canton of Geneva. Almost everywhere except in the last direction the boundaries are natural. The greater portion of the department is occupied by mountains usually under 8000 feet in height, but it includes Mont Blanc (15,781 feet), while the confluence of the Fier with the Rhone is only 950 feet above the sea. The streams are torrential, and they all join the Rhone either directly or by the Lake of Geneva or the Isère. Most important is the Arve which crosses the department from south-east to north-west from Mont Blanc to Geneva by Chamonix, Salanches, and Bonneville, receiving from the right the Giffre and from the left the Borne. The Dranse falls into the Lake of Geneva between Evian and Thonon. Direct tributaries of the Rhone are the Usse and the Fier, the outflow of the Lake of Annecy. Passing Mègeve, to the south-west of Chamonix, the Arly goes to the Isère. A remarkable variety of climate is produced by the differences of altitude and exposure, it is mildest on the banks of the Lake of Geneva. Annecy has a moderate temperature, lower than that of Paris, but some parts of the shores of the lake, well sheltered and having a good exposure, form health resorts even in winter. The rainfall on the Lake of Geneva hardly exceeds 24 inches, it is three times as heavy in the mountains.

Of the total area of 1,066,229 acres 345,950 acres are arable, 214,990 woodland, 132,206 uncultivated, 95,880 pasture, 91,432 meadows, 21,252 vineyards. The live stock in 1880 comprised 9774 horses, 93,171 cows or heifers, 11,272 calves, 18,769 pigs, 25,381 goats, 33,000 sheep (wool-clip 41 tons), 21,626 birds (104 tons of honey, 83 of wax). Cheese is produced to the value of £220,000, and butter to £132,000. The harvest in 1883 amounted—wheat, 4,472,951 bushels, meslin, 196,570, rye, 190,503. For 1880 the returns were—barley, 138,043 bushels, buckwheat, 85,173, maize, 10,923, oats, 798,721, potatoes, 3,730,800; pulse, 42,507, chestnuts, 66,462, besides beetroot, hemp, flax, and colza. In 1883 the vintage was 3,321,834 gallons, the average for 1873–1882 being 3,199,570, and cider was produced to the amount of 757,922 gallons (average 743,808). Tobacco is successfully grown in a part of the department (Rumilly). The harvest in 1883 amounted to 1000 tons. Haute-Savoie still contains fine pine forests below 7200 feet of altitude, and fir, larch, and beech woods below 5000 feet, the limit of the elm and ash being 4250, and that of the oak 4000. Splendid walnuts and chestnuts are to be found as high up as 2950 feet and hazels as high as 3600. Argentiferous lead ores and copper, iron, and manganese ores exist, but are not much worked. About 1000 tons of anthracite and lignite were raised in 1882, and 12,405 tons of asphaltic limestone. Jurae and other beautiful marble, freestone largely used in the buildings of Lyons and Chambéry, limestone, and slates are all quarried. Mineral waters of various kinds abound (Amphion and Evian, chalybeate, St Gervais at the foot of Mont Blanc, hot, sulphurous, and chalybeate, Monthon, sulphurous, La Calotte, hot, sulphurous). Cotton manufacture is carried on at Annecy, where one establishment has 20,000 spindles, 600 power-looms, and 100 hand-looms, employing

500 workers. Some 500,000 or 600 000 yards of silk stuffs are woven throughout the department by some 550 workers, and wool-spinning and wool-manufactures are also carried on. In the iron industry 1921 tons of cast-iron and 1966 tons of malleable iron were manufactured in 1882. Clock-making, taught in two special schools, employs 3000 hands. Tanneries, paper-mills, tile-works, and flour-mills are numerous. About two-thirds of the cantons have the advantage of belonging to the neutral customs zone—that is, have the right of introducing foreign goods duty free, with the exception of powder and tobacco. Coal, cotton, metals, and provisions are imported, cheese, cattle, timber, leather, asphalt, building stone, and cacao are exported. The national roads make a total of 193 miles, other roads 3100 miles, and the railways—Annecy to Aix-les-Bains and to Annecy, on the line from Bellegarde to Evian—96 miles. With its 274,037 inhabitants (1881), who all speak French and are almost exclusively Roman Catholics, Haute-Savoie is only about one-tenth below the average density of France. It forms the diocese of Annecy, the court of appeal and the university academy are at Chambéry, and the department is included in the 14th corps d'armée district (Grenoble). There are 4 arrondissements—Annecy (population of town 11,000), Bonneville (2270), St Julien (1500), and Thonon (5440)—28 cantons, and 314 communes.

SAVONA, a city of Italy, in the province of Genoa, 25½ miles west of that town, and 91 miles south of Turin by rail, is after Genoa and Nice the most important of the cities of the Riviera. The greater part of the town is now modern, consisting of handsome gardens, boulevards, and well-paved broad streets lined with massive arcades and substantial houses, built in enormous square blocks from four to five stories high. It is surrounded with green-clad hills and luxuriant orange groves. On the Rock of St George stands the castle built by the Genoese in 1542, now used as a military prison. The cathedral (1589–1604) is a late Renaissance building with a dome of modern construction. In the Cappella Sistina stands the magnificent tomb erected by Sixtus IV to his parents. Facing the cathedral is the Della Rovere palace erected by Cardinal Giulio della Rovere (Julius II) as a kind of university, and now occupied by the prefecture, the post-office, and the courts. San Domenico (or Giovanni Battista) built by the Dominicans, occupies the site of the very ancient church of Sant' Antonio Abate. Several of the churches have paintings of some merit, and there is a municipal picture-gallery occupying part of the extensive buildings of the civil hospital of St Paul. The Teatro Chiabrera, erected in 1853 in honour of the lyric poet Chiabrera, who was born in Savona, and is buried there in the church of San Giacomo, has its façade adorned with statues of Alfieri, Goldoni, Metastasio, and Rossini. The town-house (with the public library founded by the bishop of Savona, Maria di Mari, in 1840), the episcopal palace, and the harbour tower surmounted by a colossal figure of the Virgin also deserve mention. As early as the 12th century, the Savonese built themselves a sufficient harbour, but in the 16th century their rivals the Genoese, fearing that Francis I of France intended to make it a great seat of Mediterranean trade, rendered it useless by sinking at its mouth vessels filled with large stones. The modern harbour, dating from 1815, has since 1880 been provided with a dock excavated in the rock, 986 feet long 460 wide and 23 feet deep; and other extensions are in progress. In 1884 1012 vessels (349,462 tons) entered and 988 (346,337 tons) cleared—the steamers being respectively 298 (273,237 tons) and 294 (270,953). The opening of the railway to Bra (1878) at once gave Savona an advantage over Genoa as a port for supplying Turin and Piedmont. A large import trade has since grown up, especially in coals (300,000 tons from Great Britain and France), which can be loaded directly from the ship into the trucks. The exports are confined to the products of the local industries, fruit, hoop-staves, &c. The potteries which have been long established at Savona export their earthenware to all parts of Italy; and there are glass-

works, soap-works, and one of the largest iron-foundries in North Italy. Shipbuilding is also carried on. The population of the commune, which includes the suburbs of Fornaci, Lavagnola, Legnoco and Zinola, and San Bernardo, was 19,611 in 1861 and 29,614 in 1881, that of the city at the latter date being 19,130.

Savona is the *Sesia* where, according to Livy, Mago stored his booty in the Second Punic War. In 1191 it bought up the territorial claims of the Marquises Del Carretto. Its whole history is that of a long struggle against the preponderance of Genoa. In 1746 it was captured by the king of Sardinia, but it was restored to Genoa by the treaty of Aix-la-Chapelle. Columbus, whose ancestors came from Savona, gave the name of the city to one of the first islands he discovered in the West Indies.

SAVONAROLA, GIROLAMO (1452–1498). The roll of Italian great men contains few grander names than that of Savonarola, and the career of this patriot-priest, reformer, and statesman is one of the strangest pages of Italy's history. Amid the splendid corruptions of the Italian Renaissance he was the representative of pure Christianity, the founder and ruler of an ideal Christian republic, and, when vanquished by the power of Rome, suffered martyrdom for the cause to which his life had been dedicated. His doctrines have been the theme of interminable controversies and contradictory judgments. He has been alternately declared a fanatic bent on the revival of mediæval barbarism and an enlightened precursor of the reformation, a true Catholic prophet and martyr and a shameless impostor and heretic. It is enough to say here that his best biographers and critics give satisfactory proofs that he was chiefly a reformer of morals, who, while boldly denouncing Papal corruptions, preserved an entire belief in all the dogmas of the Roman Catholic Church.

Girolamo Savonarola was born at Ferrara 21st September 1452, the third child of Michele Savonarola and his wife Elena Bonaccorsi of Mantua. His grandfather, Michele Savonarola, a Paduan physician of much repute and learning, had settled in Ferrara at the invitation of the reigning marquis, Nicholas III of Este, and gained a large fortune there. The younger Michele was a mere courtier and spendthrift, but Elena Savonarola seems to have been a woman of superior stamp. She was tenderly loved by her famous son, and his letters prove that she retained his fullest confidence through all the vicissitudes of his career.

Girolamo was a grave precocious child, with an early passion for learning. He was guided in his first studies by his wise old grandfather the physician, and, in the hope of restoring their fallen fortunes, his parents intended him for the same profession. Even as a boy he had intense pleasure in reading St Thomas Aquinas and the Arab commentators of Aristotle, was skilled in the subtleties of the schools, wrote verses, studied music and design, and, avoiding society, loved solitary rambles on the banks of the Po. Grass-grown Ferrara was then a gay and bustling town of 100,000 inhabitants, its prince Borso d'Este a most magnificent potentate. To the mystic young student all festivities were repulsive, and although reared in a courtier-household he early asserted his individuality by his contempt for the pomp and glitter of court life. At the age of nineteen, however, he had as yet no thought of renouncing the world, for he was then passionately in love with the child of a friendly neighbour, a Strozzi, exiled from Florence. His suit was repulsed with disdain, no Strozzi, he was told, might stoop to wed a Savonarola. This blow probably decided his career, but he endured two years of misery and mental conflict before resolving to abandon his medical studies and devote himself to God's service. He was full of doubt and self-distrust, disgust for the world did not seem to him a sufficient

qualification for the religious life, and his daily prayer was, "Lord! teach me the way my soul should walk." But in 1474 his doubts were dispelled by a sermon heard at Faenza, and his way was clear. Dreading the pain of bidding farewell to his dear ones, he secretly stole away to Bologna, entered the monastery of St Domenico and then acquainted his father with his reasons for the step. The world's wickedness was intolerable, he wrote, throughout Italy he beheld vice triumphant, virtue despised. Among the papers he had left behind at Ferrara was a treatise on "Contempt of the World," inveighing against the prevalent corruption and predicting the speedy vengeance of Heaven. His novitiate was marked by a fervour of humility. He sought the most menial offices, and did penance for his sins by the severest austerities. According to contemporary writers he was worn to a shadow.

All portraits of this extraordinary man are at first sight almost repulsively ugly, but written descriptions tell us that his gaunt features were beautified by an expression of singular force and benevolence. Luminous dark eyes sparkled and flamed beneath his thick, black brows, and his large mouth and prominent nether lip were as capable of gentle sweetness as of power and set resolve. He was of middling stature, dark complexion, had a nervous system of exceeding delicacy and the sanguineo-bilious temperament so often associated with genius. His manners were simple, his speech unadorned and almost homely. His splendid oratorical power was as yet unrevealed, but his intellectual gifts being at once recognized his superiors charged him with the instruction of the novices, instead of the humbler tasks he had wished to fulfil. He passed six quiet years in the convent, but his poems written during that period are expressive of burning indignation against the increasing corruptions of the church and profoundest sorrow for the calamities of his country.

In 1482 he reluctantly accepted a mission to Ferrara, and, regarding earthly affections as snares of the evil one, tried to keep aloof from his family. His preachings attracted slight attention there, no one—as he later remarked—being a prophet in his own land. An outbreak of hostilities between Ferrara and Venice, fomented by Pope Sixtus IV., soon caused his recall to Bologna. Thence he was despatched to St Mark's in Florence, the scene of his future triumph and downfall.

Lorenzo the Magnificent was then (1482) at the height of his power and popularity, and the Florentines, dazzled by his splendour and devoted to pleasure and luxury, were docile subjects to his rule. At first Savonarola was enchanted with Florence. Fresh from the gloom of Bologna, sickened by the evils wrought on Italy by the scandalous nepotism of the pope, and oppressed by some natural human anxiety as to his reception in a strange city, the gaiety and charm of his novel surroundings lifted a weight from his soul. His cloister, sanctified by memories of St Antonine and adorned with the inspired paintings of Frà Angelico, seemed to him a fore-court of heaven. But his content speedily changed to horror. The Florence streets rang with Lorenzo's ribald songs (the "canti carnascaleschi"), the smooth, cultured citizens were dead to all sense of religion or morality; and the spirit of the fashionable heathen philosophy had even infected the brotherhood of St Mark. In 1483 Savonarola was Lenten preacher in the church of St Lorenzo, but his plain, earnest exhortations attracted few hearers, while all the world thronged to Santo Spirito to enjoy the elegant rhetoric of Frà Mariano da Genazzano. Discouraged by this failure in the pulpit, Savonarola now devoted himself to teaching in the convent, but his zeal for the salvation

of the apathetic townsfolk was soon to stir him to flesh efforts. Convinced of being divinely inspired, he had begun to see visions, and discovered in the Apocalypse symbols of the heavenly vengeance about to overtake this sin-laden people. In a hymn to the Saviour composed at this time he gave vent to his prophetic dismay. The papal chair was now filled by Innocent VIII., whose rule was even more infamous than that of his predecessor Sixtus IV.

Savonarola's first success as a preacher was gained at St Geminiano (1484-85), but it was only at Brescia in the following year that his power as an orator was fully revealed. In a sermon on the Apocalypse he shook men's souls by his terrible threats of the wrath to come, and drew tears from their eyes by the tender pathos of his assurances of divine mercy. A Brescian friar relates that a halo of light was seen to flash round his head, and the citizens remembered his awful prophecies when in 1512 their town was put to the sack by Gaston de Foix.

Soon, at a Dominican council at Reggio, Savonarola had occasion to display his theological learning and subtlety. The famous Pico della Mirandola was particularly impressed by the friar's attainments, and is said to have urged Lorenzo de' Medici to recall him from Lombardy. When Savonarola returned to Florence in 1490, his fame as an orator had gone there before him. The cloister garden was too small for the crowds attending his lectures, and on the 1st August 1490 he gave his first sermon in the church of St Mark. To quote his own words, it was "a terrible sermon," and legend adds that he foretold he should preach for eight years.

And now, for the better setting forth of his doctrines, to silence pedants, and confute malignant misinterpretation, he published a collection of his writings. These proved his knowledge of the ancient philosophy he so fiercely condemned, and showed that no ignorance of the fathers caused him to seek inspiration from the Bible alone. *The Triumph of the Cross* is his principal work, but everything he wrote was animated by the ardent spirit of piety evidenced in his life. Savonarola's sole aim was to bring mankind nearer to God.

In 1491 he was invited to preach in the cathedral, Sta Maria del Fiore, and his rule over Florence may be said to begin from that date. The anger and uneasiness of Lorenzo de' Medici gave testimony to his power. Five of the leading men of Florence were sent to urge him to moderate his tone, and in his own interest and that of his convent to show more respect to the head of the state. But Savonarola rejected their advice. "Tell your master," he said in conclusion, "that, albeit I am a humble stranger, he the lord of Florence, yet I shall remain and he depart." Afterwards, in the presence of many witnesses, he foretold that stupendous changes impended over Italy,—that Lorenzo, the pope, and the king of Naples were all near unto death.

In the July of the same year he was elected prior of St Mark's. As the convent had been rebuilt by Cosimo, and enriched by the bounty of the Medici, it was considered the duty of the new superior to present his homage to Lorenzo. Savonarola, however, refused to conform to the usage. His election was due to God, not Lorenzo; to God alone would he promise submission. Upon this the sovereign angrily exclaimed: "This stranger comes to dwell in my house, yet will not stoop to pay me a visit." Nevertheless, disdaining to recognize the enmity of a mere monk, he tried various conciliatory measures. All were rejected by the unbending prior, who even refused to let his convent profit by Lorenzo's donations. The Magnifico then sought to undermine his popularity, and Frà Mariano was employed to attack him from the pulpit. But the

preacher's scandalous accusations missed their mark, and disgusted his hearers without hurting his rival Savonarola took up the challenge, his eloquence prevailed, and Frà Mariano was silenced. But the latter, while feigning indifference, was thenceforth his rancorous and determined foe.

In April 1492 Lorenzo de' Medici was on his death-bed at Careggi. Oppressed by the weight of his crimes, he needed some assurance of divine forgiveness from truster lips than those of obsequious courtiers, and summoned the unyielding prior to shrive his soul. Savonarola reluctantly came, and, after hearing the agitated confession of the dying prince, offered absolution upon three conditions. Lorenzo asked in what they consisted. First, "You must repent and feel true faith in God's mercy." Lorenzo assented. Secondly, "You must give up your ill-gotten wealth." This too Lorenzo promised, after some hesitation, but upon hearing the third clause, "You must restore the liberties of Florence," Lorenzo turned his face to the wall and made no reply. Savonarola waited a few moments and then went away. And shortly after his penitent died unabsolved.

Savonarola's influence now rapidly increased. Many adherents of the late prince came over to his side, disgusted by the violence and incompetency of Piero de' Medici's rule. All state affairs were mismanaged, and Florence was fast losing the power and prestige acquired under Lorenzo. The same year witnessed the fulfilment of Savonarola's second prediction in the death of Innocent VIII (July 1492), men's minds were full of anxiety, and the scandalous election of Cardinal Borgia to the papal chair heralded the climax of Italy's woes. The friar's utterances became more and more fervent and impassioned. Patriotic solatude combined with close study of Biblical prophecies had stirred him to a pious frenzy, in which he saw visions and believed himself the recipient of divine revelations. It was during the delivery of one of his forcible Advent sermons that he beheld the celebrated vision, recorded in contemporary medals and engravings, that is almost a symbol of his doctrines. A hand appeared to him bearing a flaming sword inscribed with the words, "Gladus Domini supra terram cito et velociter." He heard supernatural voices proclaiming mercy to the faithful, vengeance on the guilty, and mighty cries that the wrath of God was at hand. Then the sword bent towards the earth, the sky darkened, thunder pealed, lightning flashed, and the whole world was wasted by famine, bloodshed, and pestilence. It was probably the noise of these sermons that caused the friar's temporary removal from Florence at the instance of Piero de' Medici. He was presently addressing enthusiastic congregations at Prato and Bologna. In the latter city his courage in rebuking the wife of Bentivoglio, the reigning lord, for interrupting divine service by her noisy entrance nearly cost him his life. Assassins were sent to kill him in his cell, but, awed, it is said, by Savonarola's words and demeanour they fled dismayed from his presence. At the close of his last sermon the undaunted friar publicly announced the day and hour of his departure from Bologna, and his lonely journey on foot over the Apennines was safely accomplished. He was rapturously welcomed by the community of St Mark's, and at once proceeded to re-establish the discipline of the order and to sweep away all abuses. For this purpose he obtained, after much difficulty, a papal brief emancipating the Dominicans of St Mark from the rule of the Lombard vicars of that order. He thus became an independent authority, no longer at the command of distant superiors. Thoroughly reorganizing the convent, he relegated many of the brethren to a quieter retreat outside the city, only

retaining in Florence those best fitted to aid in intellectual labour. To render the convent self-supporting, he opened schools for various branches of art, and promoted the study of Oriental languages. His efforts were completely successful, the brethren's enthusiasm was fired by their superior's example, religion and learning made equal progress, St Mark's became the most popular monastery in Florence, and many citizens of noble birth flocked thither to take the vows.

Meanwhile Savonarola continued to denounce the abuses of the church and the guilt and corruption of mankind, and thundered forth predictions of heavenly wrath. The scourge of war was already at hand, for in 1494 the duke of Milan demanded the aid of France, and King Charles VIII brought an army across the Alps. Piero de' Medici, maddened with fear, and forgetting that hitherto Florence had been the firm friend of France, made alliance with the Neapolitan sovereign whose kingdom was claimed by Charles. Then, repenting this ill-judged step, he hurried in person to the French camp at Pietra Santa, and humbled himself before the king. And, not content with agreeing to all the latter's demands, he further promised large sums of money and the surrender of the strongholds of Pisa and Leghorn.

This news drove Florence to revolt, and the worst excesses were feared from the popular fury. But even at this crisis Savonarola's influence was all-powerful, and a bloodless revolution was effected. Piero Capponi's declaration that "it was time to put an end to this baby government" was the sole weapon needed to depose Piero de' Medici. The resuscitated republic instantly sent a fresh embassy to the French king, to arrange the terms of his reception in Florence. Savonarola was one of the envoys, Charles being known to entertain the greatest veneration for the friar who had so long predicted his coming and declared it to be divinely ordained. He was most respectfully received at the camp, but could obtain no definite pledges from the king, who was bent on first coming to Florence. During Savonarola's absence Piero de' Medici had re-entered the city, found his power irretrievably lost, and been contemptuously but peaceably expelled. It is a proof of the high esteem in which Savonarola's convent was held that, although the headquarters of the victorious popular party, Piero's brother, Cardinal Medici, entrusted to its care a large share of the family treasures.

Returning full of hope from Pietra Santa, Savonarola might well have been dismayed by the distracted state of public affairs. There was no Government, and revolted Pisa was secretly favoured by the monarch who was knocking at the gates of Florence. Nevertheless, with the aid of Capponi, he guided the bewildered city safely through these critical days. Charles entered Florence on the 17th November 1494, and the citizens' fears evaporated in jests on the puny exterior of the "threatened scourge." But the exorbitance of his demands soon showed that he came as a foe. All was agitation, disturbances arose, and serious collision with the French troops seemed inevitable. The signory resolved to be rid of their dangerous guests; and, when Charles threatened to sound his trumpets unless the sums exacted were paid, Capponi tore up the treaty in his face and made the memorable reply: "Then we will ring our bells." The monarch was cowed, accepted moderate terms, and, yielding to Savonarola's remonstrances, left Florence on the 24th November.

The city was now free but in the utmost disorder, its commerce ruined, its treasury drained. After seventy years' subjection to the Medici it had forgotten the art of self-government, and felt the need of a strong guiding hand. So the citizens turned to the patriot monk whose

words had freed them of King Charles, and Savonarola became the lawgiver of Florence. The first thing done at his instance was to relieve the starving populace within and without the walls, shops were opened to give work to the unemployed, all taxes, especially those weighing on the lower classes, were reduced, the strictest administration of justice was enforced, and all men were exhorted to place their trust in the Lord. And, after much debate as to the constitution of the new republic, Savonarola's influence carried the day in favour of Soderini's proposal of a universal or general government, with a great council on the Venetian plan, but modified to suit the needs of the city. The Florentines' love for their great preacher was enhanced by gratitude on this triumphant defence of their rights. The great council consisted of 3200 citizens of blameless reputation and over twenty-five years of age, a third of the number sitting for six months in turn in the hall of the Cinquecento expressly built for the purpose. There was also an upper council of eighty, which in conjunction with the signory decided all questions of too important and delicate a nature for discussion in the larger assembly. These institutions were approved by the people, and gave a fair promise of justice. Savonarola's programme of the new government was comprised in the following formula—(1) fear of God and purification of manners, (2) promotion of the public welfare in preference to private interests, (3) a general amnesty to political offenders, (4) a council on the Venetian model but with no doge. At first the new machinery acted well, the public mind was tranquil, and the war with Pisa—not as yet of threatening proportions—was enough to occupy the Florentines and prevent intestine feuds.

Without holding any official post in the commonwealth he had created the prior of St Mark's was the real head of the state, the dictator of Florence, and guarded the public weal with extraordinary political wisdom. At his instance the tyrannical system of arbitrary imposts and so-called voluntary loans was abolished, and replaced by a tax of ten per cent (*la decima*) on all real property. The laws and edicts of this period read like paraphrases of Savonarola's sermons, and indeed his counsels were always given as *addenda* to the religious exhortations in which he denounced the sins of his country and the pollution of the church, and urged Florence to cast off iniquity and become a truly Christian city, a pattern not only to Rome but to the world at large. His eloquence was now at the flood. Day by day his impassioned words, filled with the spirit of the Old Testament, wrought upon the minds of the Florentines and stung them to a pitch of pious emotion never before—and never since—attained by them. Then fervour was too hot to be lasting, and Savonarola's uncompromising spirit roused the hatred of political adversaries as well as of the degraded court of Rome. Even now, when his authority was at its highest, when his fame filled the land, and the vast cathedral and its precincts lacked space for the crowds flocking to hear him, his enemies were secretly preparing his downfall.

Pleasure-loving Florence was completely changed. Abjuring pomps and vanities, its citizens observed the ascetic regime of the cloister, half the year was devoted to abstinence and few dared to eat meat on the fasts ordained by Savonarola. Hymns and lauds rang in the streets that had so recently echoed with Lorenzo's dissolute songs. Both sexes dressed with Puritan plainness, husbands and wives quitted their homes for convents, marriage became an awful and scarcely permitted rite, mothers suckled their own babes, and persons of all ranks—nobles, scholars, and artists—renounced the world to assume the Dominican robe. Still more wonderful was Savonarola's influence over children, and their response to his appeals is a proof

of the magnetic power of his goodness and purity. He organized the boys of Florence in a species of sacred militia, an inner republic, with its own magistrates and officials charged with the enforcement of his rules for the holy life. It was with the aid of these youthful enthusiasts that Savonarola arranged the religious carnival of 1496, when the citizens gave their costliest possessions in alms to the poor, and tonsured monks, crowned with flowers, sang lauds and performed wild dances for the glory of God. In the same spirit, and to point the doctrine of renunciation of carnal goods, he celebrated the carnival of 1497 by the famous "burning of the vanities" in the Piazza della Signoria. A Venetian merchant is known to have bid 22,000 gold florins for the doomed vanities, but the scandalized authorities not only rejected his offer but added his portrait to the pile. Nevertheless the æsthetic value of the objects consumed has been greatly exaggerated by some writers. There is no proof that any book or painting of real merit was sacrificed, and Savonarola was neither a foe to art nor to learning. On the contrary, so great was his respect for both that, when there was a question of selling the Medici library to pay that family's debts, he saved the collection at the expense of the convent purse.

Meanwhile events were taking a turn hostile to the prior. Alexander VI had long regretted the enfranchisement of St Mark's from the rule of the Lombard Dominicans, and now, having seen a transcript of one of Savonarola's denunciations of his crimes, resolved to silence this daring preacher at any cost. Bribery was the first weapon employed, and a cardinal's hat was held out as a bait. But Savonarola indignantly spurned the offer, replying to it from the pulpit with the prophetic words: "No hat will I have but that of a martyr, reddened with my own blood."

So long as King Charles remained in Italy Alexander's concern for his own safety prevented all vigorous measures against the friar. But no Borgia ever forgot an enemy. He bided his time, and the transformation of sceptical Florence into an austere Christian republic claiming the Saviour as its head only increased his resolve to crush the man who had wrought this marvel. The potent duke of Milan, Ludovico Sforza, and other foes were labouring for the same end, and already in July 1495 a papal brief had courteously summoned Savonarola to Rome. In terms of equal courtesy the prior declined the invitation, nor did he obey a second, less softly worded, in September. Then came a third, threatening Florence with an interdict in case of renewed refusal. Savonarola disregarded the command, but suspending his sermons went to preach for a while in other Tuscan cities. But in Lent his celebrated sermons upon Amos were delivered in the duomo, and again he urged the necessity of reforming the church, striving by ingenious arguments to reconcile rebellion against Alexander with unalterable fidelity to the Holy See. All Italy recognized that a mortal combat was going on between a humble friar and the head of the church. What would be the result? Savonarola's voice was arousing a storm that might shake even the power of Rome! Alive to the danger, the pope knew that his foe must be crushed, and the religious carnival of 1496 afforded a good pretext for stronger proceedings against him. The threatened anathema was, for some reason, deferred, but a brief untitling St Mark's to a new Tuscan branch of the Dominicans now deprived Savonarola of his independent power. However, in the beginning of 1497 the Fragnoni were again in office, with the prior's staunch friend, Francesco Valori, at their head. In March the aspect of affairs changed. The Arrabbiati and the Medicæan faction merged political differences in their

common hatred to Savonarola. Piero de' Medici's fresh attempt to re-enter Florence failed; nevertheless his followers continued their intrigues, and party spirit increased in virulence. The citizens were growing weary of the monastic austerities imposed on them, and Alexander foresaw that his revenge was at hand.

A signory openly hostile to Savonarola took office in May, and on Ascension Day his enemies ventured on active insult. His pulpit in the duomo was defiled, an ass's skin spread over the cushion, and sharp nails fixed in the board on which he would strike his hand. The outrage was discovered and remedied before the service began, and, although the Arrabbiati half filled the church and even sought to attempt his life, Savonarola kept his composure and delivered a most impressive sermon. But the incident proved the bitterness and energy of his foes, and the signory, in feigned anxiety for the public peace, besought him to suspend his discourses. Shortly afterwards the threatened bull of excommunication was launched against him, and Frà Mariano was in Rome stimulating the pope's wrath. Savonarola remained undaunted. The sentence was null and void, he said. His mission was divinely inspired, and Alexander, elected simoniacally and laden with crimes, was no true pope. Nevertheless the reading of the bull in the duomo with the appropriate, terrifying ceremonial made a deep impression on the Florentines. And now, the Arrabbiati signory putting no check on the Compagnacci, the city returned to the wanton licence of Lorenzo's reign. But in July Savonarola's friends were again in power and did their best to have his excommunication removed. Meanwhile party strife was stilled by an outbreak of the plague. The prior of St Mark's used the wisest precautions for the safety of his two hundred and fifty monks, sustained their courage by his own, and sent the younger men to a country retreat out of reach of contagion. During this time Rome was horror-struck by the mysterious murder of the young duke of Gandia, and the bereaved pope mourned his son with the wildest grief. Savonarola addressed to the pontiff a letter of condolence, boldly urging him to bow to the will of Heaven and repent while there was yet time.

The plague ended, Florence was plunged in fresh troubles from Medicean intrigues, and a conspiracy for the restoration of Piero was discovered. Among the five leading citizens concerned in the plot was Bernardo del Nero, a very aged man of lofty talents and position. The gonfaloniere, Francesco Valori, used his strongest influence to obtain their condemnation, and all five were put to death. It is said that at least Bernardo del Nero would have been spared had Savonarola raised his voice, but, although refraining from any active part against the prisoners, the prior would not ask mercy for them. This silence proved fatal to his popularity with moderate men, gave new adherents to the Arrabbiati, and whetted the fury of the pope, Sforza, and all potentates well disposed to the Medici faction. He was now interdicted from preaching even in his own convent and again summoned to Rome. As before, the mandate was disobeyed. He refrained from public preaching, but held conferences in St Mark's with large gatherings of his disciples, and defied the interdict on Christmas Day by publicly celebrating mass and heading a procession through the cloisters.

The year 1498, in which Savonarola was to die a martyr's death, opened amid seemingly favourable auspices. The Pagnoni were again at the head of the state, and by their request the prior resumed his sermons in the duomo, while his dearest disciple, Frà Domenico Buonvicini, filled the pulpit of St Lorenzo. Scaffoldings had to be erected to accommodate Savonarola's congregation, and the Arrabbiati could only vent their spite by noisy riots on the

piazza outside the cathedral. For the last time the carnival was again kept with strange religious festivities, and many valuable books and works of art were sacrificed in a second bonfire of "vanities." But menacing briefs poured in from Rome, the pope had read one of Savonarola's recent sermons on Exodus, the city itself was threatened with interdict, and the Florentine ambassador could barely obtain a short delay. Now too the Pagnoni quitted office, the new signory was less friendly, and the prior was persuaded by his adherents to retire to St Mark's. There he continued to preach with unabated zeal, and, since the women of Florence deplored the loss of his teachings, one day in the week was set apart for them. The signory tried to conciliate the pope by relating the wonderful spiritual effects of their preacher's words, but Alexander was obdurate. The Florentines must either silence the man themselves, or send him to be judged by a Roman tribunal.

Undismayed by personal danger, Savonarola resolved to appeal to all Christendom against the unrighteous pontiff, and despatched letters to the rulers of Europe adjuring them to assemble a council to condemn this antipope. The council of Constance, and the deposition of John XXIII, were satisfactory precedents still remembered by the world. One of these letters being intercepted and sent to Rome by the duke of Milan (it is said) proved fatal to the friar. The papal threats were now too urgent to be disregarded, and the cowed signory entreated Savonarola to put an end to his sermons. He reluctantly obeyed, and concluded his last discourse with the tenderest and most touching farewell. Perhaps he foresaw that he should never again address his flock from the pulpit.

The Government now hoped that Alexander would be appeased and Florence allowed to breathe freely. But although silenced the prophet was doomed, and the folly of his disciples precipitated his fate. A creature of the Arrabbiati, a Franciscan friar named Francesco di Puglia, challenged Savonarola to prove the truth of his doctrines by the ordeal of fire. At first the prior treated the provocation with merited contempt, but unfortunately his too zealous disciple Frà Domenico accepted the challenge. And, when the Franciscan declared that he would enter the fire with Savonarola alone, Frà Domenico protested his willingness to enter it with any one in defence of his master's cause. So, as Savonarola resolutely declined the trial, the Franciscan deputed a convert, one Giuliano dei Rondinelli, to go through the ordeal with Frà Domenico. There were long preliminary disputes. Savonarola, perceiving that a trap was being laid for him, discontenanced the "exponent" until over-persuaded by his disciple's prayers. Perhaps because it was a mere *reductio ad absurdum* of his dearest beliefs, he was strangely perplexed and vacillating with regard to it. With his firm conviction of the divinity of his mission he sometimes felt assured of the triumphant issue of the terrible ordeal. Alternately swayed by impassioned zeal and the promptings of reason, his calmer judgment was at last overborne by the fanaticism of his followers. Aided by the signory, which was playing into the hands of Rome, the Arrabbiati and Compagnacci pressed the matter on, and the way was now clear for Savonarola's destruction.

On the 7th April 1498 an immense throng gathered in the Piazza della Signoria to enjoy the barbarous sight. Two thick banks of combustibles forty yards long, with a narrow space between, had been erected in front of the palace, and five hundred soldiers kept a wide circle clear of the crowd. Some writers aver that the piles were charged with gunpowder. Not only the square but every window, balcony, or housetop commanding a glimpse of it was filled with eager spectators. The Dominicans

from one side, the Franciscans from the other, marched in solemn procession to the Loggia dei Lanzi, which had been divided by a hoarding into two separate compartments. The Dominicans were led by Savonarola carrying the host, which he reverently deposited on an altar prepared in his portion of the loggia, and when Frà Domenico was seen to kneel before it the Pagnoni burst into a song of praise. The magistrates signalled to the two champions to advance. Frà Domenico stepped forward, but neither Rondinelli nor Frà Francesco appeared. The Franciscans began to urge fantastic objections. The Dominican's vestments might be bewitched, they said. Then, when he promptly changed them for a friar's robe, they pretended that his proximity to Savonarola had probably renewed the charm. He must remove the cross that he wore. He again complied,—was ready to fulfil every condition in order to enter the fire. But fresh obstacles were suggested by the Franciscans, and, when Savonarola insisted that his champion should bear the host, they cried out against the sacrilege of exposing the Redeemer's body to the flames. All was turmoil and confusion, the crowd frantic. And, although Rondinelli had not come, the signory sent angry messengers to ask why the Dominicans delayed the trial. Meanwhile the Ariabhatti stirred the public discontent and threw all the blame on Savonarola. Some Compagnacci assaulted the loggia in order to kill him, but were driven back by Salvati's band. The foreign soldiery, fearing an attack on the palace, charged the excited mob, and the tumult was temporarily checked. It was now late in the day, and a storm shower gave the authorities a pretext for declaring that heaven was against the ordeal. The crafty Franciscans slipped away unobserved, but Savonarola raising the host attempted to lead his monks across the piazza in the same solemn order as before. On this the popular fury burst forth. De-frauded of their bloody diversion, the people were wild with rage. Frà Girolamo's power was suddenly at an end. These Florentines who had worshipped him as a saint turned on him with rabid hate. Neither he nor his brethren would have lived to reach St Mark's but for the devoted help of Salvati and his men. They were pelted, stoned, and followed with the vilest execrations. Against the real culprits, the dastardly Franciscans, no anger was felt, the zealous prior, the prophet and lawgiver of Florence, was made the popular scapegoat. Notwithstanding the anguish that must have filled his heart, the fallen man preserved his dignity and calm. Mounting his own pulpit in St Mark's he quietly related the events of the day to the faithful assembled in the church, and then withdrew to his cell, while the mob on the square outside was clamouring for his blood.

The next morning, the signory having decreed the prior's banishment, Francesco Valori and other leading Pagnoni hurried to him to concert measures for his safety. Meanwhile the Government decided on his arrest, and no sooner was this made public than the populace rushed to the attack of the convent. The doors of St Mark's were hastily secured, and Savonarola discovered that his adherents had secretly prepared arms and munitions and were ready to stand a siege. The signory sent to order all laymen to quit the cloister, and a special summons to Valori. After some hesitation the latter obeyed, hoping by his influence to rally all the Pagnoni to the rescue. But he was murdered in the street, and his palace sacked by the mob. The monks and their few remaining friends made a most desperate defence. In vain Savonarola besought them to lay down their arms. Frà Benedetto the painter and others fought like lions, while some hurled tiles on the assailants below. When the church was finally stormed Savonarola was seen praying at the altar, and Frà

Domenico, armed with an enormous candlestick, guarding him from the blows of the mob. Profiting by the smoke and confusion a few disciples dragged their beloved master to the inner library and urged him to escape by the window. He hesitated, seemed about to consent, when a cowardly monk, one Malatesta Sacramoro, cried out that the shepherd should lay down his life for his flock. Thereupon Savonarola turned, bade farewell to the brethren, and, accompanied by the faithful Domenico, quietly surrendered to his enemies. Later, betrayed by the same Malatesta, Frà Silvestro was also seized. Humbled, insulted, and injured by the ferocious crowd, the prisoners were conveyed to the Palazzo Vecchio, and Savonarola was lodged in the tower cell which had once harboured Cosimo de' Medici.

Now came an exultant brief from the pope. His well-beloved Florentines were true sons of the church, but must crown their good deeds by despatching the criminals to Rome. Sforza was equally rejoiced by the news, and the only potentate who could have perhaps saved Savonarola's life, Charles of France, had died on the day of the ordeal by fire. Thus another of the friar's prophecies was verified, and its fulfilment cost him his sole protector.

The result of the trial was a foregone conclusion. The signory refused to send their prisoners to Rome, but they did Rome's behests. Savonarola's judges were chosen from his bitterest foes. Day after day he was cruelly tortured, and in his agony, with a frame weakened by constant austerity and the mental strain of the past months, he made every admission demanded by his tormentors. But directly he was released from the rack he always withdrew the confessions uttered in the delirium of pain. And, these being too incoherent to serve for a legal report, a false account of the friar's avowals was drawn up and published instead of his real words.

Though physically unable to resist torture, Savonarola's clearness of mind returned whenever he was at peace in his cell. So long as writing materials were allowed him he employed himself in making a commentary on the Psalms, in which he restated all his doctrines. His doom was fixed, but some delay was caused by the pope's unwillingness to permit the execution in Florence. Alexander was frantically eager to see his enemy die in Rome. But the signory remained firm, insisting that the false prophet should suffer death before the Florentines whom he had so long led astray. The matter was finally compromised. A second mock trial was held by two apostolic commissioners specially appointed by the pope. One of the new judges was a Venetian general of the Dominicans, the other a Spaniard. Meanwhile the trial of Brothers Domenico and Silvestro was still in progress. The former remained nobly faithful to his master and himself. No extremity of torture could make him recant or extract a syllable to Savonarola's hurt; he steadfastly repeated his belief in the divinity of the prior's mission. Frà Silvestro on the contrary gave way at mere sight of the rack, and thus seer of heavenly visions owned himself and master guilty of every crime laid to their charge.

The two commissioners soon ended their task. They had the pope's orders that Savonarola was to die "even were he a second John the Baptist." On three successive days they "examined" the prior with worse tortures than before. But he now resisted pain better, and, although more than once a promise to recant was extorted from him, he reasserted his innocence when unbound, crying out, "My God, I denied Thee for fear of pain." On the evening of May 22 sentence of death was pronounced on him and his two disciples. Savonarola listened unmoved to the awful words, and then quietly resumed his interrupted devotions. Frà Domenico exulted in the thought of dying

by his master's side, Frà Silvestro, on the contrary, raved with despair.

The only favour Savonarola craved before death was a short interview with his fellow victims. Thus, after long debate, the signory unwillingly granted, and meanwhile a monk was sent to shrieve all the three. The memorable meeting took place in the hall of the Cinquecento. During their forty days of confinement and torture each one had been told that the others had recanted, and the false report of Savonarola's confession had been shown to the two monks. The three were now face to face for the first time. Frà Domenico's loyalty had never wavered, and the weak Silvestro's enthusiasm rekindled at sight of his chief. Savonarola prayed with the two men, gave them his blessing, and exhorted them by the memory of their Saviour's crucifixion to submit meekly to their fate. Midnight was long past when Savonarola was led back to his cell. Jacopo Niccolini, one of a religious fraternity dedicated to consoling the last hours of condemned men, remained with him. Spent with weakness and fatigue he asked leave to rest his head on his companion's lap, and quickly fell into a quiet sleep. As Niccolini tells us, the martyr's face became serene and smiling as a child's. On awaking he addressed kind words to the compassionate brother, and then prophesied that due calamities would befall Florence during the reign of a pope named Clement. The carefully recorded prediction was verified by the seige of 1529.

The execution took place the next morning. A scaffold, connected by a wooden bridge with the magistrates' rostrum, had been erected on the spot where the piles of the ordeal had stood. At one end of the platform was a huge cross with faggots heaped at its base. As the prisoners, clad in penitential haircloth, were led across the bridge, wanton boys thrust sharp sticks between the planks to wound their feet. First came the ceremonial of degradation. Sacerdotal robes were thrown over the victims, and then roughly stripped off by two Dominicans, the bishop of Vasona and the prior of Sta Maria Novella. To the bishop's formula, "I separate thee from the church militant and the church triumphant," Savonarola replied in firm tones, "Not from the church triumphant, that is beyond thy power." By a refinement of cruelty Savonarola was the last to suffer. His disciples' bodies already dangled from the arms of the cross before he was hung on the centre beam. Then the pile was fired. For a moment the wind blew the flames aside, leaving the corpses untouched. "A miracle," cried the weeping Piagnoni, but then the fire leapt up and ferocious yells of triumph rang from the mob. At dusk the martyrs' remains were collected in a cart and thrown into the Arno.

Savonarola's party was apparently annihilated by his death, but, when in 1529-30 Florence was exposed to the horrors predicted by him, the most heroic defenders of his beloved if ungrateful city were Piagnoni who ruled their lives by his precepts and revered his memory as that of a saint.

Savonarola's writings may be classed in three categories—(1) numerous sermons, collected mainly by Lorenzo Viohi, one of his most enthusiastic hearers; (2) an immense number of devotional and moral essays and some theological works, of which *Il Trionfo della Croce* is the chief; (3) a few short poems and a political treatise on the government of Florence. Although his faith in the dogmas of the Roman Catholic Church never swerved, his strenuous protests against papal corruptions, his reliance on the Bible as his surest guide, and his intense moral earnestness undoubtedly connect Savonarola with the movement that heralded the Reformation.

(L V)

SAVOY The history of the house of Savoy shows in a striking manner how the destinies of a nation may depend on the fortunes of a princely family. During eight centuries, and through all changes of fortune, the princes of Savoy have kept one end steadily in view, and, in the words of Charles Emmanuel III, have "treated Italy as an artichoke to be eaten leaf by leaf." The ambitions of princes and the interests of the people have fortunately tended in the same direction, and their work is now perfected in the glory of their house and the freedom of the state.

The descent of HUMBERT the Whitehanded, the founder of the family, is uncertain, but he was most probably a son of Amadeus, the great-grandson of that Boso of Provence (879) who was father of the emperor Louis the Blind. In reward for services rendered to Rudolph III of Ailes, Humbert obtained from him in 1027 the counties of Savoy and Maurienne, and from the emperor Conrad the Salic Chablais and the Lower Valais. His territories, therefore, all lay on the north-western slopes of the Alps. On his death in 1048 he was succeeded perhaps by his eldest son AMADEUS I, but eventually by his fourth son OTTO, who, by his marriage with Adelaide, sole heiress of the marquis of Susa, obtained the counties of Turin and the Val d'Aosta, and so acquired a footing in the valley of the Po. His wife's rank, too, as marchioness made the family guardians of the frontier by authority of the king of Italy, as they had been before by possession of territory, and was the foundation of their subsequent power as "wardens" of the Alps. Otto was succeeded in 1060 by his son AMADEUS II, who maintained a judicious neutrality between his brother-in-law the emperor Henry IV and the pope. In reward for his mediation between them he obtained from the former after Canossa the province of Bugey. The accession of his son HUMBERT II in 1080 brought fresh increase of territory in the valley of the Tarantaise, and in 1091 this prince succeeded to the dignities of his grandmother Adelaide, when he assumed the title of prince of Piedmont. AMADEUS III came to the throne in 1103, and in 1111 his states were created counties of the empire by Henry V. On his way home from the crusades in 1149 Amadeus died at Nicosia, and was succeeded by his son HUMBERT III. This prince did not follow the example of Amadeus II, but took the part of the pope against Barbarossa, who accordingly ravaged his territories until Humbert's death in 1188. The guardians of his son THOMAS acted more discreetly, and reconciled their ward and the emperor. He remained Ghibelline all his life, and received from Henry VI accessions of territory in Vaud, Bugey, and Valais, with the title of imperial vicar in Piedmont and Lombardy. He was followed in 1233 by AMADEUS IV, whose wife was the beautiful Cecilia of Beaux, surnamed *Passo Rose*. A campaign against the inhabitants of Valais ended in the annexation of their district, and his support of Frederick II. against the pope caused the erection of Chablais and Aosta into a duchy. In 1253 his son BONIFACE succeeded to his states at the age of nine, but, after giving proofs of his valour by defeating the troops of Charles of Anjou before Turin, he was taken prisoner and died of grief (1263).

The Salic law now came into operation for the first time, and PETER, the uncle of Boniface, was called to the throne. This prince, on the marriage of his nieces Eleanor and Sancho of Provence with Henry III of England and Richard, earl of Cornwall, had visited England, where he had been created earl of Richmond, and built a palace in London afterwards called Savoy House. His brothers Boniface and William were also appointed, the former to the see of Canterbury, and the latter to the presidency of the council. In return he recognized the claims of Richard to the impe-

Genealogical Table of the House of Savoy

rial throne, and received from him Kyburg in the diocese of Lausanne, conveniently near to the county of Geneva, which had been willed to him by the last count. But this increase of territory only brought new anxieties, for Peter's short reign was occupied in reducing refractory vassals to obedience. At his death in 1268 he was succeeded by his brother PHILIP I., who died in 1285, when their nephew AMADEUS V. came to the throne. This prince, surnamed the Great, united Bugey and Bresse to his states in right of his wife Sibylla, and later on Lower Faucigny and part of Geneva. For his second wife he married Mary of Erabant, sister of the emperor Henry VII., from whom, in reward for his services in North Italy, he received the seignury of Aosta. His life was passed in continual and victorious warfare, and one of his last exploits was to force the Turks to raise the siege of Rhodes. In commemoration of his victory it is said that he substituted for the eagles in his arms the letters F.E.R.T. (*Fortitudo eius Rhodum tenuit*). He died in 1325 while making preparations for a campaign in aid of his nephew, the emperor of the East. His son EDWARD succeeded him, and, dying in 1329, was followed by his brother AYMON. This prince died in 1343, when his son AMADEUS VI. ascended the throne. His reign was, like his grandfather's, a series of petty wars, from which he came out victorious and with extended territory, until, accompanying Louis of Anjou on his expedition against Naples, he died there of the plague (1383). The reign of his son AMADEUS VII. promised to be as glorious as those of his ancestors, but it was cut short by a fall from his horse in 1391. Before his death, however, he had received the allegiance of Barcelonnette, Ventimiglia, Villafranca, and Nice, so gaining access to the Mediterranean.

His son AMADEUS VIII. now came to the throne, under the guardianship of his grandmother Bonne de Bourbon. On attaining his majority he first directed his efforts to strengthening his power in the outlying provinces, and in this he was particularly successful. The states of Savoy now extended from the Lake of Geneva to the Mediterranean, and from the Saône to the Sesia. Its prince had therefore considerable power, and Amadeus threw all the weight of this on the side of the emperor Sigismund was not ungrateful, and in 1416 erected the counties of Savoy and Piedmont into duchies. At this time too the duke recovered the fief of Piedmont, which had been granted to Philip, prince of Achaia, by Amadeus V., and his power was thus thoroughly consolidated. The county of Vercelli afterwards rewarded him for joining the league against the duke of Milan, but in 1434 a plot against his life made him put into execution a plan he had long formed of retiring to a monastery. He accordingly made his son Louis lieutenant-general of the dukedom, and assumed the habit of the knights of S. Maurice, a military order he had founded at the priory of Rupaille. But he was not destined to find the repose he sought. The prelates assembled at the council of Basel voted the deposition of Pope Eugenius IV., and elected Amadeus in his place. Felix V., as he was now called, then abdicated his dukedom definitively, but without much gain in temporal honours, for the schism continued until the death of Eugenius in 1447, shortly after which it was healed by the honourable submission of Felix to Nicholas V. The early years of LOUIS's reign were under the guidance of his father, and peace and prosperity blessed his people, but he afterwards made an alliance with the dauphin which brought him into conflict with Charles VII. of France, though a lasting reconciliation was soon effected. His son AMADEUS IX. succeeded in 1465, but, though his virtues led to his beatification, his bodily sufferings made him assign the regency to his wife Yolande, a daughter of

Charles VII. He died in 1472, when his son PHILIBERT I. succeeded to the throne and to his share in the contests of Yolande with her brother and brother-in-law, who tried to deprive their nephew of his rights. His reign lasted only ten years, when he was succeeded by his brother CHARLES I. This prince raised for a time by his valour the drooping fortunes of his house, but he died in 1489 at the age of thirty-one, having inherited from his aunt, Charlotte of Lusignano, her pretensions to the titular kingdoms of Cyprus, Jerusalem, and Armenia. He was succeeded by his son CHARLES II., an infant, who, dying in 1496, was followed by PHILIP II., brother of Amadeus IX. He died in 1497, leaving PHILIBERT II., who succeeded him, and CHARLES III., who ascended the throne on his brother's death in 1504. In spite of himself Charles was drawn into the wars of the period, for in the quarrel between Francis I. and the pope he could not avoid espousing the cause of his nephew. But the decisive victory of Francis at Marignano gave the duke the opportunity of negotiating the conference at Bologna which led to the conclusion of peace in 1516. So far well, but Charles was less fortunate in the part he took in the wars between Francis I. and Charles V., the brother-in-law of his wife. He tried to maintain a strict neutrality, but his attendance at the emperor's coronation at Bologna in 1530 was imperative in his double character of kinsman and vassal. The visit was fatal to him, for he was rewarded with the county of Asti, and thus so displeased the French king that, on the revolt of Geneva to Protestantism in 1532, Francis sent help to the citizens. Bern and Freiburg did likewise, and so expelled the duke from Lausanne and Vaud. Charles now sided definitely with the emperor, and Francis at once raised some imaginary claims to his states. On their rejection the French army marched into Savoy, and, finding the pass of Susa unfortified, descended on Piedmont and seized Turin (1536). Charles V. came to the aid of his ally, and invested the city, but, being himself hard pressed, was obliged to make peace. France kept Savoy, and the emperor occupied Piedmont, so that only Nice remained to the duke. On the resumption of hostilities in 1541 Piedmont again suffered. In 1544 the treaty of Crespy restored his states to Charles, but the terms were not carried out and he died of grief in 1553. His only surviving son EMMANUEL PHILIBERT succeeded to the rights but not the domains of his ancestors. Since 1536 he had attached himself to the service of the emperor, and had already given promise of a brilliant career. On the abdication of Charles V. the duke was appointed governor of the Low Countries, and in 1557 the victory of St. Quentin marked him as one of the first generals of his time. Such services could not go unrewarded, and the peace of Cateau-Cambresis restored him his states, with certain exceptions still to be held by France and Spain. One of the conditions of the treaty also provided for the marriage of the duke with the lovely and accomplished Margaret of France, sister of Henry II. The evacuation of the places held by them was faithfully carried out by the contracting powers, and Emmanuel Philibert occupied himself in strengthening his military and naval forces, until his death in 1580 prevented the execution of the ambitious designs he had conceived. His son CHARLES EMMANUEL I., called the Great, being prevented by Henry III. from taking Geneva, threw in his lot with Spain, and in 1590 invaded Provence and was received by the citizens of Aix. His intention was doubtless to revive the ancient kingdom of Arles, but his plans were frustrated by the accession of Henry IV. to the throne of France. After effecting with Henry an exchange of Bresse and Bugey for the marquessate of Saluzzo he kept up an intermittent war with him until 1609, when, disgusted with the

behaviour of Spain, he made a treaty with France against Philip. But he could not remain faithful for long, and, siding first with one and then with the other, he found himself in almost the same straits as his grandfather, when death put an end to his ambitions and failures in 1630. The first care of his son VICTOR AMADEUS was to free himself from the double burden of his enemy and his ally, so he concluded peace in 1631. In 1635, however, Richelieu determined to drive the Spaniards out of Italy, and offered the duke the alternatives of war or Milan. He gave but a half-hearted assent to the schemes of France, and, without gaining Milan, died in 1637, leaving by his wife Christina of France Francis Hyacinth, a minor, who only survived till the following year, and CHARLES EMMANUEL II, whose legitimacy was unfortunately rather doubtful. The regency of Christina resembled that of Yolande in the same need for guarding her son's interests against the pretensions of his uncles, Louis XIII and the princes of Savoy. But fortune favoured her, and on the duke's reaching his majority in 1648 the wars of the Fronde occupied all the attention of Mazzini. The brunt of the conflict with Spain consequently fell upon Savoy, and was borne not ingloriously until the conclusion of peace. Charles Emmanuel occupied the remaining part of his reign in repairing the ravages caused by twenty-four years of warfare, and died in 1675, leaving an only son, VICTOR AMADEUS II, whose minority was as peaceful as his father's had been the reverse. He married Mary of Orleans, the daughter of Henrietta of England, and consequently the legitimate heiress to the English crown on the death of Anne and on the exclusion of the Pretender. For a time he united with Louis XIV. in persecuting the Protestants, but the overbearing behaviour of his ally made him join the coalition of Augsburg in 1690. His campaign against Louis was carried on with varying results until 1695, when he accepted proposals of peace. This defection led to the peace of Ryswick in 1697, and in reward he received from Louis the territories then occupied by France. In 1700 he sided with France against Austria, but, an extension of territory in the Milanese not being granted by Louis, he went over to the enemy in 1703. The generalship of his relative Prince Eugene proved too much for the French, and in 1706 they were defeated before Turin and driven across the frontier. The peace of Utrecht afterwards confirmed the duke in the possession of the places granted on his joining the coalition, including the long-coveted Montferrat, and endowed him besides with the crown of Sicily. Austrian influences now replaced Spanish in the peninsula, and Charles VI persuaded him to exchange his kingdom for that of Sardinia. This was accordingly effected in 1720 by the treaty of Madrid, and afterwards proved the very salvation of the house of Savoy. In 1730 the king abdicated in favour of his son, in order to marry the countess of San Sebastian, at whose instigation he afterwards tried to regain the crown, but he died in 1732.

CHARLES EMMANUEL III continued his father's intrigues to obtain possession of Milan, and joined the league of France and Spain against Austria in 1732. But he used the victories of the allied forces over the imperialists in such a half-hearted way that it seemed as if he did not wish to break finally with Austria. In the end he only gained from the treaty, which he signed in 1739, the Novarese and Tortona, instead of Milan. The death of Charles VI in 1740 gave him the chance of expelling the Austrians from Italy, but, though he at first claimed Milan from Maria Theresa, he ended in 1742 by espousing her cause. The complete defeat of the French in 1747 led to the treaty of Aix-la-Chapelle, by which Charles Emmanuel received the Upper Novarese and Vigevano, after which he remained at peace until his death in 1773. His son

VICTOR AMADEUS III succeeded him, and devoted the early years of his reign to the improvement of the administration and the reorganization of his army. The time soon came for him to use the weapon he had created, and on the outbreak of the Revolution in France he headed the coalition of Italian princes against her. The house of Savoy thus assumed the headship of Italy, but for the time without much gain, for Napoleon's brilliant victories of 1796 ended in the peace of Paris, by which Savoy, along with Nice, was given to France. Victor Amadeus died shortly afterwards, and was succeeded by his son CHARLES EMMANUEL IV. The fever of the Revolution spread to Piedmont, and in 1798 nothing was left to the king but to retire to Sardinia. In 1802 he abdicated in favour of his brother, VICTOR EMMANUEL I, who, in his island kingdom, protected by the English fleet, became the symbol of the coalition against France. The king returned to Turin in 1814, and in the following year took possession again of Savoy. The anti-revolutionary measures which were adopted by the Italian princes on their return caused a spirit of rebellion to spring up among their subjects. The freedom of the individual and the unity of the nation thus came to be considered objects to be attained at one and the same time. The influence of Austria was paramount in the Peninsula, but an insurrection broke out at Turin in 1820 demanding war with her, and, rather than embroil himself both with his people and with Austria, Victor Emmanuel abdicated in favour of his brother, CHARLES FELIX. The general insurrection was suppressed, and for the next few years Italy suffered everything possible at the hands of various petty princes, whose fears and weakness left them no weapon but persecution. In 1831 Charles Felix died without issue, and in him the elder branch of the family ended. He was succeeded by CHARLES ALBERT, of the line of Savoy-Carignano, which was founded by Thomas Francis, son of Charles Emmanuel the Great, and grandfather of Prince Eugene. The first care of Charles Albert was to reorganize his military and naval forces in readiness for the conflict with Austria which he foresaw. At the same time he put down the conspiracies which would have forced his hand, among which the most famous was that of Mazzini and Ramorino in 1834. The French revolution of 1848 fanned the embers of Italian patriotism, and Charles Albert, without any aid, began the War of Independence. Victory at first followed his arms, but he was defeated at last by the Austrians at Custoza. In the next year he was again driven into war with the Austrians, and, after his defeat at Novara, he abdicated in favour of his son, VICTOR EMMANUEL II. From this point the history of the house of Savoy has been told in the article ITALY (vol xiii pp 469 sq). (H V B)

SAVOY For the French departments of Savoy and Upper Savoy see SAVOIE and SAVOIE, HAUTE.

SAW See SAWS.

SĀWANTWĀRI, or SĀWUNTWARRIE, a native state forming the southern part of the Concan division of the Bombay presidency, India, and lying between 15° 37' and 16° 16' N lat and between 73° 36' and 74° 21' E. long. It has a total area of about 900 square miles, and is bounded on the north and west by Ratnagiri district, on the east by the Sahyādrī Mountains, and on the south by the Portuguese territory of Goa. The general aspect of the country is strikingly picturesque. Its surface is broken and rugged, interspersed with densely-wooded hills, in the valleys are gardens and groves of cocoa-nut and betel-nut palms. Sāwantwār has no rivers of any considerable size, the chief streams are the Karli on the north and the Terekhol on the south, both navigable for small craft. The climate is humid and relaxing, with an average annual rainfall of over 130 inches. The forests and wooded

slopes of the Sahyádris contain large numbers of wild animals, including the tiger, panther, leopard, bear, hyæna, &c. Snakes and other reptiles also abound. The state possesses no railway, but there is an excellent trunk road through the territory.

The census of 1891 returned the population of Sāwāntwāri at 174,433 (males 86,061, females 88,372). Hindus numbered 166,080, Mohammedans 8970, and Christians 4213. Agriculture supports the greater part of the population. The staple product is rice, but excepting rice none but the coarsest grains and pulses are raised, both soil, which is stony, and climate being against the cultivation of wheat and other superior grains, oil seeds, hemp, and pepper are also grown. The gross revenue of the state in 1883-84 amounted to about £34,000. Before the establishment of Portuguese power (1510) Sāwāntwāri was the highway of a great traffic, but during the 16th and 17th centuries trade suffered much from the rivalry of the Portuguese, and in the disturbances of the 18th century it almost entirely disappeared. Since the establishment of order under the British (1819), trade has considerably developed. The present chief being a minor, the administration has been in the hands of the British since 1869.

SAW-FISH See RAY, vol xx p 299.

SAW-FLIES (*Tentilredwidae*) This subdivision of the *Hymenoptera* is characterized by possessing a sessile abdomen which hides the base of the posterior legs. The antennæ vary in their structure and in the number of their joints. The ovipositor is modified to form two valves, which when at rest lie in a sheath formed of two valves. The larvæ resemble caterpillars, but may be distinguished

Turnip Saw-Fly (*Athalia spinarum*) Saw-Fly (magnified, with lines to left showing natural size), caterpillars, pupa, and pupa-case

by their greater number of legs, usually 9 to 11 pairs are present. When alarmed they have the habit of rolling themselves up in a spiral fashion, some also discharge a thin fluid from lateral pores situated above the spiracles. The females place their eggs in small incisions made by means of their saws in the soft parts of leaves. Usually one egg is placed in each slit. Some species merely attach their eggs in strings to the exterior of the leaves. With each incision a drop of fluid is usually excreted, which serves to excrete a flow of sap to the wounded part. The egg is said to absorb this sap, and so to increase in size. One genus (*Nematus*) alone forms galls. These occur in the young leaves of the willow, a tree which the true gall-flies do not attack. *Nematus ventricosus* resembles the bees and wasps in the fact that the parthenogenetic ova produce only males, as a rule in the animal kingdom the absence of fertilization results in the production of females.

The injury which the saw-flies inflict upon crops or young trees is almost entirely brought about by the voracious habits of the larvæ. These possess well developed mouth-appendages, by means of which they gnaw their way out of the leaf in which they have been hatched, and then eat it. In this way the Turnip Saw-Fly (*Athalia spinarum*), not to be confused with the Turnip Fly (*Phyllotreta nemorum*), attacks the leaves of the turnip, often completely consuming the leafage of acres at a time. The Pine Saw-Fly (*Lophyrus pini*) causes great damage to

plantations of young Scotch firs, devouring the buds, the leaves, and even the bark of the young shoots. Other species infest currant and gooseberry bushes, consuming the soft parts of the leaves, and leaving only the tough veins. The only effectual remedy in most cases is to collect and kill the larvæ when they first appear. Syringing the affected parts with hot water or tobacco water is also recommended.

SAWS Blades of steel with serrated edges have been used from time immemorial to rend or divide substances of various kinds, including metals and stone, and the principal modern use of the saw is to divide wood. Modern saws are of the finest steel, but the ancients used bronze saws, and among uncivilized nations saws have been made with flakes of flint imbedded in a wooden blade, and held in place by means of bitumen (see Grimshaw, *History, &c., of Saws*), while obsidian has been used by the Mexicans, and shark's teeth and even notched shells form the saws of certain savage islanders. The pyramid-builders in Egypt cut granite and other hard stones by means of bronze saws set with jewels (see vol xx p 124).

Space would fail to describe minutely the various adaptations of the saw to mechanical uses. It is indispensable to the carpenter, the furniture-manufacturer, the watch-maker, and manipulator of metals. It is one of the most trustworthy tools of the surgeon's case, while without it the dentist would of necessity drop back to the barbarous customs of a past century. Iron, horn, pearl, india-rubber, and the thousand and one conveniences of civilized life are dependent upon this useful instrument, which is but an exaggeration after all of the sharpest of knives, whose edge when examined under the microscope exhibits an array of saw teeth so minute as to present a smooth plane to the unassisted eye. As the chief use of the tool is to saw wood, the enormous timber industry of America has given an impetus to the improvement of the saw and its manufacture, which has no parallel elsewhere.

Saws may be classified as (1) straight (reciprocating in action), having a flat blade and straight edge, making a plane cut, or (2) circular or disk-like, cutting at right angles to the motion, or (3) cylindrical or barrel-shaped, with a convex edge cutting parallel to its axis, or (4) band-saws, being a continuous ribbon or band running upon an upper and lower pulley, making a plane or curved cut, with a straight edge parallel to the axis of motion. The oldest and commonest, with the widest range of adaptability, is the straight saw, with reciprocating rectilinear blade. In this class is included the ordinary hand-saw with its varying range of uses from fine to coarse and from rip to cross cut, and with teeth of forms as various as are the different duties which it is calculated to perform. The teeth are long or short, cutting one way or both ways according to the "pitch" or set, which may be given, and which should be adapted to both the kind and character of the timber to be sawn. The "pitch" of a saw-tooth is the angle of the point with reference to the blade, and is found by subtracting the back angle from the front, 60° being the generic angle of saw-teeth, which, however, may be variously placed. From the smallest hand-saw to the largest "mill-saw" the same general rules apply. In the largest saws of this class may be named the "pit-saw," in the earliest manufacture of which the timber is grown, and worked by one person standing over the log and drawing upward while another in the pit below follows with the downward or cutting thrust. From the pit-saw we advance to the "gate-saw" used in the earlier adaptation of motive power to the cutting of timber, thence to the "muley-saw," suspended without strain upon a pitman beneath, having its upper end hung in slides pendulous from a heavy beam above. These saws must of necessity be thick, to sustain the heavy thrusts which they are expected to endure, and are consequently of "heavy gauge," this being based upon the different sizes of wire, the largest gauge representing the

¹ According to some writers the term "muley" (or muley) is derived from the German "Mühlsgge," mill-saw, but, as this form of saw, when introduced, differed only from the ordinary mill-saws long in use in the manner in which it was hung (free from strain), the name may have been given to signify "hornless," indicating the absence of the ponderous gate which was the essential feature of strained saws.

thinner blade, e. g., a 4-gauge saw is much thicker than an 8-gauge. From the necessity for more rapid production grew the "gang-saw," a modification of the gate, differing from it only in length and thickness (less than one-third the thickness of the ordinary gate-saw and but about two thirds its length). A large number of these, varying from 2 to 40, are strained in a gate or frame, at such distances apart as the thickness of lumber demands, and the log is wholly made into boards in one operation. Of the reciprocating class of saws is the "cross-cut," used for cutting across the grain of the timber or wood to be converted into shorter lengths. The length, breadth, "pitch," and "set" of saws vary according to the use which is to be made of them and the kind of timber which is to be manipulated. In a cross-cut saw the cutting edge strikes the fibre at right angles to its length, and while its pitch is but slight (if any) it must sever from each side before dislodging the sawdust. "A slitting or ripping saw has the cutting edge about at a right angle to the fibre of the wood, severing it in one piece,—the throat of the tooth wedging out the piece." In slitting saws the "rake" is all in front, in the cross-cut on the side.

The circular saw is of comparatively recent origin, its introduction dating from 1790, when Brunel first announced the principle. At first only circular saws of small diameter were used, but from the small "buzz-saw" of the watchmaker and fine metal worker, or the ripping saw of the planing-mill or carpenter shop, where small diameters have to be divided, the circular saw has passed to the saw-mill, where, in diameters of from 12 to 30 inches, it is the needful instrument for edging or ripping the lumber which drops from the log in an imperfect condition, requiring finer manipulation to prepare it for market, or in diameters of from 40 to 84 inches it may be found as the main saw of the mill for rendering the logs as they come from the forest into shapes and sizes adapted for the various purposes of the builder. It is capable of dividing logs into boards one inch thick or upwards at as high a rate as 80,000 superficial feet in a day of twelve hours, while a straight (muley or gate) saw would give only 5000 to 8000 feet. In the chief lumber sections of the United States saws of 60 inches diameter are in most common use, upon the Pacific coast saws of 8 feet diameter are not unknown. Attempts to work large circular saws in nests or gangs have not hitherto proved successful, but three, four, or five saws of 30 inches diameter hung on a single shaft or "arbor" may be used to trim and divide the boards or planks thrown off from a log.

Barrel saws, for the manufacture of staves for barrels, pails, or tubs, are in the form of straight-edged blades with both heads removed, and the stave ends of one head sciated.

For the manufacture of veneers, where valuable timber is to be economically manipulated, we have the segment-saw, constructed by bolting segments of saw-blades upon the outer rim of a cast-iron centre, forming a circular saw of the desired diameter, but with a cutting edge of so light a gauge as to waste but little of the valuable timber to be sawed. The cast-iron centre insuring the requisite stiffness and strength. With these saws veneers scarcely thicker than a sheet of paper may be cut, the width being according to the size of the log, such saws are often from 80 to 100 inches in diameter.

Circular saws of the larger size are often constructed with "matted" teeth. A disk of steel of suitable size, having slots cut in its periphery of the exact size and shape of the tooth which is to be inserted, may have these teeth removed as often as the wear upon them may require, without reducing the diameter of the plate. The teeth of lumber saws have to be sharpened with the file at least three or four times in twelve hours' work, and a saw of five feet in diameter is rapidly reduced in size with a great loss of efficiency. In the inset tooth plate new teeth cost only about three cents ($\frac{1}{3}$ ¢) each, and the saw plate remains at its original diameter. In the past few years (1884) are successful endeavors have been made to adapt them to lumber manufacture. The band-saw is a continuous blade or ribbon running over pulleys above and below, forming a "steel belt" whose serrated edge is always "in the cut." These saws are usually from a half inch in width (for shop work) to six and eight inches wide for the heavier work of the saw-mill, and in the latter have a cutting capacity of from 90,000 to 40,000 superficial feet in twelve hours. They are extremely thin (usually 18-gauge) and the kerf produced is so much less than that of the upright or the circular that a saving of at least 20 per cent of timber is claimed in their use.

Saws used by surgeons, butchers, and in all branches of manufacture are but modifications of one of the varieties above described, and do not demand more extended description.

Saw-Mills are factories for the conversion of forest trees Saw-into lumber and timber. The earliest form of saw-mill mills was unquestionably the saw-pit, still found in a modified form in shipbuilders' yards, the log being raised on trestle horses instead of one of the sawyers being sunk in the pit. Saws were run by windmill-power as early as the 13th century, and the use of water-power soon followed. The primitive water saw-mill consisted of a wooden pitman attached to the shaft of the water-wheel, the log to be sawed being placed on rollers sustained by a framework over the wheel, and being fed forward on the rollers by means of levers worked by hand. Good authorities mention saw-mills running by water-power in Germany as early as 1322. In 1663 an attempt to establish a mill in England was abandoned owing to the opposition of the sawyers, and no further attempt was made till 1768, when a mill was erected at Limehouse, but was soon destroyed by a mob. North America, with its vast forests, may be aptly termed the home of saw-mills. As early as 1634 a saw-mill was erected at the falls of the Piscataqua, near the line dividing Maine from New Hampshire. This was no doubt the pioneer of the vast array of mills which subsequently made Maine famous as a lumber-producing State for many years. From about the same date several mills were erected along the Atlantic coast of America, a description of one being that of all. In these mills the saw was attached by a long pitman from the wheel shaft to a ponderous gate, running in wooden slides upon two heavy posts, crossed above by a beam connecting the two sides of the mill-frame. The mill-carriage on which the log lay was pushed towards the saw by a rack and pinion, &c., moved by a feed-wheel. The daily capacity of these mills was from 500 to 1500 superficial feet. The first great improvement upon this class of mills was in the introduction of two or more saws to the gate, the general character of the methods remaining the same. With the demand for more rapid production came improvements in the "gang" feature, and the wonder of the age was the "Yankee gang," so arranged, by placing half the saws facing in one direction and the other half in the opposite, that two logs were worked up in one movement of the carriage, or, as in the "slabbing" gang, the outsides or slabs were cut from one log, which was then turned upon its flattened sides to the other set of saws which cut it into boards. The "stock" gang, "pony" gang, "slabbing" gang, and "Yankee" gang are favourites with saw-mill proprietors, because of the uniform character of the lumber produced, and the saving of timber realized from the use of saws of scarcely one-third the thickness of the gate, muley, or circular.

Gang-saws are seldom thicker than 14-gauge, and are successfully worked at 18-gauge, making a saw-kerf or waste of but $\frac{1}{8}$ inch, whereas the ordinary gate, muley, or circular takes $\frac{1}{4}$ inch. The muley was introduced later than the gang, and was received with great favour, entering into more general use because of its comparative cheapness and adaptability where the sawyer had not to deal with large quantities of lumber. The muley mill dispensed with the ponderous gate and heavy posts of the saw-frame. While the lower portion of the mill is arranged much as in the use of the gate-saw, with the addition of necessary slides, the upper end of the saw is guided in a strong iron frame pendent from the weigh-beam overhead. On each side of this frame are slides in which are placed boxes attached by a noddle pin and staple to the upper end of the saw, keeping the tool in line with the cut, and the cutting is accomplished wholly by the downward thrust, the motion of the crank beam imparting a forward motion to the blade in its cutting functions and a retracting motion as it rises from the cut. By an ingenious arrangement of the slides an increased oscillation may be imparted, the object being to cause the saw-teeth to hug the timber closer on the downward or cutting thrust, and to recede and run clear of the timber on the upward motion, thus decreasing the friction. Muley-saws are usually run at a speed of 800 revolutions of the driving wheel per minute, and the daily capacity may be stated at about 5000 superficial feet.

Water-power was used almost exclusively in saw-mills until 1835, after which year steam was rapidly substituted, until at the present time it is as difficult to find a water-power saw-mill as it is to find a gate or miller.

The use of the circular as the main saw of a mill is of comparatively recent origin, the experimental point in its introduction having been passed only about the year 1855. Since that time it has rapidly reached the highest efficiency. Driven by engines of from 25 to 100 horse-power the circular saw-mill, under proper management, turns out from 20,000 feet per day for smaller to 50,000 and 60,000 feet per day for larger mills, in addition to running the double-edges and turning saws, requisite for trimming off the rough edges and bad ends of the lumber produced.

The modern saw-mill stands upon the banks of a river or pond, at an elevation usually of twelve feet from the level of the land to the saw-floor. The logs are floated from the forest (often many hundred miles distant from the mill) down the river, in lengths as desired.

Piling driven at convenient distances in the water serves to hold the long pieces of timber, which, secured to the piles by heavy chains, form a strong "boom," floating into which the logs are penned or "boomed" until required. From the rear end of the mill, at the second story or saw-floor, a "jack ladder" is constructed of heavy timber, the lower ends resting in the bottom of the stream upon a bed of timber heavily weighted. Upon the sides of the boom, the log is laid upon a track for the log car, which, strongly constructed and with its top across sections or "banks" heavily studded with headed bolts, is run under the water at a depth to allow the log to float over it in such manner that, as the chain running to the "bull-wheel" in the mill is wound up, the spikes of the car catch upon the under-side of the log or logs, which thus load themselves and are hauled up the incline upon the floor. The skids leading to the saw-carriage, and are soon running rapidly their course of manufacture. Loaded upon the "head-blocks," by a quick motion of a lever upon the standard, the "setter" inserts an iron "dog," which holds the log firmly in place ready for advancing to the saw. This is accomplished by one of several methods—(1) by rack and pinion worked by "cone feed," in which a belt is moved upon a cone of rollers, the motion being rapid or a slower motion to the union shaft, (2) by "rope feed," a rope, usually of wire, being attached to each end of the mill carriage, and passing over pulleys in the floor to a drum beneath, so arranged as to be under control of the Sawyer in its feeding movement or in reversal to "give" the carriage back to its first position, or (3) by "steam feed." This is the more modern and rapid means employed, and is sometimes termed "lightning feed." A steam cylinder of small diameter is laid upon the floor of the mill beneath the saw-carriage, its piston connecting with the carriage. Steam being admitted to the driving end of the cylinder (the length of which is according to the length of timber to be sawed, sections being added or removed at pleasure) the saw carriage is driven with lightning speed, both in the cutting feed and reversing "give." Thirty ordinary cuts per minute, on 12 inches feed to the revolution of the saw, may be attained with this adaptation. As the limit of capacity for work with a circular saw is practically the ability of the operators to remove the lumber, 60,000 to 70,000 feet per day is no unusual cut, while a rate of 100,000 feet per day has been maintained (for a short period) by a single circular. The lumber as it drops from the saw falls upon "live rolls," a series of iron or wooden rollers connected by chains, which carry it with each revolution of the "edger," who rapidly passes that portion which requires "edging" or splitting through the "double-edger," to a carriage or truck on which it is pushed to the piling ground, or, in some mills, to another series of live rolls which take it to the front of the "trimmer," an ingenious arrangement of table, beneath which are several saws which advance or recede at the operator's pleasure, cutting the lumber to even and uniform lengths, or trimming off such defects as may exist in the end of the piece. Ordinary lengths are 12, 14, 16, and 18 feet, and by use of the trimmer all superfluous ends are removed, leaving each piece of uniform length with its fellows. The waste of the log, consisting of the "slabs" and edgings, are carefully gone over, and such as are suitable for that purpose go to the "lath" machines, where they are cut into strips four feet in length, 1 inch thick, and 1 1/2 inches wide, for lath and planing. In the sawing logs, imperfections are often discovered in the timber, unfitting it for ordinary uses, and in many mills it is customary to saw such timber into "cants" of usually six inches thickness. These cants are turned over to a "butting saw," where they are cut into lengths of 16 inches (in some localities 18 inches) and turned over to the shingle mill to be manufactured into shingles. Shingles are tapering pieces 1/4 inch thick at one end, and 1/2 inch at the other, and are used as a roof covering in lieu of slating or tiles. They are laid in uniform courses, with 4 1/2 to 5 inches of the butt end laid to the weather, and are good for from 20 to 30 years' wear upon a roof. An

adjunct to the circular saw is often found in a top or upper saw, overhanging the main circular a little in advance of its track, for the purpose of enabling larger logs to be handled than the diameter of an ordinary circular will permit. The upper saw cuts into the log of the main circular a line with the cut of the lower or main saw, thus increasing the depth of the cut. In California, where logs of 8 and 10 feet diameter are not unusual (larger logs being quartered by the use of gunpowder or other explosive, timber as much as 20 and even 25 feet in diameter being found in the redwood forests), an ingenious arrangement of four saws placed one higher than the other, some horizontal and others vertical, permits the handling of logs of the largest size until recently considered impracticable. A thoroughly modern saw-mill embraces all which has been said regarding the circular, with the addition of the "gang" feature, for, while a majority of the saw-mills of North America are single "circulars," many of them have a rotary upon each side of the mill floor, the log-jack being in the centre of the building rolling its logs either to the right hand or the left. The larger mills have in addition to the rotaries from one to four gangs. In these cases the log usually goes first to the circular, where the slabs of two sides are removed, leaving a flat cant, which is then transferred to the gangs. These mills are fully equipped with all the modern patent improvements. The logs are drawn from the water by an endless chain running in a V-shaped log slide, the chains being provided either with spikes or concave chains which hug the log from shipping to back to the log car, and run on in endless succession. On its arrival at the log car on the mill floor, the manipulation of a lever causes an arm or levers to rise through the floor against the side of the log, which is partially raised and thrown with considerable force upon the skids leading to the saw carriage. When one log has been sawed, another is loaded by the simple touch of a lever in the hands of the Sawyer, causing arms to rise in a similar manner upon the log, which is then ready for carriage ready for the saw. When the first slab has been removed, the Sawyer's touch of a lever brings through the floor the "nigger," a piece of strong timber, iron-bound and with sharp teeth or spikes protruding from its front face. Its motion tends slightly forward as it advances to a height of five or six feet above the floor, its spiked surface catching the side or face of the log, turning it upward in any desired position, the log being then ready to be "canted" for the gang the two opposite sides or slabs are removed, and as the last cut is complete a hook thrown over the rear end of the cant prevents its return with the saw carriage and it drops upon rolls which move it so far out of the way of the returning carriage with its fresh load as is necessary to start it in an opposite direction to the gang which is to complete its manufacture. Thus, as before, and until it shall emerge from the gang, no hand of man has necessarily touched the log. The manipulation by human intelligence has done all the work. When the log reached the carriage it was dogged, not with the old-fashioned lever dog driven by a mallet, but by the simple movement of a lever. It was brought to its proper position before the saw by nicely adjusted set works, which graduated its position to one-eighth of an inch. After the slab was removed, if another cut was required the same set works moved it forward with lightning quickness, leaving it at the exact point, to a nicety, requisite for the production of just the thickness desired for the next piece. From the water to the pile in the millyard hands have necessarily been employed in actual handling of the product only at the edge and the trimmer, and in assorting the qualities upon the tram-car which removes it from the mill. Machinery, guided by human intelligence, has done all the heavy work. The mill which is the subject of our description was recently burned at Bay City, Michigan, the yearly production of which for several years past has been 40,000,000 feet of lumber, besides shingles, lath, packets, &c., cut from the slabs and waste. The total production of the saw-mills of the United States approximates 26,000,000,000 feet annually.

The "band" saw-mill is rapidly working its way into public favour because of the economy attending its use. The band saw is a long ribbon of steel, six to eight inches in width, running over large pulleys above and below, the upper pulley running almost vertically above the lower, the saw acting as a belt between the two and as the driving power to the upper wheel. These saws are very thin and have a manufacturing capacity of from 80,000 to 40,000 feet per day, with the consumption of 25 to 40 per cent less power than is required for the ordinary circular saw, with the same daily capacity for work. The main advantage found in the use of the band-saw is in the saving of timber (20 per cent). The set works do not differ from those of rotary mills, and either cone, rope, or steam feed may be used in connexion with it.

A useful adjunct to the many saw-mills, which produce more waste than can be consumed in raising the necessary steam, is the "slab-burner" or "hell," a large furnace, usually 10 to 15 feet in height by 25 feet internal diameter, erected conveniently near the saw-mill, into which by chain carriers leading to an opening at a sufficient height from the bottom, the sawdust,

edgings, worthless slabs, and debris of the mill are conveyed, to be destroyed by fire

Shingle Mills. *Shingle Mills*.—A standard shingle is four inches wide, and all computations of quantity are based upon that width, although the individual shingle may be six or eight inches wide or as much as 18 inches, in the latter case containing 41 shingles. A shingle mill differs from a saw-mill in the adaptations of machinery. Saws of 16-gauge, 40 inches in diameter, are most commonly employed. In cases where shingle manufacture is carried on in connexion with the saw-mill, the process of preparing the blocks has already been described. A majority of the shingles manufactured, however, are made in mills built for the special purpose. Logs suitable, usually of a medium quality, are placed before a "bolting" or "dig" saw, which serves them into the required length. The block is then stripped of its bark and sap by splitting off a section of the outer circumference to the heart wood, with axes, it is next quartered, and the inside section of heart, which is never sound, removed, and then it goes to the machine for manufacture. The machines are sometimes horizontal, sometimes vertical, but all work upon the same principle, viz. that of a tilting table, allowing a thick butt and a thin point to be alternately taken. The shingles as they drop from the saw are rough-edged, and require to be "jointed," generally upon a rapidly revolving wheel, upon the face of which are secured four well-balanced knives, which, as the shingle is pressed against them, eat away the imperfect edge with great rapidity, leaving a straight smooth edge, which when laid upon a foot makes a good joint with its fellows. The edging or jointing process is often performed with small saws in place of the wheel-jointer. The shingles are usually packed in bundles containing the equivalent of one quarter thousand 4-inch pieces, and are more used for roof covering than any other material in the United States or Canada (G W H)

SAXE, MAURICE, COMTE DE (1696-1750), marshal of France, was the natural son of Augustus II of Saxony and the countess Aurora of Königsmark. An entry in the parish registers of Goslar shows that he was born in that town, 28th October 1696. In 1698 the countess sent him to Warsaw to his father, who had been elected king of Poland the previous year, but on account of the unsettled condition of the country the greater part of his youth was spent outside its limits, a yearly income being assigned him. This enforced separation from his father made him more independent of his control than he would otherwise have been, and had an important effect on the character of his future career. At the age of twelve he was present, under the direction of the count of Schlenburg, in the army of Eugene, at the sieges of Tournay and Mons and the battle of Malplaquet, but the achievements ascribed to him in this campaign are chiefly fabulous. A proposal to send him at the close of it to a Jesuit college at Brussels was relinquished on account of the strong protests of his mother, and, returning to the camp of the allies in the beginning of 1710, he displayed a courage so impetuous as to call forth from Eugene the friendly admonition not to confound rashness with valour. After receiving in 1711 formal recognition from his father, with the rank of count, he accompanied him to Pomerania, and in 1712 he took part in the siege of Stralsund. As he grew up to manhood he was seen to bear a strong resemblance to his father, both in person and character. His grasp was so powerful that he could bend a horse-shoe with his hand, and to the last his energy and endurance were unshaken by the severe bodily illnesses resulting from his many excesses. The impetuosity noted by Eugene manifested itself in his private life in a dissoluteness only slightly tempered by his generosity and good humour. In his military career during his mature years it was indicated only in his blindness to danger and his unmoved calm amidst the blackest lowerings of misfortune, for it was tempered by the "vigilance, forethought, sagacious precaution" which Carlyle notes as "angular in so dissolute a man." In 1714 a marriage was arranged between him and one of the richest of his father's subjects, the Countess von Loeben, but her immense fortune he dissipated so rapidly that he was soon heavily in debt, and, having given her more serious grounds of complaint

against him, he consented without defence to an annulment of the marriage in 1721. Meantime, after serving in a campaign against the Turks in 1717, he had in 1719 gone to Paris to study mathematics, and in 1720 obtained the office of "maréchal de camp." In 1725 negotiations were entered into for his election as duke of Courland, at the instance of the duchess Anna Ivanovna, who offered him her hand. He was chosen duke in 1726, but declining marriage with the duchess found it impossible to resist her opposition to his claims, although, with the assistance of £30,000 lent him by the French actress Adrienne Lecouvreur, his relations with whom form the subject of the drama of that name by Scibe and Legouvé, published in 1849, he raised a force by which he maintained his authority till 1727, when he withdrew and took up his residence in Paris. On the outbreak of the war in 1734 he served under Marshal Berwick, and for a brilliant exploit at the siege at Philippsburg he was in August named lieutenant-general. It was, however, with the opening of the Austrian Succession War in 1741 that he first rose into prominence. In command of a division forming the advance guard of an army sent to invade Austria, he on the 19th November surprised Prague during the night, and took it by assault before the garrison were aware of the presence of an enemy, a *coup de main* which at once made him famous throughout Europe. After capturing on the 19th April 1742 the strong fortress of Eger, he received leave of absence, and went to Russia to push his claims on the duchy of Courland, but obtaining no success returned to his command. His exploits had been the sole redeeming feature in an unsuccessful campaign, and on 26th March 1743 his merits were recognized by his promotion to be marshal of France. In 1744 he was chosen to command the expedition to England in behalf of the Pretender, which assembled at Dunkirk but did not proceed farther. After its abortive issue he received an independent command in the Netherlands, and by dexterous manoeuvring succeeded in continually harassing the superior forces of the enemy without risking a decisive battle. In the following year he made a rapid march on Tournay, and when the allies sent an army of 60,000 under the duke of Cumberland to its relief, gave them battle 11th May, without relaxing the siege, from a strongly entrenched position at Fontenoy. The contest raged from early morning till two o'clock, when, by a charge at a critical moment which annihilated a column of the enemy, fortune was decided in his favour. During the battle he was unable on account of drowsiness to sit on horseback except for a few minutes, and was carried about in a wicker basket. In recognition of his brilliant achievement the king conferred on him the castle of Chamford for life, and in April 1746 he was naturalized. The campaign of 1746 was signalized by the capture of Antwerp on the 1st June, the capture of Namur in September, and the total rout of Prince Charles at Raucoux 11th October. Having on the 12th January 1747 been made marshal-general, he in the following campaign won the victory of Lawfeldt over the duke of Cumberland, and on 16th September he stormed Bergen-op-zoom. In May 1748 he captured Maastricht after a month's siege. After the peace, he lived in broken health chiefly at Chamford, and he died there 30th November 1750.

Maurice de Saxe was the author of a work on military science, *Mes Mémoires*, described by Carlyle as "a strange military farrago, dictated, as I should think, under opium," published posthumously in 1757 (last ed. Paris, 1877). His *Lettres et Mémoires Choisis* appeared in 1784. Many previous errors in former biographies were corrected and additional information supplied in Carl von Weber's *Maurice, Graf von Sachsen, Marschall von Frankreich, nach archivalischen Quellen* (Leipzig, 1863), and in Tallandier's *Maurice de Saxe, étude historique d'après les documents des Archives de Dresde* (1865). See also Carlyle's *Frederick the Great*.

Plate V

SAXE-ALTENBURG (Germ. *Sachsen-Altenburg*), a duchy in Thuringia, and an independent member of the German empire, consists of two detached and almost equal parts, separated from each other by a portion of Reuss (junior line), and bounded on the S and W by the grand-duchy of Saxe-Weimar-Eisenach, on the N by Prussia, and on the E by the kingdom of Saxony. There are in addition 12 small exclaves. The total area is 510 square miles (about half the size of Cheshire in England), of which 254 are in the east or Altenburg division and 256 in the west or Saal-Eisenberg division. The former district, traversed by the most westerly offshoots of the Erzgebirge and watered by the Pleisse and its tributaries, forms an undulating and fertile region, containing some of the richest agricultural soil in Germany. The western district, through which the Saale flows, is rendered hilly by the beginnings of the Thuringian Forest, and in some measure makes up by its fine woods for the comparatively poor soil. The mineral wealth of Saxe-Altenburg is scanty, lignite, the chief mineral, is worked mainly in the eastern district.

According to the returns for 1883, 564 per cent. of the entire duchy was occupied by arable land, and 27½ per cent. by forests, of which four-fifths were coniferous. The chief crops were rye (49,317 acres, yielding 20,419 tons), oats (28,897 acres, 22,998 tons), barley (21,390 acres, 13,912 tons), wheat (17,490 acres, 9724 tons), and potatoes (19,570 acres, 113,209 tons). The cattle-raising and horse-breeding of the duchy are of considerable importance. In 1883 the duchy contained 9984 horses, 60,335 cattle, 20,996 sheep, 45,387 pigs, and 12,420 goats. About 85 per cent. of the population are directly supported by agriculture. The manufactures of the duchy are very varied, but none of any great importance, woollen goods, gloves, hats, porcelain and earthenware, and wooden articles are the chief products. Trade in these, and in horses, cattle, and agricultural produce, is tolerably brisk. The chief seats of trade and manufacture are Altenburg (the capital, 39,422 inhabitants in 1885), Ronneburg (5485 inhabitants in 1880), Schmolln (8394), Gossnitz (4949), and Meusewitz (3402) in the Altenburg division, and Eisenberg (3377), Roda (3469), and Kahla (2909) in the Saal-Eisenberg division. Besides these there are the towns of Lucka (1505) and Orlamünde (1461), and 449 villages, of which Russdorf (7731), in an exclave, is the largest.

Next to the two principalities of Reuss, Saxe-Altenburg is the most densely peopled part of Thuringia. In 1880 the population was 155,036, or 304 per square mile. Of these 154,187 were Protestants, 741 Roman Catholics, 33 Jews, and 75 of other sects. The population in 1836, according to a provisional return of the census of that year, was 151,129. In the west division the population (47,738) is wholly Teutonic, but in the east (111,341) there is a strong Wendish or Slavonic element, still to be traced in the peculiar manners and customs of the country-people, though these are gradually being given up. The farmers and peasant-proprietors of the east division (Altenburg-Bauern) are an industrious and well-to-do class of the duchy, and in many countries they are said to be avicious and pious-people. Their holdings are seldom divided, a custom corresponding to Bonorum-Engelium (g), though not supported by law, obtains among them, and sometimes the elder brothers are employed by the youngest as servants on the paternal farm. The destitution to which the disinherited children are often reduced by this custom is seriously prejudicial to morality. The Altenburg peasants are pleasure-loving, and in spite of their age are said to dance for very high stakes, especially at the complicated card-game of "skat," now universal in Germany, which many believe to have been invented here.

Saxe-Altenburg is a limited hereditary monarchy, its constitution resting on a law of 1831, subsequently modified. The diet consists of 30 members, elected for 3 years, of whom 9 are returned by the highest taxpayers, 9 by the towns, and 12 by the country districts. The franchise is enjoyed by all males over 25 years of age who pay taxes. The duke has considerable powers of initiative and veto. The government is carried on by a ministry of three members, of whom two administer justice and finance respectively, and the third all the other departments of home and foreign affairs. The budget for 1884-85 estimated the yearly income at £127,180 and the yearly expenditure at £125,530. The Altenburg troops are united with the contingents of Schwarzburg, Rudolstadt, and the two Reusses to form the 7th Thuringian infantry regiment of the imperial army. Saxe-Altenburg has one vote in the Reichstag and one in the federal council.

After the conquest of the Winds, the present Altenburg district became an imperial possession, lying partly in the Pleissenau and partly in the Vogtland, while the west district was divided among

a number of small nobles. The margrave of Saxony obtained permanent possession of Altenburg about 1229, and the west division was also early incorporated with his dominions. Both districts were among the lands assigned to the Ernestine line of the house of Saxony by the convention of Wittenberg in 1547 (see Saxony). From 1608 till 1672 there existed an independent duchy of Altenburg, but in 1689, when the present division into the four Saxon duchies was made, both Altenburg and Eisenberg belonged to Gotha. Duke Frederick, who exchanged Saxe-Hildburghausen for the present duchy of Saxe-Altenburg in 1826, was the founder of the reigning line. A constitution was granted in 1831 in answer to popular commotion, and greater concessions were extorted by more threatening disturbances in 1848. The second duke (Joseph) abdicated in 1848 in favour of his brother George. Under Ernest, who succeeded his father as fourth duke in 1853, a period of violent reaction set in, so that even now the constitution is considerably less liberal than it was in 1849. In 1873 the long-disputed question as to the public domains was settled, two-thirds of these being now regarded as belonging to the duke in *fiduciam* and in lieu of a civil list.

SAXE-COBURG-GOTHA (Germ. *Sachsen-Coburg*—See *Gotha*), a duchy in Thuringia, and an independent member Plate V of the German empire, consists of the two formerly separate duchies of Coburg and Gotha, which lie at a distance of 14 miles from each other, and of eight small scattered exclaves, the most northerly of which is 70 miles from the most southerly. The total area is 760 square miles (about 2 square miles more than the county of Surrey in England), of which 217 are in Coburg and 543 in Gotha. The duchy of Coburg is bounded on the S.E., S., and S.W. by Bavaria, and on the other sides by Saxe-Meiningen, which, with part of Prussia, separates it from Gotha. The considerable exclave of Kongsberg in Bavaria, 10 miles south, belongs to Coburg. Lying on the south slope of the Thuringian Forest, and in the Franconian plain, this duchy is an undulating and fertile district, reaching its highest point in the Senichshöhe (1716 feet) near Mersdorf. Its streams, the chief of which are the Itz, Steinach, and Rodach, all find their way into the Main. The duchy of Gotha, more than twice the size of Coburg, stretches from the south borders of Prussia along the northern slopes of the Thuringian Forest, the highest summits of which (Grosse Beerberg, 3225 feet, Schneekopf, 3179 feet, Inselberg, 2957 feet) rise within its borders. The more open and level district on the north is spoken of as the "open country" ("das Land") in contrast to the wooded hills of the "forest" ("der Wald"). The Gera, Hersel, Unstrut, and other streams of this duchy flow to the Werra or to the Saale.

In both duchies the chief industry is agriculture, which employs 33 per cent. of the entire population. According to the returns for 1883, 53½ per cent. of the area was occupied by arable land, 10 per cent. by meadow-land and pasture, and 30 per cent. by forest. In the same year the chief crops were oats (43,715 acres, yielding 19,229 tons), barley (37,387 acres, 20,148 tons), rye (29,077 acres, 12,048 tons), wheat (24,255 acres, 9,272 tons), and potatoes (24,546 acres, 114,695 tons). A small quantity of hemp and flax is raised (less than 1000 acres of each), but a considerable quantity of fruit and vegetables is annually produced. Cattle-breeding is an important resource, especially in the valley of the Itz in Coburg. In 1883 the two duchies contained 3187 horses, 58,196 cattle, 78,249 sheep, 51,549 pigs, and 27,015 goats. The mineral wealth of Saxe-Coburg-Gotha is insignificant, small quantities of coal, lignite, ironstone, millstone, &c., are annually raised. There are also salt-works and some deposits of potter's clay.

The manufactures of the duchies, especially in the mountainous parts less favorable for agriculture, are tolerably brisk, but there is no large industrial centre in the country. Iron goods and machinery, safes, glass, earthenware, chemicals, and wooden articles, including large quantities of toys, are produced, and various branches of textile industry are carried on. Ruhla (two-fifths of which is situated in Saxe-Weimar-Eisenach) is famous for its meerschaum pipes and cigar-holders, which are exported to all parts of the world, and the maps of Fiebig's geographical institute at Gotha may also be reckoned among the national products. Coburg (15,791 inhabitants in 1881) and Gotha (28,100 in 1885) are the chief towns of the duchies, to which they respectively give name, the latter is the capital of the united duchy. There are seven other small towns, and 230 villages and hamlets. The villages of Fried-

rudroda and Ruhla and the Inselberg and Schneekopf and other picturesque points annually attract an increasing number of summer visitors and tourists. Neudendorf or Gudensthal is a Moravian settlement founded in 1742.

The population in 1880 was 194,716, or 256 per square mile, of whom 56,723 (261 per square mile) were in Coburg and 137,993 (254 per square mile) in Gotha. In the former duchy the people belong to the Franconian and in the latter to the Thuringian branch of the Teutonic family. In 1880 there were 192,025 Lutherans, 2662 Roman Catholics, 460 Jews, and 139 others. In 1885 the population was 193,717,—57,355 in Coburg and 141,362 in Gotha.

Saxe-Coburg-Gotha is a limited hereditary monarchy, its constitution resting on a law of 1852, modified in 1874. For its own immediate affairs each duchy has a separate diet. In Coburg of 11, in Gotha of 19 members, but in more important and general matters a common diet, formed of the members of the separate diets, meeting at Coburg and Gotha alternately, exercises authority. The members are elected for four years, the franchise is extended to all male taxpayers of twenty-five years of age and upwards. The ministry has special departments for each duchy, but is under a common president. In finance the duchies are also separate, the budget in Coburg being voted for a term of six years, and in Gotha for four years. After long disputes, between the duke and the Government a compromise was effected in 1856, by which the greater part of the public lands is regarded as a *fideicommissum* in the possession of the reigning duke, while the income from the rest is regarded as state-revenue. There are thus two budgets for each duchy. The annual income of the public lands in Coburg is estimated for the period 1856-82 at £20,700, and the expenditure at £11,900, in Gotha (period 1856-80) the same income is estimated to yield £102,021 and to cost £101,906,—together producing a surplus of £40,426, of which the duke receives £29,700 and the state-treasury £19,725. The annual state-revenue in the same periods was estimated for Coburg at £51,520, or £2246 more than the estimated expenditure, and in Gotha at £108,020, or £2244 more than the expenditure. Besides the civil list the dukes of Saxe-Coburg-Gotha enjoy a very large private fortune, augmented chiefly by Ernest I. who sold the principality of Leuchtenberg to Prussia in 1834 for an annual payment of £12,000. The congress of Vienna had bestowed the principality upon him in recognition of his services in 1813. The house of Saxe-Coburg-Gotha is directly connected with five of the royal houses of Europe, and the actual rulers or the heirs of these kingdoms trace their descent from it. The succession is hereditary in the male line, and by the deed of mortmain of 1856 the heir to the throne is the duke of Edinburgh, heir-apparent of the present duke.

History.—The elder line of Saxe-Coburg was founded in 1680 by Albert, the second son of Ernest the Pious. On his dying childless in 1699, however, the line became extinct, and his possessions became the subject of vehement contention amongst the other Saxon houses, until they were finally distributed at the end of the 18th century. The present reigning family is the posterity of John Ernest, the seventh son of Ernest the Pious, who originally ruled in Saxe-Saalfeld. His two sons, ruling in common, acquired possession of Coburg, and, changing their residence, styled themselves dukes of Saxe-Coburg-Saalfeld. Under the son and successor of the survivor (who introduced the principle of primogeniture), Ernest Frederick I. (1764-1800), the land was plunged into bankruptcy, so that an imperial commission was appointed on his death to manage the finances. The measures adopted to reform the country's credit were successful, but imposed so much hardship on the people that a rising took place, which had to be quelled with the aid of troops from the electorates of Saxony. The duke Francis Frederick Antony died in December 1806, and was succeeded by his son Ernest III. (1806-1844), although the country was occupied by the French from 1807 until the peace of Tilsit in 1816. In the redistribution of the Saxon lands in 1806, Ernest resigned Saalfeld to Meiningen, receiving Gotha in exchange and assuming the title of Ernest I. of Saxe-Coburg-Gotha. The line of Saxe-Gotha had been founded in 1680 by the eldest son of Ernest the Pious, and had become extinct in 1825. When Ernest II. (b. 1818) succeeded in 1844 both the public finances and the private fortune of the ducal family (see above) were flourishing. In his reign various liberal reforms have been achieved, and the union of the duchies has been made closer.

See Plate V. **SAXE-MEININGEN** (Germ. *Sachsen-Meiningen*), a duchy in Thuringia, and an independent member of the German empire, consists chiefly of an irregular crescent-shaped territory, which, with an average breadth of 10 miles, stretches for over 80 miles along the south-west slope of the Thuringian Forest. The convex side rests upon the duchy of Coburg, and is in part bounded by Bavaria, while the concave side, turned towards the north, contains portions of four other Thuringian states and Prussia be-

tween its horns, which are 46 miles apart. The districts of Kranichfeld, 15 miles north-west, and Kamburg, 22 miles due north of the eastern horn, together with a number of smaller scattered exclaves, comprise 74 of the 953 square miles now belonging to the duchy (about the size of county Down in Ireland). The surface on the whole is hilly, and is partly occupied by offshoots of the Thuringian Forest, the highest summits are the Kieselee (2851 feet) and the Bless (2834 feet). The chief streams are the Werra, which traverses the south and east of the duchy, and various tributaries of the Main and the Saale, so that Saxe-Meiningen belongs to the basins of the three great rivers Weser, Rhine, and Elbe.

The soil is not very productive, although agriculture flourishes in the valleys and on the level ground, grain has to be imported to meet the demand. In 1888 only 41.8 per cent of the total area (in 1878, 41.6) was devoted to agriculture, while meadow land and pasture occupied 11 per cent. The chief grain crops in 1888 were rye (44,442 acres, yielding 10,112 tons), oats (42,447 acres, 17,845 tons), wheat (25,252 acres, 9038 tons), and barley (10,016 acres, 94,456 tons). The cultivation of potatoes is very general (31,006 acres, 143,327 tons). Tobacco, hops, and fax (in 1883, 397 acres) are also raised. The Weald and the other fertile valleys produce large quantities of fruit. Sheep and cattle raising is a tolerably important branch of industry throughout the duchy, horses are bred in Kamburg. In 1888 Saxe-Meiningen contained 6174 horses, 66,738 cattle, 68,940 sheep, 45,136 pigs, and 26,817 goats. The extensive and valuable forests, of which 75 per cent are coniferous trees, occupy 41.9 per cent of the entire area. Nearly one half of the forests belong to the state and about one-third to public bodies and institutions, leaving little more than a sixth for private owners. The mineral wealth of the duchy is not inconsiderable. Iron, coal, and slate are the chief minerals worked. There are salt-works at Salzungen and Sulza, the former the most important in Thuringia, and the mineral water of Friedrichshall is well known. The manufacturing industry of Saxe-Meiningen is very active, especially in the districts of Sonneberg, Gräfenhain, and Saalfeld. Iron goods of various kinds, glass and pottery, school-slates, malleable iron, are produced. The abundant timber fosters the manufacture of all kinds of wooden articles, especially toys, and textile industry is also carried on to a slight extent.

The capital of the duchy is Meiningen (in 1881 11,227 inhabitants). Of the sixteen other towns (Salzungen, Wassenen, Hildburghausen, Saalfeld, Sonneberg, Saalfeld, Füssen, Kamburg, &c.) none has so many as 10,000 inhabitants. There are 329 villages and hamlets. In 1880 the population was 307,075 (217 per square mile), of whom 80 per cent lived in communities of more than 2000. As in the other Saxon duchies the population is almost exclusively Lutheran, in 1888 202,970 belonged to that confession, 2274 were Roman Catholics, 204 of other Christian sects, and 1627 Jews.

Saxe-Meiningen is a limited monarchy, its constitution resting on a law of 1858, subsequently modified. The diet, elected for six years, consists of 24 members, of whom 4 are elected by the largest landowners, 4 by those who pay the highest personal taxes, and 16 by the other electors. The franchise is enjoyed by all domiciled males over twenty-five years of age who pay at least a minimum of taxes. The government is carried on by a ministry of five, with departments for the ducal house and foreign affairs, home affairs, justice, education and public worship, and finance. The returns of the state-lands and the ordinary state-revenue are treated in separate budgets. The estimate for the period 1884-86 puts the annual income from the former at £105,840 and the annual expenditure at £77,915, while the annual income and expenditure of the latter are balanced at £145,148. Half of the surplus of £27,425 is credited to each fund. The duke's civil list of £17,714 (894,286 marks) is paid out of the returns from the state-lands, at one time in the possession of the reigning house. Saxe-Meiningen has one vote in the federal council and sends two deputies to the reichstag.

The original territory of the duchy of Saxe-Meiningen, founded in 1680 by Bernhard, third son of Ernest the Pious, consisted of what is now the western horn of the duchy, from Henneberg northwards. Bernhard was succeeded in 1706 by his three sons, but by 1746 the only survivor was the youngest, Antony Ulrich, who reigned alone until his death in 1768. The duchy had meanwhile been considerably increased in extent, but contentions and petty wars with the other Saxon monarchs on questions of inheritance, the extravagance of the court, and the hardships of the Seven Years' War plunged it into bankruptcy and distress. A happier time was enjoyed under Charlotte Amalie, Antony's wife, who ruled as regent for her two sons Charles (1775-1782) and George

(1782-1808), and also under these princes themselves George, who had introduced the principle of immemoriality, was succeeded by his infant son Bernhard Erich Freund, born in 1800. The war with France at the beginning of the present century, with its attendant quartering of troops, conscription, and loans of money, joined with cattle-disease and scanty harvests, in once more plunging the country into distress, from which it but slowly recovered. Bernhard had already spontaneously granted a liberal constitution to his subjects in 1824, when large additions (530 square miles) consequent upon the redistribution of the Saxon lands in 1826 more than doubled his possessions and rendered re-organization necessary. Among the additions to Saxe-Meiningen were the duchy of Hildburghausen (whence the full title of the present duchy is Saxe-Meiningen-Hildburghausen), which had been founded in 1680 by Ernest, the sixth son of Ernest the Pious, the principality of Saalfeld, which, founded by John Ernest, Ernest's seventh son, in 1680, had been united to Coburg in 1785, and the districts of Themar, Kianchfeld, Kamburg, and other smaller territories. Saxe-Meiningen, like the other Saxon duchies, entered the Confederation of the Rhine in 1806, but in 1806, unlike its neighbours, it declared for Austria in the war against Prussia. The land was at once occupied by Prussian troops, and Bernhard abdicated (September 1806) in favour of his son George, who made peace with Prussia and entered the North German Confederation. In 1871 the dispute which had lasted since 1826 between the duke and the diet as to the respective rights of each to the state-lands was terminated by a compromise.

See Plate V
SAXE-WEIMAR-EISENACH (Germ. *Sachsen-Weimar-Eisenach*), the largest of the Thuringian states, is a grand-duchy and a member of the German empire. It consists of the three chief detached districts of Weimar, Eisenach, and Neustadt, and twenty-four scattered exclaves, of which Allstedt, Oldisleben, and Ilmenau belonging to Weimar, and Ostheim belonging to Eisenach, are the chief. The first and last named of these exclaves are 70 miles apart, and the most easterly of the other exclaves is 100 miles from the most westerly. The total area of the grand-duchy is 1387 square miles (or slightly larger than Wiltshire in England), of which 678 are in Weimar, 465 in Eisenach, and 244 in Neustadt.

The district of Weimar, which is at once the largest division and the geographical and historical kernel of the grand-duchy, is a roughly circular territory, situated on the plateau to the north-east of the Thuringian Forest. It is bounded on the N and E by Prussia, on the S and W by the Schwarzburg Obergheirchaft and detached portions of Saxe-Altenburg, and has 23 miles east of the nearest part of Eisenach, and 7 miles north-west of the nearest part of Neustadt. The exclaves of Allstedt and Oldisleben lie in Prussian territory 10 miles to the north and north-west respectively, Ilmenau as far to the south-west. The surface is undulating and destitute of any striking natural features, although the valleys of the Saale and Ilm are picturesque. The Kickelhahn (2835 feet) and the Hohe Tanne (2641 feet) rise in Ilmenau, but the Grosser Kalm (1814) near Remda, in the extreme south, is the highest point in the main part of Weimar. The broad-based Ettersburg (1519 feet), a part of which is known as "Herder's Hill" after the poet, rises on the Ilm plateau, near Ettersburg, where Schiller finished his *Maria Stuart*. The Saale flows through the east of the district, but, although the chief river hydrographically, it yields in fame to its tributary the Ilm. The Unstrut joins the Saale from Oldisleben and Allstedt. The chief towns are Weimar, the capital, on the Ilm, Jena, with the common university of the Thuringian states, on the Saale, and Apolda, the "Manchester of Weimar," to the west.

Eisenach, the second district in size, and the first in point of natural beauty, stretches in a narrow strip from north to south on the extreme western boundary of Thuringia, and includes parts of the church lands of Fulda, of Hesse, and of the former countship of Henneberg. It is bounded on the N. and W. by Prussia, on the S. by Bavaria (which also surrounds the exclave of Ostheim), and on the E. by Saxe-Meiningen and Saxe-Gotha. The

north is occupied by the rounded hills of the Thuringian Forest, while the Rhön Mountains extend into the southern part. The chief summits of the former group, which is more remarkable for its fine forests and picturesque scenery than for its height, are the Warburg Hill (1355 feet), the north-western termination of the system, Ottowald (2103 feet), Wachstein (1801 feet), Ringberg (2106 feet), Hohe Vogelheid (2378 feet), and the Glockner (2211 feet). Among the Rhön Mountains in Eisenach the loftiest summits are the Elbogen (2677 feet), Bayerberg (2359 feet), Hohe Ram (2375), and the Glaserberg (2231 feet). The chief river is the Werra, which flows across the centre of the district from east to west, and then bending suddenly northwards, re-enters from Prussia, and traverses the north-eastern parts in an irregular course. Its chief tributaries in Eisenach are the Hersel and the Ulster. Eisenach is the only town of importance in this division of the grand-duchy.

Neustadt, the third of the larger divisions, is distinguished neither by picturesque scenery nor historical interest. It forms an oblong territory, about 24 miles long by 16 broad, and belongs rather to the hilly district of the Vogtland than to Thuringia. It is bounded on the N. by Reuss (junior line) and Saxe-Altenburg, on the W. by Saxe-Meiningen and a Prussian exclave, on the S. by the two Reuss principalities, and on the E. by the kingdom of Saxony. The Kesselberg (1310 feet) near the town of Neustadt is the chief eminence. This district lies in the basin of the Saale, its chief streams being the White Elster, the Weida, and the Orla. Neustadt, Anna, and Weida are the principal towns.

Agriculture forms the chief occupation of the inhabitants in all parts of the duchy, though in Eisenach and Ilmenau a large proportion of the area is covered with forests. According to the returns for 1888, 56.3 per cent. of the entire surface was occupied by arable land, 25.8 per cent. by pastures, 3.3 by parks and meadow-land, and 4.1 per cent. by buildings, roads, and water. Only 5 per cent. was unproductive soil or moorland. These figures indicate that Saxe-Weimar-Eisenach has nearly as large a percentage of arable land as Saxe-Altenburg, and, notwithstanding the extensive woods in Eisenach and Ilmenau, a lower proportion of forest than any other Thuringian state. In 1888 the chief grain crops were oats (80,662 acres, yielding 88,271 tons), barley (76,067 acres, 48,249 tons), rye (72,807 acres, 26,006 tons), and wheat (47,782 acres, 19,949 tons). About 50,000 acres were planted with potatoes, yielding 287,627 tons, or nearly 4 per cent. per acre less than the average of the five years immediately preceding. All the grain crops were slightly above the average of the same period. The 79,405 acres devoted to hay produced 89,910 tons. Among the other crops were beetroot for sugar (8602 acres), flax (1800 acres), and oil-yielding plants (4699 acres). Fruit grows in abundance, especially in the neighbourhood of Jena, in the valley of the Gleisse, and on the lower Ilm, 1070 acres, mostly on the banks of the Saale, were occupied with vines. Of the forests 88.5 per cent. are deciduous and 11.5 per cent. coniferous trees, fully a half of the former are beeches. The greater part of the forests belong to the Government. Cattle-raising is carried on to a considerable extent, especially in Eisenach and Neustadt, while the sheep-farming centres in Weimar. The grand-duchy contains the dairy. It maintains the breed of horses. In 1888 the duchy contained 17,271 horses, 110,092 cattle, 145,442 sheep, 101,448 pigs, and 41,291 goats. Although iron, copper, cobalt, and lignite are worked, the mineral wealth is trifling. Salt is also worked at different places.

The manufacturing industries in the grand-duchy are considerable, they employ 37.3 per cent. of the population. The most important is the textile industry. Ground-ceilings in gold, and employs more than 20,000 hands throughout the empire. The production of woollen goods (stockings, cloth, underwear) forms the leading branch of the industry, but cotton and linen weaving and yarn-spinning are also carried on. Large quantities of earthenware and crockery are made, especially at Ilmenau. The microscopes of Jena, the scientific instruments (thermometers, barometers, &c.) of Ilmenau, and the pipes and organ-bellows of Bacha (partly in Gotha) are well known. Leather, paper, glass, cork, and tobacco are among the less prominent manufactures. There are numerous breweries in the duchy. The volume of trade is not very great, although some of the productions (chiefly those first mentioned) are exported all over Europe, and in some cases to other continents as well. The chief imports, besides

coloured goods, are wool for the manufacturers, hides, coal, met-scham (from Smyrna and Vienna), amber, horn, &c. Eisenach and Weimar are the chief seats of trade.

The population in 1880 was 309,577, or 223 per square mile, of whom 297,736 were Lutherans, 10,597 Roman Catholics, 327 Christians of other sects, and 1,848 Jews. The Thuringian and Franconian branches of the Teutonic family are both represented in the duchy. According to the employment census of 1852, agriculture, forestry, and fishing supported 135,200 or 44 per cent of the population, industrial pursuits, 114,836 or 37 per cent, trade, 23,939 or 7 per cent, service, 4056 or 1 per cent, official, military, and professional employments, 16,060 or 5 per cent, while 15,494 persons, or 4 per cent, were unemployed.

Saxe-Weimar-Eisenach is a limited hereditary monarchy, and was the first state in Germany to receive a liberal constitution. This was granted in 1816 by Charles Augustus, the patron of Goethe, and was revised in 1850. The diet consists of one chamber with thirty-one members, of whom one is chosen by the nobility, four by owners of land worth at least £160 a year, five by those who derive as much from other sources, and twenty-one by the rest of the inhabitants. The diet meets every three years, and the deputies are elected for six years. The franchise is enjoyed by all domiciled citizens over twenty-five years of age. The government is carried on by a ministry of three, holding the portfolios of finance, of home and foreign affairs, and of religion, education, and justice, with which is combined the dual household. The budget for the finance-period 1884-85 estimated the yearly income at £308,556 and the yearly expenditure at £260,000, leaving a surplus of £48,556, more than covered by the active capital. The dual house receives a civil list of £46,500. The Saxe-Weimar family is the oldest branch of the Ernestine line, and hence of the whole Saxon house. By treaties of succession the grand-duke is the next heir to the throne of Saxony, should the present Albertine line become extinct. He is entitled to the predicate of "royal highness." By a treaty with Prussia in 1867, which afterwards became the model for similar treaties between Prussia and other Thuringian states, the troops of the grand-duchy were incorporated with the Prussian army.

In early times Weimar, with the surrounding district, belonged to the counts of Orlamünde, and from the end of the 10th century until 1087 it was the seat of a line of counts of its own. It afterwards fell to the judgment of Thuringia, and in 1440 passed into the possession of Ernest the Mild, count of Saxony. Involved after the extinction of Wittenberg (1527) in the complicated and constantly shifting succession arrangements of the Ernestine dukes of Saxony, who delayed the introduction of primogeniture, Weimar does not emerge into an independent historical position until 1640, when the brothers William, Albert, and Ernest the Pious founded the principality of Weimar, Eisenach, and Gotha. Eisenach fell to Weimar in 1644, and, although the principality of Weimar was more temporarily united to the Jülich-Saxe-Weimar, Saxe-Eisenach (1672-1741), and Saxe-Jena (1672-1690), it was again reunited under Ernest Augustus (1728-1748), who secured it against future subdivision by adopting the principle of primogeniture. His son of the same name who succeeded died in 1758, two years after his marriage with Anna Amalia of Brunswick. Next year the duchess Amalia, although not yet twenty years old, was appointed by the emperor regent of the principality and guardian of her infant son Charles Augustus (1758-1788). The reign of the latter, who assumed the government in 1775, is the most brilliant epoch in the history of Saxe-Weimar. A gifted and intelligent patron of literature and art, Charles Augustus attracted to his court the leading authors and scholars of Germany. Goethe, Schiller, and Herder were members of the illustrious society of the capital, and the university of Jena became a focus of light and learning, so that the hitherto obscure little state attracted the eyes of all Europe. The war with France was fraught with danger to the continued existence of the principality, and after the battle of Jena (October 14, 1806) it was mainly the skilful management of the duchess Louise that dissuaded Napoleon from removing her husband from among the reigning princes. In 1807 Saxe-Weimar-Eisenach entered the Confederation of the Rhine, and was promoted from a principality (Fürstenthum) to a duchy (Herzogthum). In the following campaign it suffered greatly; and in 1815 the congress of Vienna recompensed its ruler with an addition to his territory of 660 square miles (including most of Neustadt) with 77,000 inhabitants, and with the title of grand-duke (Grossherzog). On the restoration of peace Charles Augustus redeemed his promise of granting a liberal constitution (1816). Freedom of the press was also granted, but after the festival of the Wartburg in 1818 it was seriously curtailed. Charles Frederick (1828-1853) continued his father's policy, but his reforms

were neither thorough enough nor rapid enough to avert political commotion in 1848. A popular ministry received power, and numerous reforms were carried through. Reaction set in under Charles Alexander, who succeeded his father in 1853, and the union of the state-lands and crown-lands was repealed, though both were appended to remain under the same public management. In 1866 the grand-duchy joined Prussia against Austria, although its troops were then garrisoning towns in the Austrian interest, later it entered the North German Confederation. The press restrictions were removed in 1868 and the tendency of recent legislation has been liberal. (F. MU.)

SAXIFRAGE (*Saxifraga*), a genus of plants which gives its name to the order of which it is a member. There are nearly 200 species distributed in the temperate and arctic parts of the northern hemisphere, frequently at considerable heights on the mountains. They are mostly herbs with perennial rootstocks, leaves in tufts, or, on the flower-stalks, scattered. The arrangement of the flowers is very various, as also are the size and colour of the flowers themselves. They have a calyx with a short tube, five petals, ten (or rarely five) stamens springing, like the petals, from the edge of the tube of the calyx. The pistil is partly adherent to the calyx-tube, and is divided above into two styles. The ovules are numerous, attached to axile placentas. The seed-vessel is capsular. Many species are natives of Britain, some alpine plants of great beauty (*S. oppositifolia*, *S. nivalis*, *S. aizoides*, &c.), and others, like *S. granulata*, frequenting meadows and low ground, while *S. tridactylites* may be found on almost any dry wall. Many species are in cultivation, including the *Baigenias* or *Megaseas* with their large fleshy leaves and copious panicles of rosy or pink flowers, the numerous alpine species, such as *S. pyramidalis*, *S. Cotyledon*, &c., with tall panicles studded with white flowers, and many others.

SAXO GRAMMATICUS, the celebrated Danish historian and poet, belonged to a family of warriors, his father and grandfather having served under king Valdemar I (d 1182). He himself was brought up for the clerical profession, entered about 1180 the service of Archbishop Absalon as one of his secretaries, and remained with him in that capacity until the death of Absalon in 1201. At the instigation of the latter he began, about 1185, to write the history of the Danish Christian kings from the time of Sven Estridson, but later Absalon prevailed on him to write also the history of the earlier, heathen times, and to combine both into a great work, *Gesta Danorum*. The archbishop died before the work was finished, and therefore the preface, written about 1203, is dedicated to his successor Archbishop Andreas, and to King Valdemar II. Nothing else is known about Saxo's life and person, a chronicle of 1265 calls him "miræ et urbanæ eloquentiæ clericus," and an epitome of his work from about 1340 describes him as "egregius grammaticus, origine Sialandus," that he was a native of Zealand is probably correct, inasmuch as, whereas he often criticizes the Jutlanders and the Scamians, he frequently praises the Zealanders. The surname of "Grammaticus" is probably of later origin, scarcely earlier than 1500, apparently owing to a mistake. The title of "provost (dean) of Roskilde," given him in the 16th century, is also probably incorrect, the historian being confounded with an older contemporary, the provost of the same name Saxo, from his apprenticeship as the archbishop's secretary, had acquired a brilliant but somewhat euphuistic Latin style, and wrote fine Latin verses, but otherwise does not seem to have had any very great learning or extensive reading. His models of style were Valerius Maximus, Justin, and Martians Capella, especially the last. Occasionally he mentions Bede, Dudo, and Paulus Diaconus, but does not seem to have studied them or any other historical works thoroughly, and he neither understands nor is interested in scientific research, in general history, or even in chronology. He wrote because he

¹ An article on Saxe-Weimar-Eisenach would hardly be complete without Goethe's famous lines —

"Kien ist uns unter den Fürsten Germaniens nicht der weisse,
Kunz und schone Land, müssig nur was er vermag,
Aber so wende noch nicht, so wende auch nicht die Kiste
Jeden, da war ein Feind Deutsches mit Deutschen zu sein."

did not like his countrymen to be behind other nations through the want of an historian, and because he wished to perpetuate the record of the exploits of the Danes. His sources are partly Danish traditions and old songs, partly the statements of Archbishop Absalon, partly the accounts of Icelanders, and, lastly, some few earlier, but scanty, sources, being lists of Danish kings and short chronicles, which furnished him with some reliable chronological dates. He considered traditions as history, and therefore made it his chief business to recount and arrange these, by the help of the lists of the kings, into a connected whole. His work, therefore, is a loosely connected series of biographies of Danish kings and heroes, he dwells with predilection on those periods during which Danish kings were said to have made great conquests, and he represents these conquerors as the paragons of their times.

The first nine books comprise "Antiquity," that is, traditions of kings and heroes of the half-mythical time up to about 950. Here we have traditions about Fiefred, about Amleth (Hamlet) and Fenge, about Rolf Kake, Hadding, the giant Starkathei, Harald Hildetann, and Ragnar Lodbrok. In this earlier history Saxo has also embodied myths of national gods who in tradition had become Danish kings, for instance, Baldi and Hother, and of foreign heroes, likewise incorporated in Danish history, as the Gothic Jarnmarr (S. E. Erengrus), the Anglian Vernumund (A. S. Garmund) and Uffe (A. S. Ofte), the German Hadu and Hild, &c. Frequently the narrative is interrupted by translations of poems, which Saxo has used as authentic sources, although they are often only a few generations older than himself. In the later books (x-xvi) of his work he follows to a greater extent historical accounts, and the more he approaches his own time the fuller and the more trustworthy his relation becomes, especially brilliant is his treatment of the history of King Valdemar and of Absalon. But his patriotism often makes him partial to his countrymen, and his want of critical sense often blinds him to the historical truth.

Saxo's work was widely read during the Middle Ages, and several extracts of it were made for smaller chronicles. It was published for the first time, from a MS afterwards lost, in Paris, 1514, by the Danish humanist Christen Pedersen, this edition was reprinted at Basel, 1584, and at Frankfurt, 1576. Older editions may be mentioned that of Stephen Steinhans, Saxo, 1544, that of C. A. Klotz, Leipzig, 1771, and that of P. E. Müller and J. M. Velschow, Copenhagen, 1839. No complete MS any longer exists, yet a few small fragments have been found of three MSS. The most remarkable of these is the fragment found at Angers, in France, written shortly after 1200, perhaps by Saxo himself or under his superintendence, here several corrections are found above the lines, showing how the author varied and polished his Latin style.

SAXON DUCHIES. For the four Saxon duchies, **SAXE-ALZENBURG**, **SAXE-COBURG-GOTHA**, **SAXE-MEININGEN**, and **SAXE-WEIMAR-EISENACH**, see those headings.

SAXONS, LAW OF THE. See **SALIC LAW**.

Plate V

SAXONY is the name successively given in German history to a mediæval duchy in northern Germany, to a later electorate which afterwards became the present kingdom of Saxony (described below), and to a ducal province of Prussia. The last was formed directly out of part of the second in 1815, but the connexion between the first and second, as will be seen from the present article, is neither local nor ethnographical but political.

The Saxons (*Lat. Saxonæ*, *Ger. Sachsen*), a tribe of the Teutonic stock, are first mentioned by Ptolemy as occupying the southern part of the Cimbric peninsula between the Elbe, Eider, and Trave, the district now known as Holstein. The name is most commonly derived from "saks," a short knife, though some authorities explain it as meaning "settled," in contrast to the Suevi or "wandering" people. By the end of the 3d century, when we hear of a "Saxon Confederation" embracing the Cherusci, Chauci, and Angriarii, and perhaps corresponding to the group of tribes called Ingevenes by Tacitus, the chief seat of the nation had been transferred south of the Elbe to the lands on both sides of the Weser now occupied by Oldenburg and Hanover. The Saxons were one of the most warlike and adventurous of the Teutonic peoples,

and they not only steadily extended the borders of their home, but made colonizing and practical excursions by sea far and wide. In 257 they assisted the Menapii Carausius to make himself master of Romanized Britain, where he assumed the title of Augustus, and on the Continent they came into collision with the Roman empire under both Julian and Valentinian, the latter of whom defeated them in 373 so far south as Deutz, opposite Cologne. Their settlements along the coast of Flanders extended to the mouth of the Loire, and, though these were soon absorbed by the Franks, their expeditions to England finally resulted in the foundation of lasting kingdoms (Essex, Sussex, Wessex) (see **ENGLAND**, vol. viii pp. 268 sq.)¹ About the beginning of the 5th century part of the Flemish coast became known as the *Latius Saxorum*, from the settlements of this people. The Saxons who remained in Germany (Alt-Sachsen or Old Saxons) gradually pushed their borders further and further until they approached the Rhine, and touched the Elbe, the North Sea, and the Harz Mountains. In 531 they joined their neighbours the Franks in a successful expedition against the Thuringians, and received as their spoil the conquered territory between the Harz and the Unstrut. Their settlements here were, however, forced to acknowledge the supremacy of the Franks, and from this period may be dated the beginning of the long strife between these two peoples which finally resulted in the subjugation of the Saxons. During the reigns of the weak Merovingian kings who succeeded Lothar I on the Frankish throne, the Saxons pushed into northern Thuringia, afterwards known as the Alt-Mark. Pippin the Short obtained a temporary advantage over them in 753 and imposed a tribute of three hundred horses, but their final conquest was reserved for Charlemagne. At this time the Saxons did not form a single state under one ruler, but were divided into the four districts of Westphalia to the west of the Weser, Eastphalia chiefly to the east of that river, Engern or Angria along both banks, and Nordalbingia in Holstein. The gaus were independent, each having an ealdorman of its own, and they only combined in time of war or other emergency to choose a herzog, or common leader. The people were divided into the "frilinge" or "frone," who possessed the land, the "liti" or "lazzi," a semi-free class, and the serfs, who had no rights. The "edilinge" were the chiefs, but had no political advantages over the "frilinge." Their religion was a simple type of northern heathenism. See **GERMANY**, vol. x pp. 473 and 477 sq.

In 772 Charlemagne, induced partly by a desire to protect his kingdom from the incursions of hostile neighbours and partly by a proselytizing spirit, began the subjugation of the Saxons. The war, waged on both sides with the utmost ferocity, lasted in a series of campaigns with but brief intervals for thirty-one years. Repeatedly conquered and baptized, the Saxons rose again and again in revolt as soon as Charlemagne withdrew his troops, threw off their forced allegiance to Christianity, and under various leaders, of whom Wittekind or Widukind is the most famous, struggled fiercely to regain their independence. Charlemagne was too strong and his measures too relentless. On one occasion he butchered 4500 captives in cold blood, as a revenge and a warning. Wittekind surrendered and was baptized in 785, and after what is called the Second Saxon War, which broke out in 792, resistance died away about 803. The Saxons were allowed

¹ Though the Saxons were not the first to effect the foundation of a Teutonic kingdom in England, they were the first to attempt it, and hence their name was applied (as it still is) by the Celtic inhabitants of the British islands to all Teutonic settlers. A similar general use of the name survives in Transylvania, where the German inhabitants are called "Saxons," although only a small proportion of them trace their descent from the Saxon branch of the Teutonic family.

a considerable amount of freedom by their sagacious conqueror. The first *Capitulare Saxonum*, issued at Paderborn in 788, while very strict in maintaining Christianity and in punishing all rebellion, confirmed a great number of Saxon customs and laws. After 803 the laws were made milder, and no tribute except tithes was demanded. The people lived according to their former laws,¹ under grafts appointed by Charlemagne, various bishoprics were founded, of which Osnabrück (783), Verden (786), and Bremen (787) are the earliest, and tranquillity was still further secured by transplanting colonies of Saxons to other parts of the kingdom, and introducing Frankish colonies to take their place in Saxony. The land now gradually became an integral portion of the kingdom of the Franks.² Under Louis the German, to whom Saxony had fallen at the treaty of Verdun in 843, it was harassed by the incursions of the Normans and Slavs on either side, and, in order to cope with these, herzogs or dukes were appointed about 850 to keep the Saxon Mark, a narrow territory in Nordalbingia, on the west bank of the Elbe. These herzogs, remembering their predecessors or their ancestors (Ludolf, the first duke of Saxony, is said to have been a descendant of Wittekind), rapidly extended their power beyond the mark over the rest of Saxony, and thus founded the powerful duchy of Saxony. Otto the Illustrious, who succeeded his brother Bruno as duke in 880, added Thuringia to the duchy, and attained such a pitch of power that he was offered the crown of Germany in 911. He refused the honour on the score of old age, but his son Henry the Fowler accepted it in 919, and founded the line of Saxon emperors which expired with Henry II the Pious in 1024. Otto the Great, son of Henry I, bestowed the duchy of Saxony upon Hermann Billung or Billung, in whose family it remained till 1106. The power and influence of Saxony during this period depended partly on the favour of the emperors, but chiefly on the sagacity and energy of the successive dukes. The Saxons were hostile to the Franconian emperors who succeeded the Saxon house, and in 1073 they rose in revolt against Henry IV. They were at first successful, but in 1075, at the battle of Langensalza, they were defeated by the emperor. The rebels were severely punished, though Otto of Nordheim, one of their leaders, was made administrator of the duchy. Taking advantage of Henry IV's troubles with the pope, they again rebelled and espoused the cause of Rudolf of Swabia, but in 1087, on the resignation of Hermann of Luxemburg, whom they had chosen king, they made peace once more with the emperor. Magnus was the last duke of the Billung line. The emperor Henry V now (1106) presented the lapsed duchy to Lothar, count of Supplinburg, who rapidly became the most powerful prince in Germany, and in 1125 was placed on the imperial throne by the influence of the papal party. Two years after his elevation he assigned the duchy of Saxony to his powerful son-in-law Henry the Proud, who was already duke of Bavaria and had inherited the private possessions of the Billungs in Saxony, in right of his mother, who was a daughter of Magnus. Henry had aspired to be emperor in 1138, and his successful rival Conrad III, wishing to reduce his power, alleged that it was unlawful for one prince to hold two duchies, and ordered him to resign Saxony. On his refusal, the emperor immediately declared both duchies to be forfeited. Henry died before the ensuing war was ended, and Conrad compromised

matters by appointing his opponent's young son, afterwards known as Henry the Lion, to the duchy of Saxony, compensating Albert the Bear, the former imperial candidate, with the independence of the North Mark of Saxony, afterwards called Brandenburg (see PRUSSIA, vol. xx p. 2). In 1155 Henry received Bavaria from his cousin and personal friend the emperor Frederick Barbarossa, and thus became second only to the emperor in power. He added considerably to the extent of Saxony by conquest among the Wends, east of the Elbe, where the boundary had always been a fluctuating one. But Henry was not only powerful, he was also arrogant, and incurred the jealousy of the other princes, so that, when he quarrelled with the emperor and his lands were declared forfeited in 1180, he had no allies to assist him in his resistance. Westphalia, the principal part of Saxony, went to the archbishop of Cologne, the Saxon Palatinate to the landgrave of Thuringia, and other portions to other princes. A small district round Lauenburg, north of the Elbe, was assigned with the title of duke of Saxony to Bernhard of Ascania, son of Albert the Bear. Henry was reduced to submission in 1181, but his duchies could not be restored, and he was forced to content himself with Brunswick and Lüneburg. The duchy of Saxony was never restored in the old sense, in which it had been one of the four principal duchies of the empire, and embraced the territories now occupied by Westphalia, Oldenburg, Hanover, the Harz, and parts of Mecklenburg and Holstein. The new creation never rose to any importance. Bernhard of Ascania (1181-1212), before his accession as duke of Saxony, had held Anhalt and Wittenberg, to the south-east of Saxony, and separated from it by the Mark of Brandenburg, and when his grandsons John and Albert II divided their inheritance in 1260 the latter placed his seat at Wittenberg, and two tiny duchies arose—Saxe-Lauenburg and Saxe-Wittenberg. Saxe-Lauenburg was now the only part of the great duchy which retained the name, while Saxe-Wittenberg, the nucleus of the later electorate, transferred the name to entirely new soil. Both duchies claimed the electoral privileges, including the office of grand marshal (Erzmarschall), which had belonged to the original duke of Saxony, but the Golden Bull of 1356 confirmed the claims of Wittenberg. Rudolf II (about 1370) is the first duke who formally styles himself elector (*princeps elector*). The small electorate was made still smaller in 1411 by the formation of Anhalt into a separate principality. In 1422 the Ascanian line became extinct with Albert III, and in 1423 the emperor Sigismund conferred their lands and titles upon Frederick, margrave of Meissen, and landgrave of Thuringia, to whom he was deeply indebted both for money and assistance in the Hussite wars. The new and more honourable style of elector of Saxony superseded Frederick's other titles, and the term Saxony gradually spread over all his other possessions, which included the country now known under that name. The early history of the electorate and kingdom of Saxony is thus the early history of the Mark of Meissen, the name of which now lingers only in a solitary town on the Elbe.³

¹ A different and considerably later use of the name Saxony may be conveniently mentioned here, for, though not based upon any political or ethnographical considerations, it is frequently referred to in German history. When Maximilian (1493-1550) formed the ten great imperial administrative circles, that part of the empire to the east of the Weser and north of the Erzgebirge was divided between the circles of Lower and Upper Saxony. The former, occupying the north-west of this territory, included the Harz principalities, Magdeburg, Brunswick, Mecklenburg, Bremen, and Holstein; the latter, besides Thuringia, the electorate of Saxony and Brandenburg, embraced the conquered Slavonic lands to the east and north, including Livonia and Pomerania. The lands which still preserve the name of Saxony are thus all within the limits of these circles.

² The *Lex Saxonum*, 19 titles of which have survived, was reduced to writing under Charlemagne. See under SAXONY LAW.

³ The *Adriana* (Saxony), a religious poem ascribed to an unknown Saxon poet of the 9th century, is often cited as a proof of the rapid Christianization of the Saxons. It is also almost the only relic of their dialect.

Among the mountains of Lusatia, in the south of the Saxon province of Bautzen, there exist to this day about 50,000 Wends, possessing characteristics and speaking a language of their own. These curious people are the relics of a vast Slavonic horde which, appearing on the borders of the Saxon kingdom of Meissen and Thuringians about the 4th century, pressed into their territories on the downfall of that kingdom in the 6th century, and settled themselves between the Spree and the Saale. They were known as the Sorbs or Sorabi, and the country, which included the whole of the modern kingdom of Saxony, was called Sorabia. Warlike and persistent, their influence has never been obliterated, and, though conquered, their spirit has never been completely absorbed. They were skilled in agriculture and cattle-breeding, and soon improved the fertile soil of their new settlements. Some writers are disposed to recognize their influence in the strong bent to agricultural and industrial pursuits which has ever since characterized the inhabitants of this part of Germany, and less doubtful traces have been left in the popular superstitions and legends, and in the local names. For more than a hundred years after their first collision with the German kingdom the Sorbs repulsed all attacks, but in 928 Henry the Fowler, the first Saxon emperor, crossing the Elbe, devastated the land of the Daleminians, and built the strong castle of Misma or Meissen, which thenceforward formed the centre of a gradually increasing mark against the heathen. For two hundred years the office of margrave of Meissen was not hereditary, but in 1238 Count Conrad of Wettin obtained the succession for his house, and founded a line of princes, whose descendants still occupy the throne. It is said, though on very doubtful grounds, that Conrad was a scion of the family of the old Saxon hero Wittekind. In 1156, when Conrad abdicated and set the pernicious example of dividing his lands among his sons, his possessions extended from the Neisse and the Elbe to the Harz and the Saale. During these two centuries the state of the country had but slowly improved. The Sorbs had been reduced to a condition of miserable serfdom, and the best land was in the hands of Slavish peasants who had been attracted by its fertility. Agriculture was encouraged by the ecclesiastics, especially by Bishop Benno, who occupied the see of Meissen (founded in 961) about the time of the conquest of England by the Normans. In the reign of Otto the Rich (1157-1190) the first silver mines were discovered, and the famous mining laws of Saxony were framed. Trade also received its first encouragement, the great fairs of Leipzig were protected, and roads were made and towns fortified with the produce of the mines. Otto's grandson, Henry the Illustrious (1221-1288), whose mother Jutta was a Thuringian princess, reunited most of Conrad's lands by inheriting part of Thuringia (the rest went to the duke of Brabant) and the Pleissland, as the district on both banks of the upper course of the Pleisse was called. He took the chance of founding a magnificent kingdom in the heart of Germany, by subdividing his territories, which stretched in a compact mass from the Werra to the Oder and from the mountains of Bohemia to the Harz. The consequences of this policy of subdivision, which was followed by his successors, were bitter family feuds and petty wars, seriously hampering the development of the country. Frederick the Great (1244-1247) was the last prince of the house of Wettin who was sole ruler of all the ancestral lands of his house. The next powerful figure is Frederick the Warlike, who became margrave in 1281. Besides the Mark he possessed the Osterland, the territory to the north-west of the present kingdom, stretching from the Saale at Weissenfels to the Elbe at Torgau, and embracing the plain of Leipzig. Frederick, in whose reign the university of Leipzig was founded, had acquired his surname by his energetic support of Sigismund, especially in the Hussite wars. As we have seen, that emperor's desire to attach to himself so powerful an ally led him to bestow the vacant electoral duchy of Saxe-Wittenberg upon the margrave in 1423. Despite the troublous state of public affairs, the internal prosperity of the land had steadily advanced. Most of the chief towns had by this time been founded,—Leipzig, Erfurt, Zwickau, and Freiberg being the most conspicuous. Chemnitz had begun its textile industry. The condition of the peasants was still far below that of the burghers of the towns, many of them were mere serfs. The church retained the high pitch of power which it had early attained in Meissen, and religious institutions were numerous all over the most fertile districts. In spite of fresh discoveries of silver, the pecuniary wants of the princes had to be occasionally supplied by contributions called "bedes" from the nobles and ecclesiastics, who were summoned from time to time to meet in a kind of diet.

Frederick's new dignities as elector, combined with his personal qualities, now made him one of the most powerful princes in Germany, had the principle of primogeniture been established in the country as he left it, Saxony and not Brandenburg might have been the leading power in the empire to-day. He died in 1428, just in time to escape the grief of seeing his lands cruelly ravaged by

the Hussites in 1429 and 1430. The division of territory between his two sons, Frederick the Mild (1428-1464) and William, once more called forth destructive internecine wars (the "Büderkrieg"), in which the former for a time forgot his surname. It was in 1455, during this war, that the knight Kunz von Kautungen carried into execution his bold, though only momentarily successful, plan of stealing the two young sons of the elector Frederick Ernest and Albert, the two princes in question, succeeded to their father's possessions in 1464, and for twenty years ruled peacefully in common. The land rapidly prospered during this respite from war. Trade made great advances, encouraged by an improved coinage, which was one of the consequences of the silver discoveries on the Schneeberg. Several of the powerful ecclesiastical principalities were at this time held by members of the Saxon electoral house, so that the external influence of the electorate corresponded to its internal prosperity. Matters were not suffered to continue thus. The childless death of their uncle William in 1482 bequeathed Thuringia to the two princes, and the younger Albert insisted upon a division of the common possessions. In August 1485 the Partition of Leipzig took place, which resulted in the foundation of two Saxon lines, the Ernestine and the Albertine. The lands were never again united. Ernest divided the lands into two portions, and Albert chose apart from the electoral duchy of Wittenberg, which necessarily went to Ernest as the elder brother, the lands were divided into Thuringia, half of the Osterland, and Naumburg and the Voigtland on the one hand, and Meissen and the remaining parts of eastern Saxony on the other. To Ernest's deep chagrin, Albert chose Meissen, the old ancestral lands of the Wettins. The former only survived his vexation a year.

The electorate remained at first with the Ernestine line. Ernest was succeeded by his son Frederick the Wise (1486-1525), one of the most illustrious princes in German history. Under his rule Saxony was perhaps the most influential member of the German empire, and on the death of Maximilian the imperial crown itself was offered to him, but he vindicated his character by refusing it. In this reign Saxony became the cradle of the Reformation. The elector's wise tolerance and subsequent protection and hearty support of Luther are well known to every reader. He is said to have remained unmarried out of love to his brother John, who succeeded him. He died during the horrors of the Peasants' War. John (1525-1532) was an even more enthusiastic favourer of the Reformed doctrines, and shared the leadership of the Schmalkald League with Philip of Hesse. His son, John Frederick the Magnanimous (1532-1547), might with equal propriety have been surnamed the Unfortunate. He took part in the Schmalkald War, but in 1547 was captured at Mühlberg by the emperor Charles V., and forced to sign the capitulation of Wittenberg. This deed transferred the electorate and nearly all the Saxon lands to the Albertine line, whose astute representative had taken the imperial side. Only a few scattered territories in Thuringia were reserved for John Frederick's sons, and on these were afterwards founded the Ernestine duchies of Weimar, Gotha, &c. For the second time in the history of the Saxon electorate, the younger line on a division ultimately secured the highest dignity, for the Wittenberg line had been junior to the Lanenberg line. The Albertine line is now the royal line of Saxony.

The Albertine Maurice became elector after the capitulation of Wittenberg. He was the grandson of the founder of his house, and had been preceded on the throne of Meissen by his uncle George (1500-1559) and by his father Henry (1539-1541). George was a zealous Roman Catholic, and had vainly endeavoured to stem the Reformation in

his dominions, Henry was an equally devoted Protestant Maurice (1541-1553) was also a Protestant, but he was too astute to permit his religion to blind him to his political interests. His ruling motive seems to have been ambition to increase his personal power and the consequence of his country. He refused to join the Schmalkald League with the other Protestant princes, and made a secret treaty with the emperor instead. By invading the Ernestine lands in John Frederick's absence during the Schmalkald War, he forced that prince to return hastily from the Danube, and thus weakened the army opposed to the emperor. Though he was compelled to retreat before his indignant and surprised kinsman, his fidelity to the emperor was rewarded, as we have seen, at the capitulation of Wittenberg. All the lands torn from the Ernestines were not, however, assigned to Maurice, he was forced to acknowledge the suzerainty of Bohemia over the Voigtland and the Silesian duchy of Sagan, and to renounce his own superiority over the Reuss dominions. The Roman Catholic prelates were moreover reinstated in the three great bishoprics of Meissen, Merseburg, and Naumburg-Zeitz. Recognizing as a Protestant sovereign that the best alliance for securing his new possessions was not with the Roman Catholic emperor but with the other Protestant princes, Maurice now began to withdraw from the former and to conciliate the latter. In 1552, suddenly marching against the emperor at Innsbruck, he extorted from him the peace of Passau, which accorded religious freedom throughout Germany. Thus, at the close of his life (he died of a wound in battle in 1553), Maurice came to be regarded as the champion of German national and religious freedom. Amid the distractions of outward affairs, Maurice had not neglected the internal interests of Saxony. To the already conspicuous educational advantages in the country he added the three grammar schools (Fürstenschulen) at Pforta, Grimma, and Meissen, and for administrative purposes, especially for the collection of the taxes which had now become practically annual, he divided the country into the four "circles" of the Electorate, Thuringia, Leipzig, and Meissen. In 1542 the first coal mine was opened. Over two hundred convents were suppressed in Saxony, Leipzig, Wittenberg, Jena, and Erfurt had each a university, books began to increase, and the Saxon dialect became the ruling dialect of German in virtue of Luther's translation of the Bible. Augustus I (1553-1586), brother of Maurice, was one of the best domestic rulers that Saxony ever had. He increased the area of the country by the "circles" of Neustadt and the Voigtland, and by parts of Henneberg and the silver-yielding Mansfeld, and he devoted his long reign to the development of its resources. He visited all parts of the country himself, and personally encouraged agriculture, he introduced a more economical mode of mining and smelting silver, he favoured the importation of finer breeds of sheep and cattle, and he brought foreign weavers from abroad to teach the Saxons. Under him lace-making began on the Erzgebirge, and cloth-making flourished at Zwickau. He was the first to fortify the Königstein, the one fortress in modern Saxony, and he built other castles. With all his virtues, however, Augustus was an intolerant Lutheran, and used very severe means to exterminate the Calvinists, in his electorate he is said to have expelled one hundred and eleven Calvinist preachers in a single month. Under his son Christian I (1586-1591) the chief power was wielded by the chancellor Crell, who strongly favoured Calvinism, but, when Christian II (1591-1611) came to the throne a mere child, Crell was sacrificed to the Lutheran nobles. The duke of Weimar was made regent, and continued the persecution of crypto-Calvinism, in spite of the breach with

the Reformed imperial diet which this course involved Christian II was succeeded by his brother John George I (1611-1636), under whom the country was devastated by the Thirty Years' War. John George was an amiable but weak prince, totally unfitted to direct the fortunes of a nation in time of danger. He refused the proffered crown of Bohemia, and when the Bohemian Protestants elected a Calvinist prince, he assisted the emperor against them with men and money. The Restitution Edict, however, in 1629, opened his eyes to the emperor's projects, and he joined Gustavus Adolphus. Saxony now became the theatre of war. The first battle on Saxon soil was fought in 1631 at Breitenfeld, where the bravery of the Swedes made up for the flight of the Saxons. Wallenstein entered Saxony in 1632, and his lieutenants Holk and Gallas plundered, burned, and murdered through the length and breadth of the land. After the death of Gustavus Adolphus at the battle of Lutzen, not far from Leipzig, in 1632, the elector, who was at heart an imperialist, detached himself from the Swedish alliance, and in 1635 concluded the peace of Prague with the emperor. By this peace he was confirmed in the possession of Upper and Lower Lusatia, a district of 180 square miles and half a million inhabitants, which had already been pledged to him as a reward for his services against the Bohemians. Lusatia had once belonged to Conrad of Meissen, whose descendants, however, had lost it to Brandenburg at the beginning of the 14th century. Saxony had now to suffer from the Swedes a repetition of the devastations of Wallenstein. No other country in Germany was so terribly scourged by this terrible war. Immense tracts were rendered absolutely desolate, and whole villages vanished from the map, the people were tortured to reveal their treasures, or from wanton brutality, famine was followed by plague, civilization was thrown back and barbarism revived. In eight years the population sank from three to one and a half millions. When the war was at length ended by the peace of Westphalia in 1648, Saxony found that its influence had begun to decline in Germany. Its alliance with the Catholic party deprived it of its place at the head of the Protestant German states, which was now taken by Brandenburg. John George's will made the decline of the electorate even more inevitable by detaching from it the three subsidiary duchies of Saxe-Weissenfels, Saxe-Merseburg, and Saxe-Zeitz in favour of his younger sons. By 1746, however, these lines were all extinct, and their possessions had returned to the main line. Saxe-Neustadt was a short-lived branch from Saxe-Zeitz, extinct in 1714. The next three electors, who each bore the name of John George, had uneventful reigns. The first made some efforts to heal the wounds of his country; the second wasted the lives of his people in foreign wars against the Turks, and the third was the last Protestant elector of Saxony. John George IV. was succeeded by his brother Frederick Augustus I., or Augustus the Strong (1694-1733). This prince was elected king of Poland as Augustus II. in 1697, but any weight which the royal title might have given him in the empire was more than counterbalanced by the fact that he, though the ruler of an almost exclusively Protestant electorate, became a Roman Catholic in order to qualify for the new dignity. The connexion with Poland was disastrous for Saxony. In order to defray the expenses of his wars with Charles XII., which resulted from his Polish policy, Augustus pawned and sold large districts of Saxon territory, while he drained the electorate of both men and money. For a year before the peace of Altranstadt in 1706, when Augustus gave up the crown of Poland, Saxony was occupied by a Swedish army, which had to be supported at an expense of twenty-

three million thalers. The wars and extravagance of the elector-king, who regained the Polish crown in 1709, are said to have cost Saxony a hundred million thalers. From this reign dates the privy council (*Geheimes Kabinett*), which lasted till 1830. The estate privileges of the estates (*Stände*) were increased by Augustus, a fact which tended to alienate them more from the people, and so to decrease their power. Böttger made his famous discovery in 1710, and the manufacture of porcelain was begun at Meissen, and in this reign the Moravian Dietheims made their settlement at Herrnhut (1722). Frederick Augustus II (1733-1763), who succeeded his father in the electorate, and was afterwards elected to the throne of Poland as Augustus III, was an indolent prince, wholly under the influence of Graf von Brühl. Brühl was an incompetent statesman and an extravagant financier, who yet contrived to amass large sums for his private purse. Under his ill-omened auspices Saxony sided with Prussia in the First Silesian War, and with Austria in the other two. It gained nothing in the first, lost much in the second, and in the third, the Seven Years' War (1756-1763), again became the scene of war and suffered renewed miseries. The country was deserted by its king and his minister, who retired to Poland. By the end of the war it had lost 90,000 men and a hundred million thalers, its coinage was debased and its trade ruined, and the whole country was in a state of frantic disorder. The elector died seven months after his return from Poland; Brühl died twenty-three days later. The elector's son and successor, Frederick Christian, survived his father only two months, leaving a son, Frederick Augustus III (1763-1827), a boy of thirteen. Prince Xavier, the elector's uncle, was appointed guardian, and he set himself to the sorely-needed work of healing the wounds of the country. The foundation of the famous school of mining at Freiberg, and the improvement of the Saxon breed of sheep by the importation of merino sheep from Spain, were due to his care. Frederick assumed the government in 1768, and in his long and eventful reign, which saw the electorate elevated to the dignity of a kingdom, though deprived of more than half its area, he won the surname of the Just. As he was the first king of Saxony, he is usually styled Frederick Augustus I. The first ten years of his active reign passed in peace and quiet, agriculture, manufactures, and industries were fostered, economical reforms instituted, and the heavy public debt of forty million thalers was steadily reduced. In 1770 torture was abolished. When the Bavarian succession fell open in 1777, Frederick Augustus joined Prussia in protesting against the absorption of Bavaria by the Austrian emperor, and Saxon troops took part in the bloodless "potato-war." The elector commuted his claims in right of his mother, the Bavarian princess Maria Antonia, for six million florins, which he spent chiefly in redeeming Saxon territory that had been pawned to other German states. When Saxony joined the Fürstenbund in 1785, it had an area of 15,185 square miles and a population of nearly 2,000,000, but its various parts had not yet been combined into a homogeneous whole, for the two Lusatias, Querfurt, Henneberg, and the ecclesiastical foundations of Naumburg and Merseburg had each a separate diet and government, independent of the diet of the electorate proper. In 1791 Frederick declined the crown of Poland, although it was now offered as hereditary even in the female line. He remembered how unfortunate for Saxony the former Polish connexion had been, and he mistrusted the attitude of Russia towards the proffered kingdom. Next year saw the beginning of the great struggle between France and Germany. Frederick's conduct throughout was perhaps more pusillanimous than self-seeking, but it entailed its own

punishment. His first policy was one of selfish abstention, and from 1793 until 1796, when he concluded a definite treaty of neutrality with France, he limited his contribution to the war to the bare contingent due from him as a prince of the empire. When war broke out in 1806 against Napoleon, 22,000 Saxon troops shared the defeat of the Prussians at Jena, but the elector immediately afterwards snatched at Napoleon's offer of neutrality, and abandoned his former ally. At the peace of Posen (11th December 1806) Frederick entered the Confederation of the Rhine, assuming the title of king of Saxony, and promising a contingent of 20,000 men to Napoleon.

No change followed in the internal affairs of the new kingdom, except that Roman Catholics were admitted to equal privileges with Protestants. Its foreign policy was dictated by the will of Napoleon, of whose irresistibility the king was too easily convinced. In 1807 his submission was rewarded with the duchy of Warsaw and the district of Cottbus, though he had to surrender some of his former territory to the new kingdom of Westphalia. The king of Saxony's faith in Napoleon was momentarily shaken by the disasters of the Russian campaign, in which 21,000 Saxon troops had shared, and in 1813 he began to lean towards an alliance with Austria. Napoleon's victory at Lützen (May 2, 1813), however, suddenly restored all his awe for that great general, and the Saxon king and his Saxon army were once more at the disposal of the French. After the battle of Bautzen, Napoleon's headquarters were successively at Dresden and Leipzig. During the decisive battle at the latter town in October 1813, the popular Saxon feeling was displayed by the desertion of the Saxon troops to the side of the allies. Frederick was taken prisoner in Leipzig, and the government of his kingdom was assumed for a year by the Russians, who promptly turned its resources against its late French ally. Saxony was now regarded as a conquered country. Nothing but Austria's vehement desire to keep a powerful neighbour at a distance from her boundaries, preserved it from being completely annexed by the Prussians, who had succeeded the Russians in the government. As it was, the congress of Vienna assigned the northern portion, consisting of 7800 square miles, with 864,404 inhabitants to Prussia, leaving 5790 square miles, with a population of 1,182,744 to Frederick, who was permitted to retain his royal title. He was forced to acquiesce in the dismemberment of his kingdom, and to console himself with the reflexion that his share, though the smaller half, was richer, more populous, and more beautiful than the other.

From the partition in 1815 to the war of 1866 the history of Saxony is mainly a narrative of the slow growth of constitutionalism and popular liberty within its limits. Its influence on the general history of Europe ceased when the old German empire was dissolved. In the new empire it is too completely overshadowed by Prussia to have any objective importance by itself. Frederick lived twenty years after the division of his kingdom. The commercial and industrial interests of the country continued to be fostered, but only a few of the most unavoidable political reforms were granted. The fact that some of these had not been granted before is more significant than that they were granted now. Religious equality was extended to the Reformed Church in 1818, and the separate diet of Upper Lusatia abolished. Frederick Augustus was succeeded by his septuagenarian brother Antony (1827-1886), to the great disappointment of the people, who had expected a more liberal era under Prince Frederick Augustus, the king's nephew. Antony announced his intention of following the lines laid down by his predecessor. He accorded at first only a few trifling reforms, which were far from removing the popular discontent, while he retained the unpopular minister Einsiedel and continued the encouragement of the Roman Catholics. The old feudal arrangement of the diet, with its inconvenient divisions, was retained, and the privy council continued to be the depository of power. An active opposition began to make itself evident in the diet and in the press, and in 1830 riots in Leipzig and Dresden impressed the king with the necessity of concession. Einsiedel was cashiered, Prince Frederick Augustus assumed as co-regent, and a

constitution promised. After consultation with the diet the king promulgated a new constitution on September 4, 1831, which is the basis of the present government. An offer from Metternich of Austrian arms to repress the discontent by force had been refused. The feudal estates were replaced by two chambers, largely elective, and the privy council by a responsible ministry of six departments. Bernhard von Lindenau was the head of the first responsible cabinet, and the first constitutional assembly sat from January 27, 1833, till October 30, 1834. While Saxony's political liberty was thus enlarged, its commerce and credit were stimulated by the construction of railways. Antony had died in 1836, and Frederick Augustus II (1836-1854) became sole king. Growing interest in politics produced dissatisfaction with the compromise of 1831, and the liberal opposition grew numbers and influence. The burning questions were the publicity of legal proceedings and the freedom of the press, and on these the Government sustained its first crushing defeat in the lower or second chamber in 1842. Lindenau resigned in 1843. Religious considerations as to the recognition of the German Catholics and a new constitution for the Protestant Church began to mingle with purely political questions, and Prince John, as the supposed head of the Jesuit party, insulted at a review of the communal guards at Leipzig in 1845. The military rashly interfered, and several innocent spectators were shot. The bitterness which this occurrence provoked was intensified by a political reaction which was initiated about the same time under Von Konneritz. Warned by the sympathy evinced in Saxony by the revolutionary events at Paris in 1848, the king dismissed his reactionary ministry, and a liberal cabinet took its place in May 1848. The disturbed country was now conceded to the country. The privileges of the nobles were curtailed, the administration of justice was put on a better footing, the press was unshackled, publicity in legal proceedings was granted, trial by jury was introduced for some special cases, and the German Catholics were recognized. The feudal character of the first chamber was abolished, and its members made mainly elective from among the highest taxpayers, while an almost universal suffrage was introduced for the second chamber. The first demand of the overwhelmingly democratic diet returned under this reform bill was that the king should accept the Frankfort constitution. Frederick, alleging the danger of acting without the concurrence of Prussia, refused, and dissolved the diet. A public demonstration at Dresden in favour of the Frankfort constitution was prohibited as illegal on May 2, 1849. This at once awoke the popular fury. The king fled to the west and sought the safety of Dresden was almost deserted, troops, and the king fled to the Kongstern. The rebels then proceeded to appoint a provisional Government, consisting of Tschirner, Heubner, and Todt, though the true leader of the insurrection was the Russian Bakunin. Meanwhile Prussian troops had arrived to aid the Government, and after two days' fierce street fighting the rising was quelled. The bond with Prussia now became closer, and Frederick entered Saxony and Hanover into the temporary "alliance of the three kings." He was not sincere, however, in desiring to exclude Austria, and in 1850 accepted the invitation of that power to send deputies to Frankfort. The first chamber immediately protested against this step, and refused to consider the question of a pressing loan. The king retorted by dissolving the diet and summoning the old estates abolished in 1848. When a quorum, with some difficulty, was obtained, a plea put forward of resignation was put in. The constitution of the chambers has never been restored to the basis of 1848. The king himself was carried away with the reactionary current, and the people remained for the time indifferent. Von Beust became minister for both home and foreign affairs in 1852, and under his guidance the policy of Saxony became more and more hostile to Prussia and friendly to Austria. Saxony was not, however, able to withdraw from the customs union, which indeed conferred the very highest benefits on its trade and manufactures. The sudden death of the king, by a fall from his carriage in Tyrol, left the throne to his brother John (1854-1873), a learned and accomplished prince, whose name is known in German literature as a translator and annotator of Dante. His brother's ministers kept their portfolios, but then views gradually became somewhat liberalized with the spirit of the times. Beust, however, still retained his federalistic and philo-Austrian views. When war was declared between Prussia and Austria in 1866, Saxony declared the former's offer of neutrality, and, when a Prussian force crossed the border, the Saxon army under the king and the crown prince joined the Austrians in Bohemia. The entire kingdom, with the solitary exception of the Kongstern, was occupied by the Prussians. On the conclusion of peace Saxony lost no territory, but had to pay a war indemnity of ten million thalers, and was compelled to enter the North-German Confederation. Its army and its postal and telegraph system were placed under the control of Prussia, and its representation at foreign courts was entrusted to the Prussian embassies. Beust was forced to resign, and liberal measures in both church and state were actively carried through. John was succeeded in 1873 by his

elder son Albert (born 1828), who had won distinction as a general in the wars of 1866 and 1870. Under this prince the general course of politics has presented nothing of special importance, except perhaps the steady spread of the doctrines of social democracy, which has flourished especially in Saxony. A loyal member of the new German empire, Saxony has gradually transferred its sympathies from its old ally Austria to its new leader Prussia. In 1877 Leipzig was chosen as the seat of the supreme court of law for the empire.

The political history of the parts of Saxony left by the capitulation of Wittenberg to the Ernestine line, which occupy the eastern two generally styled Thuringia (Thüringen), is marked by a series of partitions, conquests, railways, and various combinations of territory among the various sons of the successive dukes. The principle of primogeniture was not introduced until the end of the 17th century, so that the Protestant Saxon dynasty, instead of building up a single compact kingdom for itself, has split into four petty duchies, of no political influence whatever. In 1547 the ex-electoral John Frederick the Magnanimous was allowed to retain Weimar, Jena, Eisenach, Gotha, Zennoburg, and Saalfeld, Altenburg and a few other districts were added to the Ernestine possessions by the treaty of Naumburg in 1554, and other additions were made from other sources. John Frederick, who had retained and transmitted to his descendants the title of duke of Saxony, forbade his sons to divide their inheritance, but his wishes were respected only until after the death of his eldest son in 1565. The two survivors then founded separate principalities at Weimar and Coburg, though attempts were made to exchange territories every two or three years. In 1598 Saxe-Coburg gave off the branch Saxe-Eisenach, and in 1608 Saxe-Weimar gave off Saxe-Altenburg, the elder Weimar line ending and the younger beginning with the latter date. By 1638 Weimar had absorbed both Coburg and Eisenach, Altenburg remained till 1672. John, duke of Saxe-Weimar, who died in 1605, is regarded as the common ancestor of the present Ernestine lines. In 1640 his three surviving sons ruled the duchies of Weimar, Eisenach, and Gotha. Eisenach fell in 1644 and Altenburg in 1672, thus leaving the dukes of Saxe-Weimar and Saxe-Gotha to become the ancestors of the modern ruling houses. Saxe-Weimar was still repeatedly divided, in 1668 a Saxe-Marksuhl appears, and about 1678 a Saxe-Jena and a new Saxe-Eisenach. All these, however, were extinct by 1741, and their possessions returned to the main line, which has since adopted the principle of primogeniture in 1719. The present grand-duchy of Saxe-Weimar-Eisenach is separately noted.

Saxe-Gotha was even more subdivided, and the climax was reached about 1680, when Gotha, Coburg, Memmingen, Romhild, Eisenberg, Hildburghausen, and Saalfeld were each the capital of a duchy. By the beginning of 1825 only the first three of these and Hildburghausen remained, the lands of the others having been divided after much quarrelling. In that year the Gotha line expired, and a general redistribution of the lands of the "Nexus Gothaens," as this group of duchies was called, was arranged on 12th November 1826. The duke of Hildburghausen gave up his lands entirely for Altenburg and became duke of Saxe-ALTEMBERG, the duke of Coburg exchanged Saalfeld for Gotha and became duke of Saxe-COBURG-GOTHA, and the duke of Saxe-MEMMINGEN received Hildburghausen, Saalfeld, and some other territories, and added Hildburghausen to his title. These duchies are separately noted. See also THURINGIA.

GEOGRAPHY AND STATISTICS

The kingdom of Saxony, the history of which has been traced above, is the third constituent of the German empire in point of population, and the fifth in point of area. With the exception of the two small exclaves of Ziegenhain in Saxe-ALTEMBERG and Leisnigwitz on the borders of Hesse, Saxe-Weimar and Saxe-Altenburg, it forms a compact whole of a triangular shape, its base extending from north-east to south-west, and its apex pointing north-west. It lies between 50° 10' and 51° 29' N lat and between 11° 53' and 15° 4' E long. The total area is 5789 square miles (about half the size of Belgium), or 2.7 per cent of the entire empire, its greatest length is 180 miles, and its greatest breadth 93 miles. Its frontiers have a circuit of 760 miles. On the south it is bounded by Bohemia, on the west by Bavaria and the Thuringian states, and on the remaining sides by Prussia. Except on the south, where the Erzgebirge forms at once the limit of the kingdom and of the empire, the boundaries are entirely political. For administrative purposes the kingdom of Saxony is divided into the four districts of Bautzen in the south-east, Dresden in the north-east, Leipzig in the north-west, and Zwickau in the south-west.

Physical Features—Saxony belongs almost entirely to the central mountain region of Germany, only the districts along the north border and around Leipzig descending into the great North-European plain. The average elevation of the country is not, however, great; and it is more properly described as hilly than as mountainous. The ordinary estimates return one-fifth of the area as

plain, two-fifths as hill country, and two fifths as mountain land. The slope is very regularly from south-east to north-west, in the direction of the shorter axis. The chief mountain range is the Erzgebirge, stretching for 90 miles along the south border, and reaching in the Fichtelberg (3979 feet and 3959 feet) the highest elevation in the kingdom. The west and south-west half of Saxony is more or less occupied by the ramifications and subsidiary groups of this range, one of which is known from its position as the Central Saxon chain, and another lower group still farther north as the Oschatz group. The south-east angle of Saxony is occupied by the mountains of Upper Lusatia (highest summit 2600 feet), which form the link between the Erzgebirge and Kiesegebirge in the great Silesian chain. North-west of the Erzgebirge, and along both banks of the Elbe, which divides it from the Erzgebirge, extends the picturesque mountain region known as the Saxon Switzerland. The action of water and ice upon the soft sandstone of which the hills here are chiefly composed has produced remarkable formations of deep gorges and isolated fantastic peaks, which, however, though both beautiful and interesting, by no means recall the characteristics of Swiss scenery. The highest summit attains a height of 1890 feet, but the more interesting peaks, as the Lahenstein, Königstein, and the Bastei, are lower. With the trifling exception of the south-east of Bautzen, which sends its waters by the Neisse to the Oder, Saxony lies wholly in the basin of the Elbe, which has a navigable course of 73 miles from south-east to north-west through the kingdom. Comparatively few of the numerous smaller streams of Saxony flow directly to the Elbe, and the larger tributaries only join it beyond the Saxon border. The Elbe, therefore, receives the waters of the second river of Saxony; others are the Black Elster, the White Elster, the Pleisse, and the Spree. There are no lakes of any size, but mineral springs are very abundant. The best known is at Bad Elster in the Vogtland.

Climate.—The climate of Saxony is generally healthy. It is mildest in the valleys of the Elbe, Mulde, and Pleisse, and severest in the Erzgebirge, where the district near Johannegegendstätt is known as Saxon Siberia. The average temperature, like that of central Germany as a whole, varies from 48° to 50° Fahr., in the Elbe valley the mean in summer is from 62° to 64°, and in winter about 30°, in the Erzgebirge the mean temperature in summer is from 55° to 57°, and in winter 28° or 24°. The Erzgebirge is also the rainiest district, 27½ to 33½ inches falling per annum, the amount decreases as we proceed northwards, and Leipzig with an annual fall of 16½ to 21½ inches enjoys the driest climate.

Soil.—Saxony is the most fertile part of Germany, and in regard to the productive occupation of its soil it stands among the most advanced nations of the world. Only 1 per cent. of the total area is waste or unused. According to the returns for 1888, 55.7 per cent. of the area is under agriculture, 11.7 in pasture and meadow, 27.4 under forest, and 4.2 occupied by buildings, roads, and water. The lower lands are the most productive, and fertility diminishes as we move inland. The richest part of Saxony is the black crest of the Erzgebirge cultivation ceases altogether. Saxon agriculture, though dating its origin from the Wendes, has received its full development only in the present century. Long fettered by antiquated customs, the land was subdivided into small parcels and subjected to vexatious rights. But in 1834 a law was passed providing for the union of the scattered lands belonging to each proprietor, and that may be considered the dawn of modern Saxon agriculture, which has since attained a very high excellence.

It has been fostered both publicly and privately, and a special official secretary assists the minister of the interior in attending to this branch of national prosperity. In 1833 the agricultural lands in Saxony were divided among 192,000 farmers or proprietors, of whom only 758 held 250 acres and upwards, 28,200 between 25 and 250 acres, and the rest less than 25 acres. The small proprietors held 27.7 per cent. of the total area, the middle class 57.2, and the large as only 14.1. The richest part districts are near Meissen, Gumbinnen, Bautzen, Döbeln, and Erima. The chief crop is rye, but oats are hardly second to it. Wheat and barley are grown in considerably less quantity. Very large quantities of potatoes are grown, especially in the Vogtland. Beet is chiefly grown as feeding stuff for cattle, and not for sugar. Flax (3270 acres in 1833) is grown in the Erzgebirge and Lusatian mountains, where the manufacture of linen was at one time a flourishing domestic industry. Saxony owes its unusual wealth in fruit to the care of the paternal elector Augustus (1553–1586), who is said never to have stirred abroad without fruit seeds for distribution among the peasants and farmers. Enormous quantities of cherries, plums, and apples are annually borne by the trees round Leipzig, Dresden, and Colditz. The cultivation of the vine in Saxony is respectable for its antiquity, though the yield is insignificant. Wine is said to have been grown in the 11th century, the Saxon vineyards chiefly on the banks of the Elbe near Meissen and Dresden, occupied 2515 acres in 1838.

Live Stock.—According to returns made for 1883 Saxony contained 126,846 horses, 651,329 cattle, 149,037 sheep, 355,550 pigs, and 116,577 goats. The breeding of horses is carried on to a very

limited extent in Saxony, more than nine-tenths of the horses required being imported. Cattle-raising, which has been an industry since the advent of the Wendes in the 6th century, has attained very considerable importance on the extensive pastures of the Erzgebirge and in the Vogtland. Sheep-farming has considerably declined within the last few decades, as in most parts of northern Germany. While other classes of domestic animals have retained very much the same proportion to the number of the human population, sheep have decreased from one to every six inhabitants in 1861 to one to every twenty in 1883. In 1765 the regent Prince Xavier imported 300 merino sheep from Spain, and so improved the native breed by this new strain that Saxon sheep were eagerly imported by foreign nations to improve their flocks, and “Saxon electoral wool” became one of the best brands in the market. The high level was not long maintained, flock-masters began to pay more attention to quantity than to quality of wool, and the Saxon wool has accordingly deteriorated. In 1868 no less than 1,166,130 lbs of wool were offered for sale in the wool markets of Saxony, of which Leipzig and Dresden are the chief, in 1884 only 276,848 lbs were offered. Swine furnish a very large proportion of the flesh-diet of the people. Gese abound particularly round Leipzig and in Upper Lusatia, poultry about Bautzen. Bee-keeping flourishes on the heaths on the right bank of the Elbe, in 1883 there were 53,756 bee-hives in Saxony. Game is not very abundant, hares and partridges are shot in the plains to the north-west.

Forests.—The forests of Saxony are extensive, and have long been reserved for both by Government and by private proprietors. The famous school of forestry at Tharandt was founded in 1811. The Vogtland is the most densely wooded portion of the kingdom, and next comes the Erzgebirge. About 8,379,200 acres, or 85 per cent. of the whole forest land, were planted with coniferous trees, and about 1,439,700 acres or 15 per cent with deciduous trees, among which beeches and birches are the commonest. About 30 per cent. of the total belongs to Government.

Minerals.—The minerals of Saxony are very considerable, and its mines are among the oldest in Germany. Silver was raised in the 12th century, and argentiferous lead is still the most valuable ore mined, tin, iron, and cobalt rank next, and coal is one of the chief exports. Copper, zinc, and bismuth are also worked. Saxon mines now produce about 6 per cent. of the gross quantity, and about 8 per cent. of the aggregate value of metals raised in Germany. The country is divided into four mining districts, where silver has been raised, the first was in 1811, Altenberg, where tin is mainly raised; Schneeberg, yielding cobalt, nickel, and ironstone, and Johanngegendstätt, with ironstone and silver mines. There are in all 236 mines, but in 1883 only 150 of these were in operation, employing 8615 hands. In 1870 253 mines employed 9132 hands. The total value of metal raised in Saxony in 1883 was £288,200, in 1870 it was £214,916. It is found principally in the two districts near Zwickau, and the other in the circle of Dresden. Brown coal or lignite is found chiefly in the north and north-west, but in sufficiently large quantities to be exported. The number of coal-mines is steadily decreasing, though the numbers of miners and the gross produce are both on the increase. The following table shows the output in tons since the years named—

	Mines	Hands	Coal	Lignite	Anthracite	Value
1870	242	16,311	2,608,705	506,687	846	£1,083,625
1880	189	19,625	3,622,007	590,119	345	1,863,780
1883	166	20,136	4,088,484	648,044	280	1,510,863

Peat is especially abundant on the Erzgebirge. Immense quantities of bricks are made all over the country. Excellent quantities of granite are found on the hills of the Elbe. In 1883 298 quarries employed 1349 hands. Fine poudelon clay occurs near Meissen, and coarser varieties elsewhere. A few precious stones are found among the southern mountains. Saxony has no salt-mines.

Industries.—The Central-European position of Saxony has fostered its commerce, and its manufactures have been encouraged by the abundant water-power throughout the kingdom. Nearly one-half is the motive power used in Saxon manufactures is supplied by the streams, of which the Mulde, in this respect, is the chief. The early foundation of the Leipzig fairs, and the enlightened policy of the rulers of the country, have also done much to develop its commercial and industrial resources. Next to agriculture, which supports about 20 per cent. of the population, by far the most important industry is the textile. Saxony carries on 26 per cent. of the whole textile industry in Germany, a share far in excess of its proportionate population. Prussia, which has more than nine times as many inhabitants, carries on 45 per cent., and no other state more than 8 per cent. Nearly 184 per cent. of the population were engaged in this industry in 1882, by far the largest proportion in any German state except Reuss (after Limer), which had 36 per cent. so engaged. The chief seats of the

manufacture are Zwickau, Chemnitz, Glauchau, Meersau, and Hohenstein in the south of Zwickau, and Chemnitz, Pilsnitz, and Bischofsberga in the north of Dresden. The centre of the cotton manufacture (especially of cotton hosiery) is Chemnitz; cotton-mills are made throughout the Voigtland, ribbons at Pilsnitz and its neighbourhood. Woollen cloth and buckskin are woven at Chemnitz, Bischofsberga, and Gossensfeld, all in the north-east, woollen and half-woollen underclothing at Chemnitz, Glauchau, Meersau, and Rachenbach, while Bautzen and Limbach produce woollen stockings. Linen is manufactured chiefly in the mountains of Lusatia, where the looms are still to some extent found in the homes of the weavers. The coarse kinds only are now made, owing to the keen English competition in the finer varieties. Damask is produced at Goss-Schönau, and Non-Schönau. Lace-making, discovered or introduced by Barbara Uttmann in the latter half of the 18th century, and now fostered by Government schools, has long been an important domestic industry among the villages of the Erz Mountains. Straw-plaiting occupies 6000 hands on the mountain slopes between Gottleben and Lockwitz. Waxcloth is manufactured at Leipzig, and artificial flowers at Leipzig and Dresden. Stoneware and earthenware are made at Chemnitz, Zwickau, Bautzen, and Meissen, porcelain ("Dresden china") at Meissen, chemicals in and near Leipzig. Dobeln, Weidau, and Losenitz are the chief seats of the Saxon leather trade, cigars are very extensively made in the town and district of Leipzig, and hats and pianofortes at Leipzig, Dresden, and Chemnitz. Paper is made chiefly in the west of the kingdom, but does not keep pace with the demand. Machinery of all kinds is produced, from the sewing-machine at Dresden to the steam-locomotive and marine-engine of Chemnitz. The last-named place, though the centre of the non-manufacture of Saxony, has to import every pound of iron by railway. The leading branch is the machinery used in the industries of the country—mining, paper-making, and weaving. The very large printing trade of Leipzig encourages the manufacture of printing-presses in that city. In 1868-69 Saxony contained 744 active breweries and 683 distilleries. The tendency in this branch of industry is to extinguish the smaller establishments, and to form large joint-stock companies. The smelting and refining of the metal ores is also an important industry. The chief smelting works, at Freiberg, employed 1877 hands in 1868.

Trade—Leipzig, with its famous and still frequented fairs, is the focus of the trade of Saxony. The fair trade between eastern and western Europe and the stock-trade of Germany centre here. Chemnitz, Dresden, Plauen, Zwickau, Zittau, and Bautzen are the other chief commercial cities. The principal exports are wool, woollen, cotton, and linen goods, and the other produce of the factories and of the mines.

Communication—The roads of Saxony are numerous and good. In 1868 there were 2304 miles of road in the kingdom. Saxony was the first German state to encourage and adopt the railway system, and, although at first private enterprise led the way, the Saxon lines are now almost exclusively in the hands of Government. The first railway, between Leipzig and Aichen, was opened on April 24, 1837. In 1837 there were 9 miles of state railway, in 1840, 71 miles, in 1860, 250, in 1870, 685, in 1880, 1184, and in 1884, 1865 miles, which, together with 75 miles of private line, mostly worked by the state, employed 24,400 hands. There are no canals in Saxony, and the only navigable river is the Elbe. **Population**—In 1880 the population of Saxony was 2,972,805, or 61 per cent of the total population of the German empire, on 2.7 per cent of its area. The provisional returns of the census of 1885 gave a population of 3,176,193. With the exception of the five towns, Saxony is the most densely peopled member of the empire, and its population is increasing at a more rapid rate than is the case in any of the larger German states. In 1860 Saxony had 513.5 inhabitants per square mile, nearly three times as many as Bavaria, Prussia had 202.5, and the average for the empire was 216.7. More than half (56 per cent) of the people live in communities of over 2000 inhabitants. The following table shows the distribution of the population among the four administrative districts. It will be noticed that the industrial district of Zwickau is the most densely peopled.

District	Population	Area in Square Miles	Average per Square Mile
Bautzen	351,826	953	368.6
Dresden	808,512	1676	482.7
Leipzig	707,828	1377	514.0
Zwickau	1,106,141	1784	619.4

The growth of the population since 1816, when the kingdom received its present limits, has been as follows—In 1815, 1,178,802, in 1830, 1,402,066, in 1840, 1,706,275, in 1864, 2,444,084, and in 1875, 2,760,688.

The number of marriages per 1000 inhabitants is between 8 and

9, the birth-rate is 43, and the death-rate 30 per thousand. The annual increase of the population, on the average of the five years between 1875 and 1880, is at the rate of 1.43 per cent. The death-rate in Saxony is the highest in Germany, but its birth-rate is also the highest, except in the small state of Reuss (after Reuss). In 1883, out of 132,200 births, 16,990, or 12.8 per cent, were illegitimate, and 4985, or 3.7 per cent, were still-born, and these rates represent tolerably accurately the average of the last few years. In the relative number of suicides (311 per 1,000,000 inhabitants) Saxony ranks highest among the European states (see Moissell, *Lat. Sec. Sei.*, vol. xxxvi). In 1884 1114 persons, of whom 861 were males, committed suicide. In the same year 17,706 persons were punished as vagabonds.

The prepotent industrial activity of Saxony fosters the tendency of the population to concentrate in towns, with the exception of the free towns and Anhalt; no German state has so large a proportion of urban population, 26, inhabitants residing in communities of 2000 persons and upwards. In the empire as a whole 41.4 per cent of the population is urban in this sense, in Saxony the proportion rises to 56.5 per cent. The largest towns are Dresden (245,615 inhabitants), the capital since the middle of the 16th century, Leipzig (170,076), and Chemnitz (110,693). Eighteen other towns, chiefly in the manufacturing district of Zwickau, have over 10,000 inhabitants, and thirty-five between 5000 and 10,000. The main results of the industrial census of 1882, which shows an increase of population since 1880 of 42,000, are summarized in the following table, which gives the number of persons (including wives, families, and dependants) supported by the several occupations, and the percentage of the total population—

Occupations	Persons	Percentage
1 Agriculture, forestry, and fishing	602,378	20
2 Industrial pursuits	1,696,896	56.2
3 Trade	860,675	12
4 Domestic servants and general labourers	53,584	1.7
5 Official, military, and professional classes	148,361	5
6 Not returned under any occupation	153,929	5.1

The people of Saxony are chiefly of pure Teutonic stock, a proportion are Germanized Slavs, and in the south of Bautzen there are still about 30,000 Wends, who retain the Saxon name and language. In some villages near Bautzen hardly a word of German is spoken.

Religious Statistics—About 97 per cent of the inhabitants of Saxony are Protestants, between 6000 and 7000 are Jews, and the remainder, including the royal family, are mostly Roman Catholics. According to the religious census of 1880, 2,886,806 were Evangelicals, 74,333 Roman Catholics, 1467 German Catholics, 620 Anglicans, 453 Greek Catholics, 6518 Jews, and 399 "others." The Evangelical-Lutheran or State Church had 1130 pastors and 1393 places of worship in 1884. Its head is the minister, "de evangelicus," so long as the king is Roman Catholic, and its management is vested in the Evangelical Consistory at Dresden. Its representative assembly, consisting of twenty-nine lay clergymen and thirty-five laymen is called a synod (*Synode*). The Roman Catholic Church has enjoyed the patronage of the reigning family since 1697, though it was the peace of Posen (1806) which placed it on a level with the Lutherans. By the peace of Prague, which transferred Upper Lusatia to Saxony in 1635, stipulations were made in favour of the Roman Catholics of that region, who are ecclesiastically in the jurisdiction of the cathedral chapter of St Peter at Bautzen, the dean of which has *ex officio* a seat in the first chamber of the diet. The other districts are managed by an apostolic vicariate at Dresden, under the direction of the minister of public worship. The monasteries in Bautzen are the only conventual establishments in Saxony, and no others may be founded. Among the smaller religious sects the MORAVIAN BROTHERS (*q. v.*), whose chief seat is at Harnuth, are perhaps the most interesting. In 1868 civil rights were declared to be independent of religious confession.

Education—Saxony claims to be one of the most highly educated countries in Europe, and its foundations of schools and universities were among the earliest in Germany. Of the four universities founded by the Saxon electors at Leipzig, Jena, Wittenberg, and Erfurt, only the first is included in the present kingdom of Saxony. It is second only to Berlin in the number of its students. The endowed schools (*Fustenschulen*) at Meissen and Grimma have long enjoyed a high reputation. Besides these there are 12 other gymnasia, 13 realschulen of the first class, and 19 of the second class, the organization of which resembles that already described in detail under Prussia. There are nearly 4000 elementary and primary schools, and education is compulsory. Of 856 recruits in 1883-84 only 13 (1.5 per cent) were unable to read and write. Saxony is particularly well-equipped with technical schools, the textile industries being especially fostered by numerous schools of weaving, embroidery, lace-making, &c., but the mining academy at Freiberg and the school of forestry at Tharandt are probably the

hausen), chemicals (Stassfurt), and starch. Beer is also brewed extensively in Prussian Saxony, where the annual consumption per head (107 quarts) is considerably in excess of the average for the kingdom. Trade is much facilitated by the great waterway of the Elbe, as well as by a very complete system of railways. The chief articles are wool, grain, sugar, salt, lignite, and the principal manufactured products named above.

The population of the province of Saxony in 1880 was 2,312,007, including 2,154,693 Protestants, 145,518 Roman Catholics, and 6700 Jews, in 1885, according to provisional census returns, the population was 2,427,968. The great bulk of the inhabitants are of unmixed German stock, but many of those in the east part of the province have Wendish blood in their veins. The province belongs to the more thickly populated parts of Germany, the average being 287 persons to the square mile, and the ratio of the urban population to the rural is about as 4½ to 5½. The occupation census of 1882 gives the following percentages for the different classes of the population—agricultural, 36.78, industrial, 35.18, trade, 8.15, domestic servants and day labourers, 8.70, official and professional, 5.12.

Prussian Saxony is divided into the three government districts of Magdeburg, Merseburg, and Erfurt. Magdeburg is the most important town and the headquarters of an army corps, but the provincial chambers meet at Merseburg. The province sends twenty members to the reichstag and thirty-eight to the Prussian house of representatives. The religious control of the district is in the hands of a consistory at Magdeburg; the Roman Catholics belong to the diocese of Paderborn. The university of Halle holds a high rank among German seats of learning, and the other educational requirements of the province are adequately provided for. The illiterate recruits of this province in 1888-4 numbered only 18 out of a total of 7898, equivalent to 0.17 per cent. The principal towns are Magdeburg (about 150,000 inhabitants, including Neustadt and Buckau), Halle (81,869), Erfurt (58,307), Halberstadt (34,048), Nordhausen, Mühlhausen, and Aschersleben.

The history of the present Prussian province of Saxony as such dates only from 1815, and is of course merely of local interest. The previous history of its constituent parts, of considerable more interest and importance, must be sought for under the various headings that will suggest themselves, such as SAXONY (*supra*), PRUSSIA, MAGDEBURG, ERFURT, &c. It is, however, worth noting that the province comprises the Altmark or old North Mark that formed the kernel of the Prussian state (see PRUSSIA, vol. xx p. 2), and also the old Saxon lands on the Elbe and Saale, from which as a centre the Christianization of Germany mainly spread. And the leading position of this part of Germany in promoting the Reformation should also be remembered.

SAY, JEAN BAPTISTE (1767-1832), an eminent French political economist, was born at Lyons 5th January 1767. His father, Jean Etienne Say, was of a Protestant family which had originally belonged to Nîmes, but had removed to Geneva for some time in consequence of the revocation of the edict of Nantes. Young Say was intended to follow a commercial career, and was accordingly sent, with his brother Horace, to England, and lived first at Croydon, in the house of a merchant, to whom he acted as clerk, and afterwards at London, where he was in the service of another employer. When, on the death of the latter, he returned to France, he was employed in the office of a life assurance company directed by Clavière, afterwards known in politics. It was Clavière who called his attention to the *Wealth of Nations*, and the study of that work revealed to him his vocation. His first literary attempt was a pamphlet on the liberty of the press, published in 1789. He worked under the celebrated Mirabeau on the *Courrier de Provence*. In 1792 he took part as a volunteer in the campaign of Champagne, in 1793 he assumed, in conformity with the Revolutionary fashion, the pre-name of *Athicus*, and became secretary to Clavière, then finance minister. He married in 1793 Mlle Deloche, daughter of a former *avocat au conseil*, the young pair were greatly straitened in means in consequence of the depreciation of the assignats. From 1794 to 1800 Say edited a periodical entitled *La Décade philosophique, littéraire, et politique*, in which he expounded the doctrines of Adam Smith. He had by this time established his reputation as a publicist, and, when the consular government was established in the year VIII (1799), he was selected as one of the hundred members of the tribunate,

and resigned, in consequence, the direction of the *Décade*. He published in 1800 *Olivier, ou Essai sur les moyens de réformer les mœurs d'une nation*.

In 1803 appeared his principal work, the *Traté d'Economie Politique*. In 1804, having shown his unwillingness to sacrifice his convictions for the purpose of furthering the designs of Napoleon, he was removed from the office of tribune, being at the same time nominated to a lucrative post, which, however, he thought it his duty to resign. He then turned to industrial pursuits, and, having made himself acquainted with the processes of the cotton manufacture, founded at Auchy, in the Pas de Calais, a spinning-mill which employed four or five hundred persons, principally women and children. He devoted his leisure hours to the improvement of his economic treatise, which had for some time been out of print, but which the censorship did not permit him to republish, and in 1814 he availed himself (to use his own words) of the sort of liberty arising from the entrance of the allied powers into France to bring out a second edition of the work, dedicated to the emperor Alexander, who had professed himself his pupil. In the same year the French Government sent him to study the economic condition of Great Britain. The results of his observations during his journey through England and Scotland appeared in a tract *De l'Angleterre et des Anglais*, and his conversations with distinguished men in those countries contributed, he tells us, to give greater correctness to the exposition of principles in the third edition of the *Traté*, which appeared in 1817. A chair of industrial economy was founded for him in 1819 at the Conservatoire des Arts et Métiers, in which he lectured with ability and success. In 1831 he was made professor of political economy at the Collège de France. He published in 1828-30 his *Cours Complet d'Economie Politique pratique*, which is in the main an expansion of the *Traté*, with practical applications. In his later years he became subject to attacks of nervous apoplexy, which increasingly reduced his strength. He lost his wife, to whom he was fondly attached, in January 1830, and from that time his health constantly declined. When the revolution of that year broke out, he was named a member of the council-general of the department of the Seine, but found it necessary to resign that position. He died at Paris 16th November 1832, leaving behind him a well-earned reputation for private worth and political integrity.

Say was essentially a propagandist, not an originator. His great service to mankind lies in the fact that he disseminated throughout Europe by means of the French language, and popularized by his clear and easy style, the economic doctrines of Adam Smith. It is true that his French panegyrists (and he is not himself free from censure on this score) are unjust in their estimate of Smith as an expositor, they give false or exaggerated ideas of his obscurity, his polixity, and his want of method, and they accordingly extol too highly the merits of Say. Those merits are, however, real and considerable, his writings were without doubt very effective in diffusing throughout Continental Europe a taste for economic inquiry and a knowledge of its principal results. On the side of the philosophy of science Say is weak, his observations on that subject are usually commonplace or superficial. Thus he accepts the shallow dictum of Condillach that *toute science se réduit à une langue bien faite*. He recognizes political economy and statistics as alike sciences, and represents the distinction between them as having never been made before him, though he quotes what Smith had said of political arithmetic. Whilst always deserving the praise of honesty, sincerity, and independence, he is very inferior to his great predecessor in breadth of view on moral and political questions. In his general conception of human affairs there is a tendency to regard too exclusively the material side of things, which made him pre-eminently the economist of the French liberal bourgeoisie, this Storchi justly censures the levity with which he doubts the necessity of a public religious cultus, suggesting that enlightened nations might dispense with it "as the Pacific Islanders do." He is inspired with the dislike and jealousy of Governments so often felt and expressed by thinkers formed in the social atmosphere of the last century. Soldiers are for him not merely

unproductive labourers, as Smith called them, they are rather "destructive labourers." "A nation might," he says, "strictly speaking, subsist without a government, each profession exchanging the fruits of its labours with the products of the labours of others,"—a remark which betrays the notion that economic concludes with social life. Taxes on unproductive labourers, then, are plagues like hail, war, or depredation, they may fitly be described as of the nature of robbery. When he says, "Lorsqu'on vous vend un privilège, comme le droit de chasse, ou seulement de port d'armes, on vous vole votre droit naturel d'être armé pour le vous vendre après l'avoir volé," we see that we are still in the region of the *ius naturalis*, which lies at the basis of all the old economies. Say is considered to have broken the importance of capital as a factor in production more distinctly than the English economists, who unduly emphasized labour. The special doctrines most commonly mentioned as due to him are—(1) that of "immaterial products," and (2) what is called his "théorie des débouchés." Objecting, as German Garnier had done before him, to Smith's well-known distinction between productive and unproductive labour, he maintains that, production consisting in the creation or addition of a utility, all useful labour is productive. He is thus led to recognize immaterial products, whose characteristic quality is that they are consumed immediately and are incapable of accumulation, under this head are to be ranged the services rendered either by a person, a capital, or a portion of land, as, e.g., the advantages derived from medical attendance, or from a hired house, or from a beautiful view. But in working out the consequences of this view Say is not free from the same errors which beset Ricardo and Malthus, and by his comprehension of these immaterial products within the domain of economics he is confirmed in the error of regarding that science as filling the whole sphere which really belongs to sociology. His "théorie des débouchés" amounts to this, that, products being, in last analysis, purchased only with products, the extent of the markets (or outlets) for home products is proportional to the quantity of foreign productions, while the sale of any commodity is dull, it is because there is not a sufficient number, or rather value, of other commodities produced with which it could be purchased. Another proposition on which Say insists is that every value is consumed and is created only to be consumed. Values can therefore be accumulated only by being reproduced in the course of, as often happens, by the very act of consumption, hence his distinction between the expenditure of foreign productions, which he calls consumption, and the expenditure of domestic products, which he calls accumulation. We find in him other corrections or new presentations of views previously accepted, and some useful suggestions for the improvement of nomenclature.

Say's writings occupy vols. ix-xv of Guillaumin's *Collection des Principaux Économistes*. Among them are, in addition to those already mentioned, *Catéchisme d'Economie Politique*, 1818. *Petit Volume contenant les principes des Hommes et de la Société, Lettres à Malthus sur différents sujets d'Economie Politique*, 1820, *Épître des Principes de l'Economie Politique*, 1831. A volume of *Discours et Conférences* published posthumously by Charles Comte, author of the *Traité de Législation*, who was his son-in-law. To the above must be added an addition of Storck's *Cours d'Economie Politique*, which Say published in 1828 without Storck's authorization, with notes embodying a "critique amicale et virulente," a proceeding which Storck justly resented. The last edition of the *Traité d'Economie Politique* which appeared during the life of the author was the 6th (1829), the 6th, with the author's final corrections, was edited by the eldest son, Housseau Emile Say, himself known as an economist, in 1848. The work was translated into English from the 4th edition of the French by C. R. Fries (1841), into German by Ludwig Heinrich von Jakob (1807) and by C. Ed. Morstadt (1818, and 1830), and, as Say himself informs us, into Spanish by José Quevedo. The *Cours d'Economie Politique* is a treatise, from which Morstadt had given extracts, was translated into German by Max Stüler (1845). The *Catéchisme* and the *Petit Volume* have also been translated into several European languages. An English version of the *Lettres à Malthus* appears in vol. xvi of the *Paraphraser*, 1821.

SCALA NOVA, SCALA NUOVA, or (Turkish) KUSHADASI, also known as Nova Ephesus, a harbour on the west coast of Asia Minor, in the vilayet of Airdin, opposite the island of Samos. Before the opening of the Smyrna-Airdin railway its excellent roadstead was largely frequented by vessels trading with the Anatolian coast, and it has often been proposed to connect it with this system by a branch line, and thus enable it to compete with Smyrna as a trading centre. The population is estimated at 7000 to 10,000, of whom about 3000 are Greeks.

SCALIGER. For some account of the great Della Scala (Lat. *Scaliger*) family, the reader is referred to the article VERONA. The name has also been borne by two scholars of extraordinary eminence in the world of letters.

I JULIUS CÆSAR SCALIGER (1484-1558), so distinguished by his learning and talents that, according to De Thou, no one of the ancients could be placed above him and the age in which he lived could not show his equal, was, according to his own account, a son of the illustrious house of La Scala, for a hundred and fifty years princes of

Verona, and was born in 1484 at the castle of La Rocca on the Lago de Garda. At the age of twelve he was presented to his kinsman the emperor Maximilian, and placed by him among his pages. He remained for seventeen years in the service of the emperor, following him in his expeditions through half Europe, and distinguishing himself no less by personal bravery as a soldier than by military skill as a captain. But he was unimpaired neither of letters, in which he had the most eminent scholars of the day as his instructors, nor of art, which he studied with considerable success under Albert Dürer. In 1512 he fought at the battle of Ravenna, where his father and elder brother were killed. He there displayed prodigies of valour, and received the highest honours of chivalry from his imperial cousin, the emperor conferring upon him with his own hands the spurs, the collar, and the eagle of gold. But this was the only reward he obtained for his long and faithful devotion. He left the service of Maximilian, and after a brief employment by another kinsman, the duke of Ferrara, he decided to quit the military life, and in 1514 entered as a student at the university of Bologna. He determined to take holy orders, in the expectation that he would become in due time cardinal, and then be elected pope, when he would wrest from the Venetians his principality of Verona, of which the republic had despoiled his ancestors. But, though he soon gave up this design, he remained at the university until 1519. The next six years he passed at the castle of Vico Nuova, in Piedmont, as a guest of the family of La Rovere, at first dividing his time between military expeditions in the summer, in which he achieved great successes, and study, chiefly of medicine and natural history, in the winter, until a severe attack of rheumatic gout brought his military career to a close. Henceforth his life was wholly devoted to study. In 1525 he accompanied M. A. de la Rovere, bishop of Agen, to that city as his physician. Such is the outline of his own account of his early life. It was not until some time after his death that the enemies of his son first alleged that he was not of the family of La Scala, but was the son of Benedetto Bordonio, an illuminator or schoolmaster of Verona, that he was educated at Padua, where he took the degree of M.D., and that his story of his life and adventures before arriving at Agen was a tissue of fables. It certainly is supported by no other evidence than his own statements, some of which are inconsistent with well-ascertained facts.

The remaining thirty-two years of his life were passed almost wholly at Agen, in the full light of contemporary history. They were without adventure, almost without incident, but it was in them that he achieved so much distinction that at his death in 1558 he had the highest scientific and literary reputation of any man in Europe. A few days after his arrival at Agen he fell in love with a charming orphan of thirteen, Andiette de la Roque Lobejac. Her friends objected to her marriage with an unknown adventurer, but in 1528 he had obtained so much success as a physician that the objections of her family were overcome, and at forty-five he married Andiette, who was then sixteen. The marriage proved a complete success; it was followed by twenty-nine years of almost uninterrupted happiness, and by the birth of fifteen children.

A charge of heresy in 1538, of which he was acquitted by his friendly judges, one of whom was his friend Arnoul Le Ferron, was almost the only event of interest during these twenty-nine years, except the publication of his books, and the quarrels and criticisms to which they gave rise.

In 1531 he printed his first oration against Erasmus, in defence of Cicero and the Ciceronians. It is a piece of

vigorous invective, displaying, like all his subsequent writings, an astonishing knowledge and command of the Latin language, and much brilliant rhetoric, but full of vulgar abuse, and completely missing the point of the *Ciceronismus* of Erasmus. The writer's indignation at finding it treated with silent contempt by the great scholar, who thought it was the work of a personal enemy—Aleander—caused him to write a second oration, more violent, more abusive, with more self-glorification, but with less real merit than the first. The orations were followed by a prodigious quantity of Latin verse, which appeared in successive volumes in 1533, 1534, 1539, 1546, and 1574, of these, a friendly critic, M. Pattison, is obliged to approve the judgment of Huet, who says, "par ses poésies brutes et informes Scalger a deshonore le Parnasse," yet their numerous editions show that they commended themselves not only to his contemporaries but to succeeding scholars. A brief tract on comic metres (*De Comicis Dimensioibus*) and a work *De Causis Lingue Latine*—the earliest Latin grammar on scientific principles, and following a scientific method—were his only other purely literary works published in his lifetime. His *Poetics* was left unpublished, and only appeared in 1561 after his death. With many paradoxes, with many criticisms which are below contempt, and many indecent displays of violent personal animosity,—especially in his reference to the unfortunate Dolet, over whose death he gloated with brutal malignity,—it yet contains much acute criticism, and shows that for the first time a writer had appeared who had formed an adequate idea of what such a treatise ought to be, and how it ought to be written.

But it is as a philosopher and a man of science that J C Scalger ought to be judged. His tastes were for metaphysics and physics rather than for literature. Classical studies he regarded as an agreeable relaxation from severer pursuits. Whatever the truth or fable of the first forty years of his life, he had certainly been a most close and accurate observer, and had made himself acquainted with many curious and little-known phenomena, which he had stored up in a most tenacious memory, and which he was able to make use of with profit. His scientific writings are all in the form of commentaries, and it was not until his seventieth year that (with the exception of a brief tract on the *De Inconsumis* of Hippocrates) he felt that any of them were sufficiently complete to be given to the world. In 1556 he printed his *Dialogue on the De Plantis* attributed to Aristotle, and in 1557 his *Exercitationes* on the work of Cardan, *De Subtilitate*. His other scientific works, *Commentaries* on Theophrastus's *History of Plants* and Aristotle's *History of Animals*, he left in a more or less unfinished state, and they were not printed until after his death. They are all marked by the same characteristics: arrogant dogmatism, violence of language, irritable vanity, a constant tendency to self-glorification, which we expect to find only in the chaff and the impostor, are in him combined with extensive real knowledge, with acute reasoning, with an observation of facts and details almost unparalleled. He displays everywhere what Naudé calls "an intellect teeming with heroic thought." But he is only the naturalist of his own time. That he anticipated in any manner the inductive philosophy cannot be contended, his botanical studies did not lead him, like his contemporary Gesner, to any idea of a natural system of classification, and he rejected with the utmost arrogance and violence of language the discoveries of Copernicus. In metaphysics and in natural history Aristotle was a law to him, and in medicine Galen, but he was not a slave to the text or the details of either. He has thoroughly mastered their principles, and is able to see when his masters are not true to themselves. He

corrects Aristotle by himself. He is in that stage of learning when the attempt is made to harmonize the written word with the actual facts of nature, and the result is that his works have no real scientific value. Their interest is only historical. His *Exercitationes* upon the *De Subtilitate* of Cardan (1557) is the book by which Scaliger is best known as a philosopher. Its numerous editions bear witness to its popularity, and until the final fall of Aristotle's physics it continued a popular text-book, as late as the middle of the seventeenth century an elaborate commentary upon it was published by Spering, a professor at Wittenberg. We are astonished at the encyclopedic wealth of knowledge which the *Exercitationes* display, at the vigour of the author's style, at the accuracy of his observations, but are obliged to agree with Naudé that he has committed more faults than he has discovered in Cardan, and with Nisaid that his object seems to be to deny all that Cardan affirms and to affirm all that Cardan denies. Yet it is no light praise that writers like Leibnitz and Sir William Hamilton recognize J C Scaliger as the best modern exponent of the physics and metaphysics of Aristotle. He died at Agen 21st October 1558.

2 JOSEPH JUSTUS SCALIGER (1540-1609), the greatest scholar of modern times, was the tenth child and third son of Julius Cæsar Scalger and Andiette de la Roque Lobegac (see above). Born at Agen in 1540, he was sent when twelve years of age, with two younger brothers, to the college of Guenne at Boideaux, then under the direction of Jean Gélida. An outbreak of the plague in 1555 caused the boys to return home, and for the next few years Joseph was his father's constant companion and amanuensis. The composition of Latin verse was the chief amusement of Julius in his later years, and he daily dictated to his son from eighty to a hundred lines, and sometimes more. Joseph was also required each day to write a Latin theme or declamation, but in other respects he seems to have been left to his own devices. The Latin verse of Julius, faulty as it is in all that constitutes poetry, yet displays a more extensive knowledge of the Latin language, and a greater command of its resources, than is to be found in the verse of any of his contemporaries, and this constant practice in writing and reading or speaking Latin, under the supervision of one who knew the language thoroughly, was probably the foundation of Joseph's Latin scholarship. But the companionship of his father was worth more to him than any mere instruction. He learned from Julius what real knowledge was, and that it did not consist in discussions on words and phrases; and to his father he owed it that he was not a mere scholar, but something more—an acute observer, never losing sight of the actual world, and aiming not so much at correcting texts as at laying the foundation of a science of historical criticism.

In 1558, on the death of his father, he proceeded to Paris, and spent four years at the university there. Of his life at Paris we know but little. Hitherto he had not studied Greek. Now he felt that not to know Greek was to know nothing. It was in the literature of Greece that he must look for the true key of antiquity, and he forthwith began to attend the lectures of Turnebus. But after two months he found out his mistake. He had much to learn before he could be in a position to profit by the lectures of the greatest Greek scholar of the time. He shut himself up in his chamber, and determined to teach himself. He read Homer in twenty-one days, and then went through all the other Greek poets, orators, and historians, forming a grammar for himself as he went along. From Greek, at the suggestion of Postal, he proceeded to attack Hebrew, and then Arabic, of both he acquired a respectable knowledge, though not the critical mastery which he

possessed in Latin and Greek. The name of Domt then stood as high as that of Tulleus as a Greek scholar, and far higher as a professor. He has left nothing to justify his reputation as a scholar, but as a teacher he undoubtedly possessed the highest qualifications. He was able not only to impart knowledge, but to kindle enthusiasm for his subject in the minds of his hearers and pupils. It was to Dorat that Scaliger owed the home which he found for the next thirty years of his life. In 1563 the professor recommended him to Louis de Chastaigner, the young lord of La Roche Pozay, as a companion in his travels. A close friendship sprang up between the two young men, which remained unbroken till the death of Louis in 1595. The travellers first proceeded to Rome. Here they found Muretus, who, when at Bordeaux and Toulouse, had been a great favourite and occasional visitor of Julius Caesar at Agen. Muretus soon recognized Scaliger's merits, and devoted himself to making his stay at Rome as agreeable as possible, introducing him to all the men that were worth knowing. After visiting a large part of Italy, the travellers passed to England and Scotland, taking as it would seem La Roche Pozay on their way, for Scaliger's preface to his first book, the *Conjectanea in Varonem*, is dated there in December 1564. Scaliger formed an unfavourable opinion of the English. Their inhuman disposition, and inhospitable treatment of foreigners, especially impressed him. He was also disappointed in finding few Greek manuscripts and few learned men. It was not until a much later period that he became intimate with Richard Thompson and other Englishmen. In the course of his travels he had become a Protestant. His father, though he lived and died in the communion of the Church of Rome, had been suspected of heresy, and it is probable that Joseph's sympathies were early enlisted on the side of Protestantism. On his return to France he spent three years with the Chastaigners, accompanying them to their different chateaux in Poitou, as the calls of the civil war required their presence. In 1570 he accepted the invitation of Cuyas, and proceeded to Valence to study jurisprudence under the greatest living jurist. Here he remained three years, profiting not only by the lectures but even more by the library of Cuyas, which filled no less than seven or eight rooms and included five hundred manuscripts.

The massacre of St Bartholomew—occurring as he was about to accompany the bishop of Valence on an embassy to Poland—induced him with other Huguenots to retire to Geneva, where he was received with open arms, and was appointed a professor in the academy. He lectured on the *Organon* of Aristotle and the *De Finibus* of Cicero with much satisfaction to the students but with little to himself. He hated lecturing, and was bored to death with the importunities of the fanatical preachers, and in 1574 he returned to France, and made his home for the next twenty years in the chateaux of his friend the lord of La Roche Pozay. Of his life during this period we have for the first time interesting details and notices in the *Lettres françaises inédites de Joseph Scaliger*, edited by M. Tamizey de Larroque (Agen, 1881), a volume which adds much to our knowledge of Scaliger's life. Constantly moving from chateau to chateau through Poitou and the Limousin, as the exigencies of the civil war required, occasionally taking his turn as a guard when the chateau was attacked, at least on one occasion trailing a pike on an expedition against the Leaguers, with no access to libraries, and frequently separated even from his own books, his life during this period seems in one aspect most unsuited to study. He had, however, what so few contemporary scholars possessed—leisure, and freedom from pecuniary

cares. In general he could devote his whole time to study, and it was during this period of his life that he composed and published the books which showed how far he was in advance of all his contemporaries as a scholar and a critic, and that with him a new school of historical criticism had arisen. His editions of the *Catalecta* (1574), of Festus (1576), of Catullus, Tibullus, and Propertius (1577), are the work of a man who writes not only books of instruction for learners, but who is determined himself to discover and communicate to others the real meaning and force of his author. Discarding the trivial remarks and groundless suggestions which we find in the editions of nearly all his contemporaries and predecessors, he first laid down and applied sound rules of criticism and emendation, and changed textual criticism, from a series of haphazard and frequently baseless guesses, into a "rational procedure subject to fixed laws" (Pattison). But these works, while proving Scaliger's right to the foremost place among his contemporaries as far as Latin scholarship and criticism were concerned, did not go beyond mere scholarship. It was reserved for his edition of Manilius (1579), and his *De Emendatione Temporum* (1583), to revolutionize all the received ideas of the chronology of ancient history,—to show for the first time that ancient chronology was of the highest importance as a corrector as well as a supplement to historical narrative, that ancient history is not confined to that of the Greeks and Romans, but also comprises that of the Persians, the Babylonians, and the Egyptians, hitherto neglected as absolutely worthless, and that of the Jews, hitherto treated as a thing apart and too sacred to be mixed up with the others, and that the historical narratives and fragments of each of these, and their several systems of chronology, must be carefully and critically compared together, if any true and general conclusions on ancient history are to be arrived at. It is this which constitutes his true glory, and which places Scaliger on so immeasurably higher an eminence than any of his contemporaries. Yet, while the scholars of his time admitted his pre-eminence, neither they nor those who immediately followed seem to have appreciated his real merit, but to have considered his emendatory criticism, and his skill in Greek, as constituting his claim to special greatness. "Scaliger's great works in historical criticism had overstepped any power of appreciation which the succeeding age possessed" (Pattison). His commentary on Manilius is really a treatise on the astronomy of the ancients, and it forms an introduction to the *De Emendatione Temporum*, in which he examines by the light of modern and Copernican science the ancient system as applied to epochs, calendars, and computations of time, showing upon what principles they were based.

In the remaining twenty-four years of his life he at once corrected and enlarged the basis which he had laid in the *De Emendatione*. With incredible patience, sometimes with a happy audacity of conjecture which itself is almost genius, he succeeded in reconstructing the lost *Chronicle* of Eusebius—one of the most precious remains of antiquity, and of the highest value for ancient chronology. This he printed in 1606 in his *Thesaurus Temporum*, in which he collected, restored, and arranged every chronological relic extant in Greek or Latin. In 1590 Lipsius retired from Leyden, where for twelve years he had been professor of Roman history and antiquities. The university and its protectors, the states-general of Holland and the prince of Orange, resolved to obtain Scaliger as his successor. He declined their offer. He hated the thought of lecturing, and there were those among his friends who erroneously believed that with the success of Henry IV. learning would flourish, and

Protestantism be no bar to distinction and advancement. The invitation was renewed in the most gratifying and flattering manner a year later. Scaliger would not be required to lecture. The university only wished for his presence. He would be in all respects the master of his time. This offer Scaliger provisionally accepted. About the middle of 1593 he started for Holland, where he passed the remaining thirteen years of his life, never returning to France. His reception at Leyden was all that he could wish. A handsome income was assured to him. He was treated with the highest consideration. His rank as a prince of Verona was recognized. Placed midway between The Hague and Amsterdam, he was able to obtain, besides the learned circle of Leyden, the advantages of the best society of both these capitals. For Scaliger was no hermit buried among his books; he was fond of social intercourse with persons of merit and intelligence, and was himself a good talker.

For the first seven years of his residence at Leyden his reputation was at its highest point. His literary dictatorship was unquestioned. It was greater in kind and in extent than that of any man since the revival of letters—greater even than that of Erasmus had been. From his throne at Leyden he ruled the learned world, and a word from him could make or mar a rising reputation. The electric force of his genius drew to him all the rising talent of the republic. He was surrounded by young men eager to listen to and profit by his conversation, and he enjoyed nothing better than to discuss with them the books they were reading, and the men who wrote them, and to open up by his suggestive remarks the true methods and objects of philological and historical study. He encouraged Grotius when only a youth of sixteen to edit Capella, the early death of the younger Douza he wept as that of a beloved son, Daniel Heinsius, from being his favourite pupil, became his most intimate friend. But Scaliger had made numerous enemies. He hated ignorance, but he hated still more half learning, and most of all dishonesty in argument or in quotation. Himself the soul of honour and truthfulness, with a single aim in all his writings, namely, to arrive at the truth, he had no toleration for the disingenuous arguments, and the misstatements of facts, of those who wrote to support a theory or to defend an unsound cause. Neither in his conversation nor in his writings did he conceal his contempt for the ignorant and the dishonest. His pungent sarcasms were soon carried to the ears of the persons of whom they were uttered, and his pen was not less bitter than his tongue. He resembles his father in his arrogant tone towards those whom he despises and those whom he hates, and he despises and hates all who differ from him. He is conscious of his power as a literary dictator, and not always sufficiently cautious or sufficiently gentle in its exercise. Nor, it must be admitted, was Scaliger always right. He trusted much to his memory, which was occasionally treacherous. His emendations, if frequently happy, were sometimes absurd. In laying the foundations of a science of ancient chronology, he relied sometimes upon groundless, sometimes even upon absurd hypotheses, frequently upon an imperfect induction of facts. Sometimes he misunderstood the astronomical science of the ancients, sometimes that of Copernicus and Tycho Brahe. And he was no mathematician. But his enemies were not merely those whose errors he had exposed, and whose hostility he had excited by the violence of his language. The results of his system of historical criticism had been adverse to the Catholic controversialists, and to the authenticity of many of the documents upon which they had been accustomed to rely. The Jesuits, who aspired to be the expounders of antiquity, the source of all

scholarship and criticism, perceived that the writings and authority of Scaliger were the most formidable barrier to their claims. It was the day of conversions. Muretus in the latter part of his life professed the strictest orthodoxy, Lipsius had been reconciled to the Church of Rome; Casaubon was supposed to be wavering, but Scaliger was known to be hopeless, and as long as his supremacy was unquestioned the Protestants had the victory in learning and scholarship. A determined attempt must be made, if not to answer his criticisms, or to disprove his statements, yet to attack him as a man, and to destroy his reputation. This was no easy task, for his moral character was absolutely spotless.

After several scurrilous attacks by the Jesuit party, in which coarseness and violence were more conspicuous than ability, in 1607 a new and more successful attempt was made. Scaliger's weak point was his pride. Brought up by his father, whom he greatly revered, in the belief that he was a prince of Verona, he never forgot this himself, nor suffered it to be forgotten by others. Naturally truthful, honourable, and virtuous in every respect, he conceived himself especially bound to be so on account of his illustrious ancestry. In 1594, in an evil hour for his happiness and his reputation, he published his *Epistola de Vetustate et Splendore Gentis Scaligeræ et J. C. Scaligeri Vita*. In 1607 Gaspar Scoppius, then in the service of the Jesuits, whom he afterwards so bitterly labelled, published his *Scaliger Hypobolismus* ("The Supposititious Scaliger"), a quarto volume of more than four hundred pages, written with consummate ability, in an admirable and incisive style, with the entire disregard for truth which Scoppius always displayed, and with all the power of that sarcasm in which he was an accomplished master. Every piece of gossip or scandal which could be raked together respecting Scaliger or his family is to be found there. The author professes to point out five hundred lies in the *Epistola de Vetustate* of Scaliger, but the main argument of the book is to show the falsity of his pretensions to be of the family of La Scala, and of the narrative of his father's early life, and to hold up both father and son to contempt and ridicule as impudent impostors. "No stronger proof," says Mr. Pattison, "can be given of the impressions produced by this powerful philippic, dedicated to the defamation of an individual, than that it has been the source from which the biography of Scaliger, as it now stands in our biographical collections, has mainly flowed." To Scaliger the blow was crushing. Whatever the case as to Julius, Joseph had undoubtedly believed himself a prince of Verona, and in his *Epistola* had put forth with the most perfect good faith, and without inquiry, all that he had heard from his father as to his family and the early life of Julius. It was this good faith that laid the way for his humiliation. His *Epistola* is full of blunders and mistakes of fact, and, relying partly on his own memory partly on his father's good faith, he has not verified one of the statements of Julius, most of which, to speak most favourably, are characterized by rhodomontade, exaggeration, or inaccuracy. He immediately wrote a reply to Scoppius, entitled *Confutatio Fabule Burdonum*. It is written, for Scaliger, with unusual moderation and good taste, but perhaps for that very reason had not the success which its author wished and even expected. In the opinion of the highest and most competent authority, Mr. Pattison, "as a refutation of Scoppius it is most complete", but there are certainly grounds for dissenting, though, with diffidence, from this judgment. Scaliger undoubtedly shows that Scoppius has committed more blunders than he has corrected, that his book literally bristles with pure lies and baseless calumnies, but he does not succeed in

adducing a single proof either of his father's descent from the La Scala family, or of any single event narrated by Julius as happening to himself or any member of his family prior to his arrival at Agen. Nor does he even attempt a refutation of what seems really to be the crucial point in the whole controversy, and which Scoppius had proved, as far as a negative can be proved,—namely, that William, the last prince of Verona, had no son Nicholas, the alleged grandfather of Julius, nor indeed any son who could have been such grandfather. But whether complete or not, the *Confutatio* had no success, the attack of the Jesuits was successful, far more so than they could possibly have hoped. Scoppius was wont to boast that his book had killed Scaliger. It certainly embittered the few remaining months of his life, and it is not improbable that the mortification which he suffered may have shortened his days. The *Confutatio* was his last work. Five months after it appeared, "on the 21st of January, 1609, at four in the morning, he fell asleep in Heinsius's arms. The aspiring spirit ascended before the Infinite. The most richly stored intellect which had ever spent itself in acquiring knowledge was in the presence of the Omniscient" (Pattison).

Of Joseph Scaliger the only biography in any way adequate is that of Jacob Bernays (Berlin, 1865). It was reviewed by the late Mark Pattison in an excellent article in the *Quarterly Review*, vol. cxxv (1866). Mr. Pattison had made many MS. collections for the life of Joseph Scaliger on a much more extensive scale, which it is greatly to be regretted he left unfinished, and in too fragmentary a state to be published. The present writer has had access to and made much use of these MSS., which include a life of Julius Caesar Scaliger written some years since. For the life of Joseph, besides the recently published letters above referred to, the two old collections of Latin and French letters and the two *Scaligerana* are the most important sources of information. For the life of Julius Caesar the letters edited by his son, those subsequently published in 1620 by the President de Manssac, the *Scaligerana*, and his own writings, which are full of autobiographical matter, are the chief authorities. M. De Boursoude de Lafosse's *Étude sur Jules César de Lescage* (Agen, 1860) and M. Magen's *Documents sur Julius César Scaliger et sa famille* (Agen, 1878) add important details for the lives of both father and son. The lives by M. Charles Nisard—first of Julius in *Les Gladiateurs de la République des Lettres*, and that of Joseph in *Le Triumvirat Littéraire au seizième siècle*—are equally unworthy of their author and their subjects. Julius is simply held up to ridicule, while the life of Joseph is almost wholly based on the book of Scoppius and the *Scaligerana*. A complete list of the works of Joseph will be found in his life by Bernays. (R C C.)

SCAMMONY. Under this name the dried juice of the root of *Convolvulus Scammonia*, L. (*σκάμνωλα*), is used in medicine.¹ It appears to have been known to the Greeks as early as the 3d century B.C., and is supposed to have been one of the medicines recommended to Alfred the Great by Helias, patriarch of Jerusalem (*Cockayne Leechdoms*, vol. i. pp. xxiv, 289, 175, 273, 281). The scammony plant is a native of the countries of the eastern part of the Mediterranean basin, growing in bushy waste places, from Syria in the south to the Crimea in the north, its range extending westward to the Greek islands, but not to northern Africa or Italy. It is a twining perennial, bearing flowers like those of *Convolvulus arvensis*, and having irregularly arrow-shaped leaves and a thick fleshy root. The drug is collected principally in Asia Minor, and near Aleppo in Syria, although a little is obtained from the neighbourhood of Mount Carmel and the Lake of Tiberias. The principal places of export are Smyrna and Aleppo (Scanderoun), but the drug often bears in commerce the name of the district where it was collected, e.g., Broussa, Angora, &c. Formerly Aleppo scammony was considered the best and commanded the highest price, but at present the purest article comes from Smyrna. The very variable quality of the drug has led to the use of the resin prepared directly from the root, which affords it to the extent of 5½

per cent, and an establishment for its manufacture was founded at Broussa in 1870. The dried root is also exported to England, and the resin prepared from it there. By purification the resin can be obtained almost white. The crude resin obtained from the root, being free from gum, does not present a milky appearance when rubbed with a wetted finger, and is thus easily distinguished from the natural product.

Scammony is used in medicine as a safe but energetic purgative, and is frequently prescribed in combination with calomel and colocynth. Its medicinal activity is due to the resin scammonin, which is also called jalapin from its occurrence in the root of the male jalap (*Ipomoea orizabensis*), and of Tampico jalap (*I. simulans*) (see JALAP). The export of scammony from Smyrna in 1881 was only 97 boxes, valued at £544, the amount having decreased of late years owing to the increased export of the root from Syria. More than half of this quantity was taken by England, about one-fourth by France, and the remainder by Italy, America, and Austria.

The drug is obtained from the root by slicing off obliquely one or two inches from the crown and allowing the milky juice which exudes to drain into a small shell (generally that of a freshwater mussel), which is inserted in the wound just below the point of the incision. To prevent the juice from becoming soiled, the earth is scraped away so as to leave exposed four or five inches of the root. The shells are collected in the evening and their contents emptied into a copper or leather vessel,—the scrapings from the surface of the root, consisting of partially dried tears, being added. On the average, about one drachm is afforded by each incision, a plant four years old may give two drachms, in rare cases as much as twelve drachms has been obtained from a single large root. The collection usually takes place when the plant is in flower towards the end of summer. The product of different roots naturally varies in quality, and the peasants therefore, on arrival at their homes, render it uniform by mixing it with a knife. It is then spread out in the sun to dry. Sometimes the gathering of several days is allowed to accumulate, then moistened, kneaded, and made up into cakes. During the drying it appears to undergo a kind of fermentation, which gives the drug a slightly porous appearance and dark colour. Frequently it is adulterated by adding 40 per cent of flour and earthy matter. It then assumes a paler colour and opaque appearance, and loses its bitterness. This adulterated article is known as "skilip," and the pure article as "virgin" scammony. The latter is met with in the form of flattened pieces half an inch or more in thickness, with a blackish, resinous fracture, thin fragments being translucent. Externally it is often covered with a greyish powder. The odour, when a piece is freshly broken, is cheesy, when chewed, it leaves an acrid sensation in the throat. Scammony of good quality should yield to ether 80 to 90 per cent. of resin, the remainder consists of gum and mineral matter.

SCANDERBEG, *ve*, Iskander (Alexander) Bey, is the Turkish name and title of GEORGE CASTRIOTA, the youngest son of John Castriota, lord of an hereditary principality in Albania. He was born about the year 1404, and as a boy was sent as a hostage to the Ottoman court, where he was brought up as a Mohammedan for the Turkish military service. He early distinguished himself as a soldier and received high promotion under Amurath II. In 1443 he was of the expedition against the Magyars, but shortly after taking the field he heard of his father's death and resolved to strike a blow for freedom. Availing himself of the opportunity afforded by John Hunyadi's defeat of the Turks at Nish, he forced from the principal secretary of the sultan a firman making him governor of Croja, his native town, and forthwith left the camp with 300 Albanian horsemen. Once master of the place, he abjured Islam and proclaimed his independence. The Albanians soon recognized him as their head, and flocked to his standard, and pasha after pasha was vainly sent to crush him. Amurath II. in person unsuccessfully besieged him in 1450, and Mohammed II. found it necessary to grant him favourable terms of peace in 1461. Instigated by the legates of Pius II. and the ambassadors of the Venetian republic, Scanderbeg again proclaimed war in 1464, and at least was successful in repelling the

¹ It was formerly called diagyrdion, probably from *δαγρυ*, a tear, in allusion to the manner the juice exudes from the incised root.

sultan, who had invaded Albania. He died in January 1467 at Alessio, leaving an infant son named John, whom he commended to the care of the Venetians. After a twelve years' war, the Turks finally gained possession of Croya, the representatives of Scanderbeg settling in Calabria.

SCANDEROON (ISCANDERX), or ALEXANDRETTA, lies girdled by green hills on the picturesque bay of the same name, the ancient *Sinus Issus*, at the extreme north of the Syrian coast, where it forms an angle with that of Asia Minor. Alexandretta succeeded an older town of Alexandria (Little Alexandria), founded by Alexander the Great, but does not perhaps occupy quite the same site. The harbour is the best on the Syrian coast, and steamers call at it regularly, but the town is scourged with fever and has only some 2500 inhabitants, mainly Greek Christians. It is the port of Aleppo, and would naturally be the port of an "Euphrates railway".

SCANDINAVIAN LANGUAGES. By this expression we understand the closely allied languages which are and have been spoken by the Germanic population in Scandinavia, and by the inhabitants of the countries that have been wholly or partially peopled from it. At present the territory of these languages embraces—Sweden, except the most northerly part (Lapland and inland parts of Vesterbotten, where Finnish and Lappish exclusively or chiefly prevail), certain islands and districts on the coast of western and southern Finland, as well as Åland;¹ a small tract on the coast of Estonia, where Swedish is spoken, as it is also to some extent in the Estonian islands of Dago, Nargo, Nukko, Ormsö, and Rågo;² Gammalsvenskby ("Galsvenska") in southern Russia (government of Kherson);³ a village colonized from Dago, the Livonian island of Luno, where Swedish is spoken, as it formerly was on the island of Osel, Norway, except certain regions in the northern part of the country, peopled by Finns and Lapps (diocese of Tromsø), Denmark, with the Faroes, Iceland, and Greenland, where, however, Danish is only spoken by a very small part of the population, the northernmost part of Schleswig, and, finally, several Scandinavian colonies in the United States of North America. Scandinavian dialects have besides been spoken for varying periods in the following places: Norwegian in certain parts of Ireland (800–1300 A.D.) and northern Scotland, in the Isle of Man, the Hebrides (800–1400, or longer), the Shetland Islands (800–1800), and the Orkneys (800–1800);⁴ Danish in the whole of Schleswig, in the north-eastern part of England (the "Danelag"), and in Normandy (900–1000, or a little longer);⁵ Swedish in Russia (from the end of the 9th to the beginning of the 11th century).⁶ At what epoch the Germanic population settled in Scandinavia we cannot as yet even approximately decide. It is quite certain, however, that it already existed there before the Christian era,—nay, most probably as early as the beginning of the so-called Stone Age (three thousand years before Christ).

If this view be correct, the Scandinavian languages have had an existence of more than four thousand years.⁸ But we do not know anything about them during the period before the birth of Christ. It is only from that epoch we can get any information concerning the language of the old Scandinavians, which seems by that time not only to have spread over Denmark and great parts of southern and middle Sweden and of (southern) Norway, but also to have reached Finland (at least Nyländ) and Esthonia. In spite of its extension over this considerable geographical area, the language appears to have been fairly homogeneous throughout the whole territory. Consequently, it may be regarded as a uniform language, the mother of the younger Scandinavian tongues, and accordingly has been named the primitive Scandinavian (*ur-nordisk*) language. The oldest sources of our knowledge of this tongue are the words which were borrowed during the first centuries of the Christian era (some of them perhaps even earlier) by the Lapps from the inhabitants of central Sweden and Norway, and by the Finns from their neighbours in Finland and Esthonia, and which have been preserved in Finnish and Lappish down to our own days.⁹ These borrowed words, denoting chiefly utensils belonging to a fairly advanced state of culture, words amount to several hundreds, with a phonetic form of a very primitive stamp, as Finn *terva* (O. Sw. *tierra*, Germ. *ther*), tar, *avo* (O. Sw. *oar*); *kansa* (O. H. G. *hansa*), people, *nagatava* (O. H. G. *nabagō*, O. Sw. *navar*), auger, *neila* (Got. *nēpla*, O. Sw. *na!*), needle, *ansas* (Got. *ans*, O. Sw. *as*), beam, *Lapp asar* (Got. *asan*, O. Sw. *as*), saw; *garves* (O. H. G. *garwe*, O. Sw. *ger*), finished; *dieres* (O. Sax. *dura*, O. Sw. *dyr*), dear, *sauvo* (O. H. G. *seifa*, Sw. *äpa*), soap. These words, with those mentioned by contemporary Roman and Greek authors, are the oldest existing traces of any Germanic language. Viewed from their context, however, they throw but little light on the nature of the original northern tongue. But a series of linguistic monuments have come down to us dating from the end of the so-called early Iron Age (about 450 A.D.),—the knowledge and the use of the oldest runic alphabet (with twenty-four characters) having at that period been propagated among the Scandinavians by the southern Germanic tribes. In fact we still possess, preserved down to our own times, primitive northern runic inscriptions, the oldest upon the utensils found at *Thorshög*, dating back to about 300 A.D.¹⁰ which, together with the MS. fragments of Ulfilas's Gothic translation of the Bible, about two hundred years later in date, constitute the oldest veritable monuments of any Germanic tongue. These runic inscriptions are for the most part found on stone-monuments (sometimes on rocks) and bractates (gold coins stamped on one side and used for ornaments), as well as on metallic and wooden utensils, weapons, and ornaments.¹¹ Up to this time there have been discovered more than one hundred, but of these only about one-half give us any information concerning the language, and most of them are only too short. The longest one, the stone-monument of *Tune*, in south-eastern Norway, contains only sixteen words. Their language is somewhat later in character than that of the oldest words borrowed by the Lapps and Finns, accented *ä*, for example, is already changed into *α* (cf. *marin* = Goth. *mēr*, renowned, but the Finn borrowed word *nēila* = Goth. *nēpla*, needle), and the voiced *s* into a kind of *r* (cf. *dagax* = Goth. *dags*,

day, but Finn *amns* = Goth *amns*, poor). On the other hand, in all essential matters it is much earlier in character than the language of contemporary Gothic manuscripts, and no doubt approaches more nearly than any Germanic idiom the primitive form of the Germanic tongue. For the sake of comparison, we give a Gothic translation of one of the oldest of the primitive Scandinavian inscriptions, that on the golden horn of *Gallehus*, found on the Danish-German frontier, and dating from about 400 A.D. —

Scand. EK HLEWAGASTIR HOLTIGAR HONKA TAWIDO,
Goth. *u. hlewagastis holtis hruna bairda*,
Engl. I, Hlewagastir, son of Holta, made the horn,

as well as the inscription on the stone-monument of *Jasberg* in western Sweden, which is at least a hundred years later —

Scand. TUBA HITE HARABANA R WIT JAN EK ERILA R BENO R
WANTU,
Goth. *ufas hita, hwabns wit jah, u. erila r bade urist*,
Engl. In memory of Hitar. We both, Haraban and I Erlar,
wrote the runes

Although very brief, and not yet thoroughly interpreted,¹ these primitive Scandinavian inscriptions are nevertheless sufficient to enable us to determine with some certainty the relation which the language in which they are written bears to other languages. Thus it is proved that it belongs to the Germanic family of the Indo-European stock of languages, of which it constitutes an independent and individual branch. Its nearest relation being the Gothic, these two branches are sometimes taken together under the general denomination *Eastern Germanic*, as opposed to the other Germanic idioms (German, English, Dutch, &c.), which are then called *Western Germanic*. The most essential point of correspondence between the Gothic and Scandinavian branches is the insertion in certain cases of *gg* before *u* and *j* (*ggj* in Gothic was changed into *ddj*), as in gen. plur. O. H. G. *uerno*, O. Engl. *twæga* (two), compared with O. Iscl. O. Norw. *twæga*, O. Sw. O. Dan. *træga*, Goth. *twaddjê*, and, still, in Germ. *træu*, Engl. *tree*, compared with Sw. Norw. Dan. *trægg*, Iscl. *trægg*, Goth. *trægg*. However, even in the primitive Scandinavian age the difference between Gothic and Scandinavian is more clearly marked than the resemblance, thus, for example — just to hint only at some of the oldest and most essential differences — Goth. nom. sing. ending in *-s* corresponds to primitive Scandinavian *-ar*, *-a* (as Goth. *dagis*, day; *gasts*, guest = Scand. *dagar*, *gastir*), Goth. gen. sing. in *-is* to Scand. *-as* (as Goth. *dagis*, day's = Scand. *dagas*), Goth. dat. sing. in *-a* to Scand. *-e* (as Goth. *hwarina*, coin = Scand. *lurne*), Goth. 1st pers. sing. pres. in *-do* to Scand. *-do* (as Goth. *tawido*, did = Scand. *tawido*).

As early as the beginning of the so-called later Iron Age (about 700 A.D.) the primitive Scandinavian language had undergone a considerable transformation, as is proved for example by the remarkable runic stone at *Isäby* in the south of Sweden, with the inscription —

AFTR HARUWULAFR HAPUWULAFR HAREUWULAFR WAPRAIT
RUNA R PAIAZ,
Engl. In memory of Haruwlaf, Hapuwlaf, son of Hæruwlaf,
wrote these runes

Here, e.g., we find nom. sing. in *-ar* changed into *-r* (cf. *hapuwlafar* with *hötungar* on the golden horn), and the plural ending *-ar* into *-ar* (cf. *runar* with *runar* on the Jarsberg-stone). At the beginning of the so-called Viking Period (about 800 A.D.) the Scandinavian language seems to have undergone an extraordinarily rapid development, which in a comparatively short time almost completely

transformed its character. This change is especially noticeable in the dropping of unaccented vowels, and in the introduction of a certain vowel harmony of different kinds ("Umlaut", vowel changes, caused by a following *i* (*j*) or *u* (*ø*), as *Lædi* for *læði*, poem, and "Brechung", as *helpa* instead of *helpa*, to help), different assimilations of consonants (as *ll*, *nn* for *lp*, *np*, *ll*, *nn*, *rr*, and *ss* for *ln*, *mn*, *rn*, and *sn*), dropping of *u* before *a* and *u* (as *orð*, *uflr* for *uorð*, word, *uoflr*, wolf), simplified inflexion of the verbs, a new passive formed by means of affixing the reflexive pronoun *sik* to the active form (as *lallu-sik*, to call one's self, to be called), &c.

At this epoch, therefore, the primitive Scandinavian language must be considered as no longer existing. The next two centuries form a period of transition as regards the language as well as the alphabet which it employed. We possess some inscriptions belonging to this period in which the old runic alphabet of twenty-four characters is still used, and the language of which closely resembles that of the primitive Scandinavian monuments, as, for example, those on the stones of *Stengeten* and *Björkatorp*, both from southern Sweden, probably dating from the 10th century, and being the longest inscriptions yet found with the old runic alphabet. On the other hand, inscriptions have come down to us dating from about the middle of the 9th century, in which the later and exclusively Scandinavian alphabet of sixteen characters has almost completely superseded the earlier alphabet, from which it was developed, while the language not only differs widely from the original Scandinavian, but also exhibits dialectal peculiarities suggesting the existence of a Danish-Swedish language as opposed to Norwegian, as the form *Dælets* *runf* on the stone at *Flenlose* in Denmark, which is a Norwegian inscription would have been written *hrunf* corresponding to *hröf* in Old Norwegian literature. These differences, however, are unimportant, and the Scandinavians still considered their language as one and the same throughout Scandinavia, and named it *Dönsk tunga*, Danish tongue. But when Iceland was colonized at the end of the 9th and the beginning of the 10th century, chiefly from western Norway, a separate (western) Norwegian dialect gradually sprang up, at first of course only differing slightly from the mother-tongue. It was not until the introduction of Christianity (about 1000 A.D.) that the language was so far differentiated as to enable us to distinguish, in runic inscriptions and in the literature which was then arising, four different dialects, which have ever since existed as the four literary languages — Icelandic, Norwegian, Swedish, and Danish. Of these the latter two, often comprehended within the name of *Eastern Scandinavian*, as well as the former two, *Western Scandinavian*, or, to use the Old Scandinavians' own name, *Norrønt mál*, Northern tongue, are very nearly related to each other. The most important differences between the two branches, as seen in the oldest preserved documents, are the following — (1) In E. Scand. far fewer cases of "Umlaut" than in W. Scand. *væra*, were, *land*, W. Scand. *land* (from *landis*), lands, (2) E. Scand. "Brechung" *u* into *iu* (or *ø*) before *ng* (*u*), *nk* (*u*), as *svunga*, W. Scand. *svungva* (from *sungva*), to sing, (3) in E. Scand. *mp*, *nk*, *nt* are in many cases not assimilated into *pp*, *kk*, *tt*, as *krumpe*, W. Scand. *kröppenn*, shrunken; *enka*, W. Scand. *ekja*, widow, *bant*, W. Scand. *bath*, be bound; (4) in E. Scand. the dative of the definite plural ends in *-omen* instead of W. Scand. *-onum*, as in *hardonnen*, *hædonum*, (to) the hands, (5) in E. Scand. the simplification of the verbal inflexional endings is far further advanced, and the passive ends in *-s* for *-st*, as in *kallus*, W. Scand. *kallast*, to be called. In view of these points, and indeed generally speaking, the Western Scandinavian languages have preserved the more primitive forms, as may be seen in the

¹ For the interpretations we are generally indebted to Prof. S. Bugge's ingenious investigations, who in 1885 satisfactorily succeeded in deciphering the inscription of the golden horn, and by this means gained a fixed starting-point for further researches. A short review of their most important results is given by F. Burg, *Die älteren Nordischen Runenschriften*, 1885.

the lan-
guage

changes in Modern Icelandic we may note the following – already around the year 1550 the passive termination -*d* (-*sst*) passes into the *till* then very rare termination -*d* (as in *Lallast*, to be called), *y*, *g*, and *ö* at the beginning of the 17th century coexisted with *a*, *i*, *e*, and *o*, the long vowels *a*, *ä*, and *o* have passed into the diphthongs *ei*, *ai*, and *oi*; the vowel *u* has been replaced by *ú* in all languages, *mæla*, to speak, *still*, chair; *g* before *e* is changed into *gi* (after a consonant) or *j* (after a vowel), e.g., *bogur*, to love, *to*, *eiga*, not, in certain other cases *g* has passed into *gu* or *guo* or *-g*, e.g., *ljuga*, low, *ljúga*, to lie, *umtál* *g* before *n* is silent, e.g., *þagna*, to grieve, *kva* has passed into *höfna*, as in *höfnir*, to be angry, *þing*, law, *þinga*, to legislate, as also as *by*, *ðr*, *gl*, and *ti*, i.e. *v* now in most positions (not, however, before *ð*, *t*, and *s*, and in abbreviated names) as *dill*, *dala*, as fallow, *mottun*, *hyn*, bear; *f* before *eo* is now pronounced as *þ*, as *höfuð*, head, etc. Both in vocabulary and syntax we find early, e.g., in the lawbook *Jónsbók*, printed in 1578–90, Danish evenness of construction, and the influence of Latin, which was especially in circumstances in the 18th century, however, we meet with purist tendencies. As one of the leading men of this century may be mentioned the poet Eggert Jónsson (1718?), whose poems were not printed till 1892. Worthy of mention in the history of Modern Icelandic language are the learned societies which were founded in 1692, the *Vísindafélag* and the *Bókmenntafélag*. The first of “*Hitt öðmála*,” was established in 1790. At this time archaic tendencies, going back to the Old Icelandic of the 13th and 14th centuries, were continually gaining ground in our country; these findings have won especial renown in Icelandic literature. Þráinn Þórsmann (1781), Iceland’s greatest lyric poet, and Jóhanna Þórunn (1784), perhaps its most prominent pro-author in noble tongue.

Dialects

The dialectal differences in Modern Icelandic are comparatively trifling and chiefly phonetic. The Westland dialect has, for example, preserved the Old Icelandic long *a*, while the other dialects have changed it to the diphthong *au*, in the Northland dialect initial *h* is preserved, in the others changed into *hn*, in the northern and western parts of the island Old Icelandic *h* appears as *hv*, in a part of south-eastern Iceland as *x*, in the other dialects as *xi*, — *g*, *hægn*, *hælp*. As a matter of curiosity it may be noted that on the western and eastern coasts traces are found of a French-Icelandic language, which arose from the long sojourn of French fishermen there.

Gram-
matical
treat-
ment.

Owing to the exclusive interest taken in the ancient language, but little attention is given even now to the grammatical treatment of Modern Icelandic. Some notices of the language of the 17th century may be obtained from the above-mentioned grammar of Ruelhous Jones (1661), and for the language of the 16th from Revé's grammatical works. For the language of the 15th century see Harding's *Grammatica Islandica*, and for the 14th see his *Grammatica Islandica*. In 1861, also, *Sigfríður Arnarson* wrote his *Islandsk málfræðing hugmynda*, 1864, which, however, as not especially devoted to the modern state of philology, compare also B. Magnússon (Olsen's valuable paper "Zur neuisländischen Grammatik," *Germania*, xxvi, 1882). A dictionary of merit was that of Björn Hallgrósson (1794), edited in 1814 by Rask. Cleasby-Vigfusson's dictionary mentioned above also pays some attention to the modern language. A really competent Modern Icelandic grammar is not yet published, the Danish-Icelandic *Dansk-isländskt ordbog* by K. Gjelssel's excellent Danish-Icelandic *Dansk-isländskt ordbog* by K. Gjelssel, Copenhagen, 1851.

NOR-
WEGIAN
Old Nor
wegian

II NORWEGIAN OR NORSE.—The *Old Norwegian* language (till the Reformation) was not, like the modern language, confined to Norway and the Faïoes, but was, as already stated, for some time

spoken in parts of Ireland and the north of Scotland, the Isle of Man, the Hebrides, Shetland, and Orkney (in the last two groups of islands it continued to survive down to modern times), and also in certain parts of western Sweden as at present defined (Bohuslän, Sarna in Dalarna, Jamtland, and Härjedalen).

Our knowledge of it is due only in a small measure to runic Sources

inscriptions,¹ for these are comparatively few in number (a little more than one hundred) and of trifling importance from a philological point of view, especially as they almost wholly belong to the period between 1050 and 1350,² and consequently are contemporary with or at least not much earlier than the earliest of the Icelandic sagas. The earliest of the sagas are written in the alphabet. The earliest manuscripts are not much later than the oldest Old Icelandic ones, and of the greatest interest. On the whole, however, the earliest Norwegian literature is in quality as well as in quantity incomparably inferior to the Icelandic. It amounts merely to about a score of different works, and of these but few are of any literary value. A small fragment (Cod. Ar. 555, 40, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61, 62, 63, 64, 65, 66, 67, 68, 69, 70, 71, 72, 73, 74, 75, 76, 77, 78, 79, 80, 81, 82, 83, 84, 85, 86, 87, 88, 89, 90, 91, 92, 93, 94, 95, 96, 97, 98, 99, 100, 101, 102, 103, 104, 105, 106, 107, 108, 109, 110, 111, 112, 113, 114, 115, 116, 117, 118, 119, 120, 121, 122, 123, 124, 125, 126, 127, 128, 129, 130, 131, 132, 133, 134, 135, 136, 137, 138, 139, 140, 141, 142, 143, 144, 145, 146, 147, 148, 149, 150, 151, 152, 153, 154, 155, 156, 157, 158, 159, 160, 161, 162, 163, 164, 165, 166, 167, 168, 169, 170, 171, 172, 173, 174, 175, 176, 177, 178, 179, 180, 181, 182, 183, 184, 185, 186, 187, 188, 189, 190, 191, 192, 193, 194, 195, 196, 197, 198, 199, 200, 201, 202, 203, 204, 205, 206, 207, 208, 209, 210, 211, 212, 213, 214, 215, 216, 217, 218, 219, 220, 221, 222, 223, 224, 225, 226, 227, 228, 229, 230, 231, 232, 233, 234, 235, 236, 237, 238, 239, 240, 241, 242, 243, 244, 245, 246, 247, 248, 249, 250, 251, 252, 253, 254, 255, 256, 257, 258, 259, 260, 261, 262, 263, 264, 265, 266, 267, 268, 269, 270, 271, 272, 273, 274, 275, 276, 277, 278, 279, 280, 281, 282, 283, 284, 285, 286, 287, 288, 289, 290, 291, 292, 293, 294, 295, 296, 297, 298, 299, 300, 301, 302, 303, 304, 305, 306, 307, 308, 309, 310, 311, 312, 313, 314, 315, 316, 317, 318, 319, 320, 321, 322, 323, 324, 325, 326, 327, 328, 329, 330, 331, 332, 333, 334, 335, 336, 337, 338, 339, 340, 341, 342, 343, 344, 345, 346, 347, 348, 349, 350, 351, 352, 353, 354, 355, 356, 357, 358, 359, 360, 361, 362, 363, 364, 365, 366, 367, 368, 369, 370, 371, 372, 373, 374, 375, 376, 377, 378, 379, 380, 381, 382, 383, 384, 385, 386, 387, 388, 389, 390, 391, 392, 393, 394, 395, 396, 397, 398, 399, 400, 401, 402, 403, 404, 405, 406, 407, 408, 409, 410, 411, 412, 413, 414, 415, 416, 417, 418, 419, 420, 421, 422, 423, 424, 425, 426, 427, 428, 429, 430, 431, 432, 433, 434, 435, 436, 437, 438, 439, 440, 441, 442, 443, 444, 445, 446, 447, 448, 449, 450, 451, 452, 453, 454, 455, 456, 457, 458, 459, 460, 461, 462, 463, 464, 465, 466, 467, 468, 469, 470, 471, 472, 473, 474, 475, 476, 477, 478, 479, 480, 481, 482, 483, 484, 485, 486, 487, 488, 489, 490, 491, 492, 493, 494, 495, 496, 497, 498, 499, 500, 501, 502, 503, 504, 505, 506, 507, 508, 509, 510, 511, 512, 513, 514, 515, 516, 517, 518, 519, 520, 521, 522, 523, 524, 525, 526, 527, 528, 529, 530, 531, 532, 533, 534, 535, 536, 537, 538, 539, 540, 541, 542, 543, 544, 545, 546, 547, 548, 549, 550, 551, 552, 553, 554, 555, 556, 557, 558, 559, 560, 561, 562, 563, 564, 565, 566, 567, 568, 569, 570, 571, 572, 573, 574, 575, 576, 577, 578, 579, 580, 581, 582, 583, 584, 585, 586, 587, 588, 589, 590, 591, 592, 593, 594, 595, 596, 597, 598, 599, 600, 601, 602, 603, 604, 605, 606, 607, 608, 609, 610, 611, 612, 613, 614, 615, 616, 617, 618, 619, 620, 621, 622, 623, 624, 625, 626, 627, 628, 629, 630, 631, 632, 633, 634, 635, 636, 637, 638, 639, 640, 641, 642, 643, 644, 645, 646, 647, 648, 649, 650, 651, 652, 653, 654, 655, 656, 657, 658, 659, 660, 661, 662, 663, 664, 665, 666, 667, 668, 669, 670, 671, 672, 673, 674, 675, 676, 677, 678, 679, 680, 681, 682, 683, 684, 685, 686, 687, 688, 689, 690, 691, 692, 693, 694, 695, 696, 697, 698, 699, 700, 701, 702, 703, 704, 705, 706, 707, 708, 709, 710, 711, 712, 713, 714, 715, 716, 717, 718, 719, 720, 721, 722, 723, 724, 725, 726, 727, 728, 729, 730, 731, 732, 733, 734, 735, 736, 737, 738, 739, 740, 741, 742, 743, 744, 745, 746, 747, 748, 749, 750, 751, 752, 753, 754, 755, 756, 757, 758, 759, 760, 761, 762, 763, 764, 765, 766, 767, 768, 769, 770, 771, 772, 773, 774, 775, 776, 777, 778, 779, 780, 781, 782, 783, 784, 785, 786, 787, 788, 789, 790, 791, 792, 793, 794, 795, 796, 797, 798, 799, 800, 801, 802, 803, 804, 805, 806, 807, 808, 809, 8

After about 1250, it is regarded as the earliest extant manuscript of the literary beginning of the 13th century we have the *Norwegian* *Þingsögur* (Cod. AM 61b fol.) and the fragments of law-books, the older *Gulatingslöga* and the older *Drottningrögla*. The chief manuscript (Cod. AM 243B, fol.) of the principal work in Old Norwegian literature, the *Speculum Regale*, or *Könungsrögla* ("Mirror for Kings"), is a little later. Of still later manuscripts the so-called legendary *Glofninga* (Cod. Delag. 8, fol.), from about 1250, deserves mention. The masses of charters which—occurring throughout the whole Middle Age of Norway—from the beginning of the 13th century—afford much information, especially concerning the dialectal differences of the language, are likewise of great philological importance.

As in Old Icelandic so in Old Norwegian we do not find the most primitive forms in the oldest MSS that have come down to us, for that purpose we must recur to somewhat later ones, containing old poems from times as remote as those of the Bigger Doddecan (the beginning of the 11th century) and Þjóðskál of Eyvind (about the middle of the 12th). It is worthy to be noted that the language at the epoch differs so little from the present Scandinavian dialects that it could scarcely yet be called by a distinctive name, and also that, as Icelandic separated itself from the Norwegian mother-tongue (about 900), the difference between the two languages was at first infinitely small—less far, of course, as the literary language is concerned. From the 16th century, however, they exhibit more marked differences, for, while Icelandic develops to the present day, the Norwegian has been influenced by German and political circumstances, is considerably influenced by the Eastern Scandinavian languages. The most important differences between Icelandic and Norwegian at the epoch of the oldest MSS (about 1200) have already been noted. The tendency in Norwegian to retain the use of the so-called *u*-umlaut has already been mentioned. On the other hand, there appears in Norwegian in the 14th century some peculiarities which were unknown to Icelandic, the vowel terminations being in some degree influenced by the vowel of the preceding syllable. Thus, for instance, we find in some manuscripts (as the above-mentioned legendary *Olofs saga*) that the vowels *e*, *o* and long *a*, *s*, *g* are followed in terminations by *o*, *u*, *i*, *y*, and short *a*, *s*, *g*, on the other hand, by *u*, *y*, as in *bágn*, prayers, Korm, women, þús, tales, *tungur*, tongues. The same fact occurs in certain instances in the 15th century MSS. We may compare here what with Sweden under one crown (1319) we meet pure Suecisms in the Norwegian literary language. In addition to this, the 14th century exhibits several differences from the old languages; *r*, *n* are sometimes assimilated into *l*, *m*, as *kall* (older *karl*), man, *konn* (*korn*), corn, *prestanar* (*prestarnar*), the priests, *þ* passes into *y* before *r*, as *lyrdor* (*lyrdor*), shepherd, *lyfi* (*lyftir*), my final *u* changes into *y*, as *lyfingr* (*lyftingr*), books, the names *Pöllafræ* (*Pöllafræ*), *Göllumfræ* (*Göllumfræ*). About the beginning of the 16th century initial *lv* occurs for *lo* (*vot*), however, in pronouns, which take to *only* in western Norway, as the local name *Gvænaker* (*Kott*, white) During the 16th century, Norway being united with Denmark, and at intervals also with Sweden, came great numbers and a few Suecisms are introduced into the language, such as *gräsa* (*grass*), *minnition-u* of the 2d plural put instead of *-it*, *sv* (*sw*), you will, the pronoun *du* instead of *thú*. The most important Danish

⁴ *Ordbog over det Gamle Norske sprog*, 1862-67, new ed., 1883 sq.

⁵ See R. Arpl, "Islands yngre litteratur och språk" (*Språkvetenskapliga sällskapets förhandlingar*, 1888-85).

⁶ Notices of the Modern Icelandic pronunciation are also to be found in H. Sweet's *Handbook of Phonetics*, 1877, Chr. Vidsteen's *Oplysninger om Bygdemålene i Hordalene*, 1885, and R. Arni's above-quoted paper.

7 For these see especially Nicolaysen, *Nor-La fornleppningar*, 1862-66.

⁸ The oldest are those on the Valdeby (Larvik) and Strand (Asfjord) stones, both from pagan times. The latest rune-stones are from the end of the 14th century. Owing to influence of the learned such stones appear again in the 17th century, e.g., in Telemarken.

² On the Old Norwegian manuscripts see the works cited in notes 4, 5, page 368, for the literature hitherto edited see note 1, page 368

¹⁹ The present writer is indebted to Prof. Joh. Storm for the following remarks on the history of the Norwegian language and its dialects during the 14th and 15th centuries.

collection of legends generally named *Cod Buranus* (written a little after 1350) and *Cod Bilsenunants* (between 1420 and 1450), and the great Oxenstierna manuscript, which consists chiefly of a collection of legends written for the most part in 1555. The very numerous Old Swedish charters, from 1343 downwards, are also of great importance.¹

Form of Old Swedish, during its earliest pre-literary period (900-1200), retains quite as original a character as contemporary Old Icelandic and Old Norwegian. The first part of the inscription of the Rökstone running thus—

AFT UAMU³ STANTA RUNAR þAR IN UARIN FAÐI FAÐIR AFT
FAÐIAN SUNU.²

and probably pronounced—

æft Wámód standa rúnar þær, en Wærenn fæde faðer æft
fæghinn sunu.

[illegible]

FALDER KLOCKE NIDER I HOVOÐ MANNI, BOLI SOPON MARCHUM
BRIM. EN HAN FAR BANG AF—³

would in contemporary Icelandic be-

fellr klukka nýðr í hofuð manni, bóti sókn moikum þrim,
ef hann fær bana af

[illegible][illegible]

Dialectical differences incontestably occur in the runic inscrip- Dialects.

sons as well as in the literature, in the former, however, most of them are hidden from our eyes by the character of the writing, which, as, from a phonetic point of view, highly unsatisfactory, indicating the most different sounds by the same sign (for example, *a, o, y, and e* are denoted by one and the same rune). The latter, on the other hand, suggest the same sound by the same sign, and thus, in the main, deserve to be from a uniform literary language for the whole country, and by the literary productivity and consequent predominant influence of certain provinces (as Ostergötland). This question, moreover, has not hitherto been investigated with sufficient care. Only one distinct dialect has been handed down to us, that of the island of Gotland, which differs so essentially from the Old Swedish of the mainland that it hasw good reason to be characterized, under the name *Forngötisches*, as a certain times a local dialect. Forngötisches is, however, very abundant on our hand, and possesses more than two hundred rune inscriptions, among them a very remarkable one of the 12th or 13th century, coming upwards of three hundred runes, out on a foot (now in Askriekung on the island of Bornholm), and representing the life of Christ in a series of pictures and words, on the other hand a literature has been preserved consisting of a rune calendar from 1328, the law of the island (from about 1350), a piece of traditions, the history of the province of Östergötland, the *Östergötlandske Runor*, the Old Swedish of the mainland especially by the following characteristics — the old diphthongs are preserved (e.g., *auga, eys, dýma*, to dream, *stain*, stone), and a new triphthong has arisen by the change of *ia* into *rau* (as *þrauge*, to fly), the long vowels *e, a, o*, have passed into *e, y, g* (as *kns, knes, niala*, to speak, *dýma*, to deem), short *o* rarely occurs except before *r*, being in other positions changed into *u*, *u* is dropped before *r* (as *mrþr*, mirth), the genitive singular terminates in *-a ends* in *u* (as *kinkur*, of the church), *u* occurs in the entire course of documents, and it is impossible to determine how far the dialects east of the Baltic, which no doubt, had a separate individuality, differed from the mother-tongue

The first to pay attention to the study of Old Swedish was The student
Swedish savant J. Bureus (1658), who by several works (from Of Old
1599 onwards) called attention to and excited a lively interest in Old Swedish
the runic monuments, and, by his edition (1684) of the excellent
Old Swedish work *Om Sýriska Konungas & Hæfyriga*, in Old
Old Swedish literature also. His no longer extant *Specimen Primariæ
Lingue Scandinavice* gave but a very short review of Old Swedish
inflections, but is remarkable as the first essay of its kind, and is
perhaps the oldest attempt in modern times at a grammatical treatise
of any old Germanic language. The study of runes was very
popular in the 17th century, and G. Olofsson's *Om Runornas
äldrade Runor* (see above, p. 370), and J. Hadophris (1698), who
also did good work in editing Old Swedish texts, copied more than
a thousand runic inscriptions. During the 18th century, again,
Old Swedish was almost completely neglected, but in the present
century the study of runes has been well represented by the collection
of the Swede Ljunggren (p. 1887) and by the Norwegian S.

¹ The Old Swedish monuments are for the most part published in the following collections — *Swenska fornkriftsallskaps samlingar*, 84 parts, 1844–84, C J Schlyter, *Samling af Sveriges gamla lagar*, vols 1–vii and x–xi, 1827–69, *Swensk Diplomatarium*, 6 vols, 1829–78, new series, 2 vols, 1875–84.

² In memory of Wámod these runes stand, and Warenn, his father, wrote them in memory of his son, (by destiny) condemned to death

DANISH IV DANISH, like Swedish, is divided into the two great Pre- and Post-Reformation epochs of Old and Modern Danish.

Old Danish 1 *Old Danish*—The territory of Old Danish included not only the present Denmark, but also the southern Swedish provinces of Halland, Skåne, and Blekinge, the whole of Schleswig, and, as stated above, for a short period also a western

Sources of Old Norse literature. The oldest monuments of the literature of England, and Normandy. The oldest monument of the literature of Scandinavia are runic inscriptions, altogether about 250 in number. The oldest of them go as far back as to the beginning of the 9th century, the Sönderlev-stone for instance on Scania, and the Flenstele-stone on Runen. From about the year 900 date the very long inscriptions of Tyggevalde (Scania) and Glavdrup (Sjælland), from the 10th century are the stones of Jelling (Jutland), in memory of the two oldest kings of Denmark (Gorm and Harald), while from about 1000 we have a stone at Dannevirke (Schleswig), raised by the conquest of England, Sven Tyguskegg. Relics of about the same age are the words that were introduced by the Danes into English, the oldest of which date from the end of the 9th century, the time of the first Danish settlement in England, most of these are to be found in the early English *Anglo-Saxon* literature, which literature rose before the 13th century. The oldest manuscript that can be traced down to us dates from the end of that century, written in runes and containing the law of Skåne. From about the year 1300 we possess a manuscript written in Latin characters and containing Valdemar's and Erik's laws of Scania, the Flensborg manuscript of the law of Jutland, and a manuscript of the municipal laws of the province of Schleswig. These three manuscripts represent three different dialects, that is, namely, Skåne, Jutland, and Biskopstads, Scania and the other islands, and that of Jutland and Schleswig. There existed no uniform literary language in the Old Danish period, although some of the most important works of the 16th century, such as Michael's *Poesis* and the *Rhyndæ Chronica* (the first book printed in Danish, in 1485), on account of their excellent diction, contributed materially to the final preponderance of their

As to the form of the language, it hardly differs all during the period between 800 and 1300 A.D. from Old Swedish. It is only in the oldest literature that we can trace any marked differences, these are not very important, and are generally attributable to the fact that Danish underwent a little earlier the same changes than afterwards took place in Swedish (*e g*, *h* in *hw* and *hy* in *hyr*) was mutually changed into *i* and *y* about the 14th century, *g*, *f*, *v* were dropped, and *s* came to be pronounced like *z*. The laws referred to above only agree in difference with the Swedish laws in the following points—the nominative already takes the form of the accusative (as *Lalf*, calf, but Old Swn *kalfen*, acc *lalfj*), the second personal plural ends in *-se* (as *lopa*, but Old Swn *lopna*, you buy), in the subjunctive no differences are expressed between persons and numbers. Among themselves in the comparative, where the Swedes distinguish three degrees, the law of Skåne most nearly corresponds with the Swedish laws, those of Seeland keep the middle place, while the law of Jutland exhibits the most distinctive individuality. The Skåne law, *e g*, retains the vowels *a, i, u* in terminations, which otherwise in Danish have become uniformly *ø*; the same law inserts *b* and *d* between certain consonants (like Old Swn, see p. 387), has preserved the dative in its original form, whereas the other two have the infinitive; the law of Jutland, again, does not insert *b* and *d*, and has dropped the dative, while the present tense (undergoing an "Umlaut") has not always accepted the vowel of the infinitive, in all three characteristics the laws of Seeland fluctuate. After 1650 we meet an essentially altered language, in which as they first note the change of *k, p*, after a vowel into *g, b*, (*as lagst, löp, böbe, to ring, to cast*) and *t, f* into *g, v* (*bring, thrög, hög, vög*); *ll, nd* are pronounced like *lj, nn*, *s* is the general German ending in singular and plural, &c. The vocabulary, which in earlier times only borrowed a few and those mostly ecclesiastical words, is now—chiefly owing to the predominant influence of the Hane towns—mattered by German words, such as those beginning with *be-, de-, för-, and under-*, and ending in *-het*, and a great number of others, as *blise, beske, beske, beske, to happen, fry, free, krig war, buzer, danielsson, cæsse, quite, &c.*

Gram-
matical
treat-
ment

An Old Danish grammar is still wanting, and the preparatory studies which exist are, although excellent, but few in number, being chiefly essays by the Danes K J Lyngby and L F A Wimmer, with N M Petersen's treatise *Det Danske, Norske, og Svenske sprogs historie*, vol. 1 (1829), one of the first works that paid any attention to Old Danish, which till then had been completely neglected. A dictionary on a large scale covering the whole of Old Danish literature, except the very oldest, by O Kalkar, has been in course of publication since 1881, older and smaller is Chr Melbye's *Dansk Glossarium* (1857-66).

2 *Modern Danish*—The first important monument of this is the Modern translation of the Bible, by Chr. Pedersen, Peder Palladius, and others, the so-called Christian III's Bible (1550), famous for its unique purity and excellence of its language, the dialect of Sealand, then incontestably promoted to be the language of the kingdom.

the first second work deserving of the same place as Veddé's *Grammatik* (1675) is the monumental *Grammatik* of 1740, often but far less widely known good Danish grammar, and, however, we have to mention the so-called Christian V's Law of Denmark (1683). For the rest, humanism has stamped a highly Latin-French character on the treating subject, even in the works of the principal writer of this period, Holberg. But about the year 1750 there begins a new movement, characterized by a reaction against the language of the preceding period and punist tendencies, or, at least, efforts to enrich the language with new words (not only in the Latin pattern), as *enklekt*, 'periphrasis', *selvstændighed*, 'independence', *selvbetragtning*, 'self-regard', etc. The leading representatives of these tendencies were Elieskov and Sneedorf. From then time Danish may be said to have acquired its present essential features, though it cannot be denied that several later authors, as J. Ewald and Ohlenschläger, have exercised a considerable influence on the poetical style. As the most important differences between the grammatical forms of the 16th and 17th centuries on one hand and those of the 18th and 17th the language of the 18th and 19th centuries on the other, we must name the substantives take a plural ending, those ending in *-e* most notably, and plural by adding *-r* (as *siges*, for older *sigu*, plural of *sigu*, kingdom), and many of those ending in a consonant by adding *-e* (as *hus* for *husu*, of *hus*, house), substantives ending in *-e* drop then final *-e* (as *danne* for *danne*, judge), the declension with suffixed article, becomes simplified in the same way as in Swedish (see above, p. 372), the plural of verbs takes the singular form (as *druk* for *drukke*, we drank), and the pretérito subjunctive is supplanted by the infinitive (as *at drikke* for *drikke*, to drink). Modern Danish grammar is by E. Pontoppidan, 1688, but the first Modern Danish grammar is by the famous Pærg, 1655. The works of natural the self-taught J. Højsgaard (e.g., *Accuratus* or *raæsoneret grammatik*, 1747) possess great merit, and are of especial importance as regards accent and syntax. The earlier part of this century gave us Rask's grammar (1830). A thoroughly satisfactory Modern Danish grammar does not exist, perhaps the best is that by Th. Möbius (1871). The vocabulary of the 16th and 17th centuries has been collected by J. Ewald, mentioned above, that of the 18th and 19th centuries in the *Sammenhang* and in C. Molbech's Dictionary of *Videnskabsnævne* and in C. Molbech's *Dansk udtryk* (2d ed. 1859).

As already mentioned (§ 370), Danish at the Reformation Dano- became the language of the literary and educated classes of North-Norway and remained so for three hundred years, although wægan it cannot be denied that many Norwegian authors even during this period wrote a language with a distinct Norwegian colour, especially those who employed the popular style. The first instance (1614), the popular poet Peter Danielsen (d. 1708), and in the same degree, also the two literary masters of the 18th century, Holberg and Wessel But it is only since 1814, when Norway gained her independence, that we can clearly perceive the so-called Dano-Norwegian gradually developing as a distinct offshoot of the general Danish language. The first representatives of this new language are the writer of popular literature M. Hansen (? 1842), the poet H. Wergeland (? 1845), and above all the talented C. A. Schibye (d. 1893). In our own days there has been further developed, especially by the great poets Ibsen and Bjørnson and the novelist Løe, and it has been said, not without reason, to have attained its classical perfection in the works of the first-named author. This language differs from Danish particularly in its vocabulary, having adopted very many Norwegian provincial words (6000 to 7000), less in its inflections, but to a very great extent in its pronunciation. The most striking differences in this respect are the following—Norwegian *a*, *i*, *e* answer to Danish *b*. Form of *y* or *j* occurs where there is no corresponding sound in the latter; e.g., *tykke* to run, *tide*, *D* idlen, *tidde*, *bog* bag, *gjø* gage. Danish *k*, *p* before palatal vowels answer Norwegian *j*, *y*, *r* (point-till, not back-fall—as in Danish) is assimilated in some way with following *f* (*d*), *l*, *n*, and the primitive Scandinavian systems of accentuation are still kept separate from a musical point of view, in opposition to the monotonous Danish. There are several other characteristics, nearly all of which are points of correspondence with the old Norse-Dano-Norwegian grammar and syntax, such as *Modermaalsteden* (born 1856), K. Knudsen (*Dansk og Norsk Rettskrift*, 1856), and K. Biekkö (*Buch der Dansk-Norskens talmaale*, 1881), and others.

At the middle of this century, however, far more advanced pre-tensions were urged to an independent Norwegian language. By

the study of the Modern Norwegian dialects and then mother language, Old Norwegian, the eminent philologist J. Asen was led to undertake the bold project of constructing, by the study of these two sources, and on the basis of his native dialect (Söndmål), a Norwegian-Norwegian ("Norsk-Norsk") language, the so-called "Landsmål". In 1852 he exhibited a specimen of it, and, thanks to such excellent writers as Asen himself, the poet, O. Vinge and K. Janson, and the novelist A. Garborg, as well as a zealous propaganda of the society "Det Norske Samlag" (founded in 1868), there has since arisen a valuable though not very large literature in the "Landsmål". But it is now less spoken.¹ Its grammatical structure and vocabulary are exhibited in Asen's *Norsk grammatik*, 1864, and 1869.

DIALECTS

SCANDINAVIAN DIALECTS.—As above remarked, the Scandinavian dialects are not grouped, so far as their relationship is concerned, as might be expected judging from the literary languages. Leaving out of account the Icelandic dialects and those of the Færoes, each of which constitutes a separate group, the remainder may be thus classified:

- (1) *West-Norwegian Dialects*,—spoken on the western coast of Norway between Christiania and the Færoes.
- (2) *North-Scandinavian*,—the remaining Norwegian and the Swedish dialects of Vestmanland, Dalarna, Norland, Finland, and Russia.
- (3) The dialects on the island of Gotland.
- (4) *Volle-Sydsdialekt*,—spoken in the east of Sweden, except the southernmost parts (No. 5).
- (5) *South-Scandinavian*,—spoken in the greater part of Svaland and Halland, the whole of Skåne, Dikinge, and Denmark, and the Danish-speaking part of Schleswig. This group is distinctly divided into three smaller groups,—the dialects of southern Sweden (with the island of Bornholm), of the Danish islands, and of Jutland (and Schleswig).

The study of the Modern Scandinavian dialects has been very uncultivated and neglected. Hardly anything has been done towards the investigation of the Icelandic dialects, while those of the Færoes have been studied chiefly by Hammershamb. The Norwegian dialects have been thoroughly examined by Asen, whose works give a general account of them; while in our own days Joh. Storm, above all, displays an unwearied activity, especially in the minute investigation of their phonetic constitution, to which Asen had paid but scant attention. The substance of these researches in the Norwegian dialects has recently been presented in a magazine, called *Norvegia*, of which the first volume is in course of publication; it employs an alphabet invented by Storm. For the study of Danish dialects but little has been done, Holbech's *Dialects of Denmark* of 1841 being very deficient. The Schleswig dialect, on the contrary, has been admirably treated of by E. Hagerup (1854) and K. J. Lyngby (1858). At present two important works are in preparation.—H. F. Feilberg's great dictionary of the dialect of Jutland, and J. C. Esperisen's of the dialect of Bornholm. There is no country in which the dialects have been and are studied with greater zeal and more fruitful results than in Sweden; during the last hundred and fifty years. Archbishop E. Benzelius the younger (1743) made collections of dialect voices, and on his work is based the dialectal dictionary of 1768. An excellent work considering its age is S. Höf's *Dialectus Vestrogothica*, 1772. The energy and zeal of O. Sæverus (essays on the dialects of Gotland and Dalarna) inspired these studies with extraordinary animation at the middle of the 19th century, in 1837 J. B. Rietz published a voluminous dialect dictionary, the number of special essays, too, increased yearly. From 1872 so-called "landsmålsföreningar" (dia-

lect societies) were founded among the students at the universities of Upsala, Lund, and Helsingfors (at Upsala alone 13), for a systematic and thorough investigation of dialects. We find remarkable progress in scientific method—especially with regard to phonetics—in the constantly increasing literature, special mention may be made of the detailed descriptions of the dialects of Västmanland, Gotland, and Dalarna by Ad. Noreen, and A. F. Fjerdendal's monographs on the Finnish and Estonian Swedish dialects. Since 1879 the Swedish dialect societies have published a magazine on a comprehensive plan, *De Svenska Landsmålen*, edited by J. A. Lundell, who has invented for this purpose an excellent phonetic alphabet (partially based on C. J. Sundvall's work *Om fonetiska bokstäfer*, 1855). (A. N. O.)

acres, but it is not now more than 17 acres 10 perches, or 43 acres, including store yards, dykes, and holms. The first castle was built in the Anglo-Norman period, and is referred to as being in decay in 1154—a fact which throws back its origin earlier than 1136, the date assigned for its erection by William Le Gros, earl of Albemarle and Holderness, its first known governor. The list of its governors stretches from that date to 1832. The streets of the older part of the town, immediately south of the castle hill, come down to the sea, but the newer parts of the south as well as the north side are built upon rising ground. A deep valley (Ramsdale) which divides the south side is bridged from St Nicholas Cliff to the South Cliff. The approach by rail is through the upper part of this valley, by the side of which there is a marsh known as the Mere. The town is thus situated in a kind of basin, which opens out to the north towards extensive and lofty moorland ranges. The modern period of its history dates from 1620, when Mrs Farren, a lady resident, first discovered its mineral springs. The town contained 30,504 inhabitants in 1881, but during the season, which lasts from May to October, its population is augmented by from ten to twenty thousand visitors, for whose convenience there is increasingly ample accommodation. The Grand Hotel, fronting the sea on the south bay, stands on St Nicholas Cliff, at the north side of the Ramsdale valley, and is one of the largest in England. An aquarium (1877) stands beneath the Cliff Bridge, and close by is the museum, a Roman-Doric rotunda, built in 1838. The spa saloon, opened in 1800, contains a hall in the Italian-Renaissance style, a theatre, and refreshment rooms. There is a promenade in front protected by a sea wall. The south spring is aperient but contains some iron, while the north or chalybeate spring is more tonic in its properties. The waters, however, are seldom taken now, the town being mainly frequented for the sea-bathing. The grounds of the present spa are tastefully laid out. A foreshore road, made in 1878 by the corporation, and shortly to be extended round the castle cliff to the north side, makes an excellent drive or promenade. The north side has fine sands, a loist, and a promenade pier, but is not so attractive as the south side, nor are the houses there of so good a character and style. The salubrity of Scarborough is attested by its vital statistics. The mean annual mortality from 1873 to 1882 was 18.4 per 1000. The death-rate from consumption in all England is 2.4 per 1000, amongst the indigenous population of Scarborough from 1873 to 1882 it was 17 per 1000. The mean annual temperature is 47.9 Fahr. In December, January, and February it is only 0.6° colder than Brighton, whilst in the summer months Brighton is 3.6 warmer.

The town is a royal borough, its charter of incorporation dating from 1161. It returned two members to parliament from 1283 to 1885, when one of the seats was taken away. The limits of the municipal and parliamentary boroughs coincide,—the area being 2348 acres, the population 24,259 in 1871 and 30,504 in 1881.

Shipbuilding, salt-manufacture, and knife-making were formerly common, but the only craft now remaining is jet-manufacture. The fishing trade is, however, very considerable. Disputes about dues for the old pier and the fish-tithe occupy a conspicuous place in the town records, the pier seems to have suffered greatly in the various sieges to which the town, after it was walled, became exposed. The old town-hall in St Nicholas Street, the new town-hall in Castle Road, the market-hall in St Helen's Square, in the Tuscan style, and the new post office in Huntress Row are conspicuous amongst the public buildings. There are two theatres. Of the monastic buildings belonging to the Grey Friars, Dominicans, and Carmelites there are no remains, but the parish church of St. Mary, conspicuously situated on a mound to the south of Castle Hill, occupies the site of the old Cistercian monastery. The old church was made the site of a battery in the siege of the castle in 1644, and one of its towers fell in 1659. The

restoration of the present building took place in 1850. There are other churches and chapels of a much more recent date, including a Roman Catholic church. The lighthouse is on the top of a hill, commanding fine views of the moors and of the sea.

The old name of the town was written Skarlabuige. It is not mentioned in Domesday Book, but it was probably called, as Toxt, count of Northumberland, had ravaged and burnt it some time previously. Thoklen mentions it as having been ravaged by Adilrecht, king of Northumberland, and by Harold Hadrada Douglas, the Scottish chief, also burnt it in 1318. Henry II compelled the count of Ansmale to surrender the castle in 1155. King John visited the castle in 1206 and 1216, and the "house and castle of Scarborough" are mentioned in 1223. When not used as a temporary royal residence the castle was a royal prison. In 1312 the earl of Pembroke besieged it, and in the Pilgrimage of Grace insurrection (1536) it was unsuccessfully besieged by Sir Robert Aske. A detailed survey of it, made in 1538, is still extant, the castle yard and land therein described, with the buildings, corresponding with a survey made in 1839. It was again besieged in 1644-45 and in 1648. In 1655 George Fox the Quaker was imprisoned in the castle. In 1645 the town was captured by assault, and in later years its inhabitants were much impoverished by military exactions and expenses. A view of the town and castle in 1485 is still extant. The precise date when the town-walls were dismantled is not known. In 1730 Daniel Defoe, writing from the place, said "The town is well-built, pleasant, and populous, and we found a great deal of company here, drinking the waters, who have not only come from the north of England but from Scotland."

F. R. Smeath, 1880, *Flora of Scarborough*, by G. Russell, 1881, and *Scarborough as a Health Resort*, by A. Haslam, 1883.

SCARLATTI, ALESSANDRO (1659-1725), composer of sacred and dramatic music, was born at Trapani in Sicily in 1659, and became in early youth a pupil of Carissimi. In 1680 Queen Christina of Sweden appointed him her maestro di cappella, and commissioned him to write his first opera, *L'Onestà nell'Amore*, for performance at her palace in Rome. In 1693 he produced his first oratorio, *I Dolori di Maria sempre Vergine*. In the following year he was appointed maestro di cappella to the viceroy of Naples, and from that time forward his works multiplied with astonishing rapidity, his time being spent partly in Naples and partly in Rome, where he entered the service of Cardinal Ottoboni, as private maestro di cappella. His prodigious fertility of invention did not, however, tempt him to write carelessly. On the contrary he did his best to neutralize the evil caused by the founders of the monodic school, whose insane hatred of counterpoint and form reduced their dramatic music to the dreary level of monotonous declamation. He was by far the most learned contrapuntist of his age, and it was to this circumstance that his compositions owed their resistless power. Moreover, his sense of form was as just as his feeling for harmony, and to this he was indebted for the originality of many of his finest conceptions. He has been credited with two very important inventions—accompanied recitative and the *da capo*. That he really did invent the first there is very little doubt. Instances of the latter have been found of earlier date than most of his works, but he was certainly the first to bring it into general use. He also struck out ideas in his orchestral accompaniments which must have seemed bold indeed to the musicians of the period, using obbligato passages and other combinations previously unknown, and introducing *ritornelli* and *sinfonie* with excellent effect. In 1707 Scarlatti was appointed principal maestro di cappella at Santa Maria Maggiore, and soon afterwards he was invested by the pope with the order of the Golden Spur, with which Gluck and Mozart were afterwards honoured. He resigned his appointment after two years' service, and died at Naples October 24, 1725.

Very few of Scarlatti's works have been published. His compositions include 115 operas (41 only of which are now known to exist, and these only in MS.), 200 masses, 9 oratorios, more than

500 cantatas, and innumerable smaller pieces, both sacred and secular. MISS of three of his operas, *Gerone*, *Il Flauto Giustetto*, and *La Teodora Augusta*, are preserved in the library of Christ Church, Oxford, and *Il Principino Fortunato* forms part of the "Dragonetti Collection" in the British Museum.

SCARLATTI, DOMENICO (1683-1757), son of the preceding, was born at Naples in 1683, and studied music first under his father and then under Gasparini. He began his career by composing a few operas, among them *Amleto*, produced at Rome in 1715, and remarkable as the earliest known attempt to pose Shakespeare's hero as the *primo uomo di una dramma per la musica*. But his real strength lay in the excellence of his performances on the harpsichord and organ. During Handel's first sojourn in Italy in 1708-9 D. Scarlatti was invited to a trial of skill with him on both instruments at the palace of Cardinal Ottoboni, and all present decided that the harpsichord performances terminated in a drawn battle, though Handel had a decided advantage on the organ. The justice of the verdict cannot be doubted, for, whenever Scarlatti was afterwards praised for his organ-playing, he used to cross himself devoutly and say, "You should hear Handel!"

On the death of Bai in 1715 D. Scarlatti was appointed maestro di cappella of St Peter's in Rome. In 1719 he conducted the performance of his *Narciso* at the King's Theatre in London, and in 1721 he played with great success in Lisbon. He then returned to Naples, but in 1729 he was invited to Madrid, with the appointment of teacher to the princess of Asturias, and remained there twenty-five years, retaining in 1754 to Naples, where he died in 1757.

D. Scarlatti's compositions for the harpsichord are almost innumerable, and many of them have been published. In the character of them *technique* they are infinitely in advance of the age in which they were written and played, and many of them are difficult enough to tax the powers of the best performers of the present day.

SCARLET FEVER and SCARLATINA are names applied indifferently to an acute infectious disease, characterized by high fever, accompanied with sore throat and a diffuse red rash upon the skin. This fever appears to have been first accurately described by Sydenham in 1676, before which period it had evidently been confounded with small-pox and measles.

In connexion with the causation of this disease, the following points have been ascertained: (1) It is a highly contagious malady, the infective material being one of the most subtle, diffuse, and lasting known in fevers. It would seem that the disease is communicable from an early period of its occurrence, all through its progress, and especially during convalescence when the process of desquamation is proceeding, and when the shed-off epidermis which contains the germs of the disease in great abundance is apt to be inhaled, to become attached to articles of clothing, to find entrance into food, or to be transmitted in other ways to healthy persons. (2) It is a disease for the most part of early life, young children being specially susceptible, but adults may also suffer if they have not had this fever in childhood. (3) It occurs both in isolated cases (sporadically) and in epidemics. (4) One attack in general, although not always, confers immunity from a second. (5) Certain constitutional conditions act as predisposing causes favouring the development of the fever. Thus, where overcrowding prevails, and where the hygienic state of children is ill attended to, the disease is more likely to prevail and spread, and to assume unfavourable forms. Further, in the puerperal state in women there appears to be a special susceptibility to suffer in a dangerous manner should there be exposure to the infection of the fever. As to the nature of the infecting agent, nothing positive is known, although from the analogy of similar diseases it is

probable that specific micro-organisms or germs are concerned in its production.

The period of incubation in scarlet fever (that is, the time elapsing between the reception of the poison and the development of symptoms) appears to vary. Sometimes it would seem to be as short as one or two days, but in most instances it is probably about a week. The invasion of this fever is generally sudden and sharp, consisting in rigors, vomiting, and sore throat, together with a rapid rise of temperature and increase in the pulse. Occasionally, especially in young children, the attack is ushered in by convulsions. These premonitory symptoms usually continue for about twenty-four hours, when the characteristic eruption makes its appearance. It is first seen on the neck, chest, arms, and hands, but quickly spreads all over the body, although it is not distinctly marked on the face. This rash consists of minute thickly-set red spots, which coalesce to form a general diffuse redness, in appearance not unlike that produced by the application of mustard to the skin. In some instances the redness is accompanied with small vesicles containing fluid. In ordinary cases the rash comes out completely in about two days, when it begins to fade, and by the end of a week from its first appearance it is usually gone. The severity of a case is in some degree measured by the copiousness and brilliancy of the rash, except in the malignant varieties, where there may be little or no eruption. The tongue, which at first was furred, becomes about the fourth or fifth day denuded of its epithelium and acquires the peculiar "strawberry" appearance characteristic of this fever. The interior of the throat is red and somewhat swollen, especially the uvula, soft palate, and tonsils, and a considerable amount of secretion exudes from the inflamed surface. There is also tenderness and slight swelling of the glands under the jaw.

In favourable cases the fever departs with the disappearance of the eruption and convalescence sets in with the commencement of the process of "desquamation" or peeling of the cuticle, which first shows itself about the neck, and proceeds slowly over the whole surface of the body. Where the skin is thin the desquamation is in the form of fine branny scales, but where it is thicker, as about the hands and feet, it comes off in large pieces, which sometimes assume the form of casts of the fingers or toes. The duration of this process is variable, but it is rarely complete before the end of six or eight weeks, and not unfrequently goes on for several weeks beyond that period. It is during this stage that complications are apt to appear, particularly those due to cold, such as inflammation of the kidneys, and all throughout its continuance there is the further danger of the disease being communicated to others by the cast-off epidemic scales.

Scarlet fever shows itself in certain well-marked varieties, of which the following are the chief—

1. *Scarlatina Simplex* is the most common form, in this the symptoms, both local and general, are moderate, and the case usually runs a favourable course. It is always, however, to be borne in mind that the duration and the infectiveness of the disease, including its convalescence, are uninfluenced by the mildness of the attack. In some rare instances it would seem that the evidences of the disease are so slight, as regards both fever and rash, that they escape observation and only become known by the patient subsequently suffering from some of the complications associated with it. In such cases the name *latent scarlet fever* (*scarlatina latens*) is applied.

2. *Scarlatina Anginosa* is a more severe form of the fever, particularly as regards the throat symptoms. The rash may be well marked or not, but it is often slow in developing and in subsiding. There is intense inflammation of the throat, the tonsils, uvula, and soft palate being swollen and ulcerated, so laying upon them membranous patches not unlike those of diphtheria, while externally the gland tissues in the neck are enlarged and indurated and not unfrequently become the seat of abscesses. There is difficulty in opening the mouth, an acrid discharge exudes from the nostrils and excoriates the lips, and the countenance is pale and waxy.

looking. This form of the disease is marked by great prostration of strength, and it is much more frequently fatal than the preceding.

3 *Scarlatina Maligna* is the most serious form of all. The malignancy may be variously displayed. Thus a case of scarlatina anginosa may acquire a severe character, both as to throat and general symptoms, as rapidly to produce profound exhaustion and death. But the typically malignant forms are those in which the attack sets in with great violence and the patient sinks from the very first. In such instances the rash either does not come out at all or is of the slightest amount and of livid rather than scarlet appearance, while the throat symptoms are often not prominent. Death in such cases may take place in from twenty-four to forty-eight hours, and is frequently preceded by great elevation of the temperature of the body and by delirium, coma, or other nervous symptoms. A further example of a malignant form is occasionally observed in cases where the rash, which had previously been well-developed, suddenly recedes, and convulsions or other nervous phenomena and rapid death supervene.

The complications and effects of scarlet fever are, as already indicated, among the most important features in this disease, and, although their occurrence is exceptional, they appear with sufficient frequency, and are of such a nature, as ought to make the medical attendant carefully watch every case for any of their early indications. The most common and serious of these is inflammation of the kidneys, which may arise during any period in the course of the fever, but is especially apt to appear in the convalescence, while desquamation is in progress. Its onset is sometimes announced by a return of feverish symptoms, accompanied by vomiting and pain in the loins; but in a large number of instances it occurs without these and comes on insidiously. One of the most prominent symptoms is slight swelling of the face, particularly of the eyelids, which is rarely absent in this complication. If the urine is examined it will probably be observed to be diminished in quantity and of dark smoky or red appearance, due to the presence of blood, while it will also be found to contain a large quantity of albumen. This, together with the microscopic examination which reveals the presence of tube casts containing blood, epithelium, &c., testifies to a condition of acute inflammation of the kidney (glomerular and tubal nephritis). In favourable cases these symptoms may soon disappear, but they may on the other hand prove extremely serious,—the risks being the suppression of urine, leading to uræmic poisoning and causing convulsions which may terminate fatally, or, further, the rapid development of general dropsy, and death from this cause. Although thus a very formidable complication, it is yet one which is amenable to treatment, and by the prompt and judicious application of remedies lives may often be saved, even in desperate circumstances. Occasionally this condition does not wholly pass off, and consequently lays the foundation for BRIGHT'S DISEASE (*q v*). Another of the more common complications or results of scarlet fever is suppuration of the ears, due to the extension of the inflammatory process from the throat along the Eustachian tube into the middle ear. This not unfrequently leads to permanent ear-discharge, with deafness from the disease affecting the inner ear and temporal bone, a condition implying a degree of risk from its proximity to the brain. Other maladies affecting the heart, lungs, pleura, &c., occasionally arise in connection with scarlet fever, but they are of less common occurrence than those previously mentioned. Apart, however, from such definite forms of disease there may remain as the result of scarlet fever simply a general weakening of health, which may render the patient delicate and vulnerable for a long time.

In the treatment of scarlet fever, one of the first requirements is the isolation of the case, with the view of preventing the spread of the disease. In large houses this may be possible, but in most instances it can only be satisfactorily accomplished by sending away those other members of the

family who have not suffered from the fever. The establishment in many large towns of hospitals for infectious diseases, which provide accommodation for patients of all classes, affords the best of all opportunities for thorough isolation. In large families, where few or none of the members have had the disease, the prompt removal of a case to such an hospital will in many instances prevent the spread of the fever through the household, as well as beyond it, and at the same time obviate many difficulties connected with the cleansing and purification of the house, which, however carefully done, may still leave remaining some risk in the case of a fever the contagious power of which is so intense.

When, however, the patient is treated at home, the sick room should contain only such furniture as may be required, and the attendants should come as little as possible in contact with other members of the household. Should other children be in the house, they should be kept away from school during all the time that the risk of infection continues. The possibility of the fever being communicated by letters sent from the sick room should not be forgotten by those in attendance. Disinfectants, such as carbolic acid, Condy's fluid, &c., may be used freely in the room and passages, and all body or bed clothes when removed should be placed at once in boiling water, or in some disinfecting fluid. In convalescence, with the view of preventing the transmission of the desquamated cuticle, theunction of the body with carbolized oil (1 in 40) and the frequent use of a bath containing soda are to be recommended.

All books, toys, &c., used by the patient during the illness should be carefully destroyed or given to fever hospitals, as their preservation has frequently been known to cause an outbreak of the disease at a subsequent time. With respect to the duration of the infective period, it may be stated generally that it is seldom that a patient who has suffered from scarlet fever can safely go about before the expiry of eight weeks, while on the other hand the period may be considerably prolonged beyond this, the measure of the time being the completion of the process of desquamation in every portion of the surface of the body. As to general management during the progress of the fever,—in favourable cases little is required beyond careful nursing and feeding. The diet all through the fever and convalescence should be of light character, consisting mainly of milk food. Soups may be taken, but solid animal food should as far as possible be avoided. During the febrile stage a useful drink may be made by a weak solution of chlorate of potash in water (1 drachm to the pint), and of this the patient may partake freely. In the more severe forms of the disease, where the throat is much affected, the application with a brush of a strong solution of Condy's fluid or other disinfectant, such as boroglyceride, glycerine of carbolic acid, quinine, &c., may be required, or gargling with these substances when this can be done. In the malignant variety, where the eruption is not appearing, or is but ill developed, stimulants internally, and the hot bath or pack, may sometimes afford a chance, or the hypodermic use of pilocarpin,—although it must be confessed that in such cases little can be expected from any remedies. The treatment of the kidney complication and its accompanying dropsy is similar to that for acute Bright's disease. Depletion by leeching or cupping the loins, and the promotion of cutaneous action by a hot air bath or a hot wet pack, or by pilocarpin, are the most useful measures, and will often succeed in saving life. The abscesses of the neck which occasionally occur as complications should be opened antiseptically, while the ear disorders, which are apt to continue long after the termination of convalescence, will demand the special attention of the aurist.

(J. O. A.)

SCARRON, PAUL (1610–1660), poet, dramatist, novelist, and husband of Madame de Maintenon, was born or at least baptized on the 14th July 1610. His father, of the same name, was a man of position, and a member of the parlement of Paris. Paul the younger (who is said to have quarrelled with his stepmother) became an abbé, was not ill-allowed, and travelled to Rome in 1634. He returned and became a well-known figure in literary and fashionable society. A wild story used to be told of his having (when in residence at his canonry of Le Mans) tarred and feathered himself as a carnival freak, of his having been obliged to take refuge from popular wrath in a swamp, and of his consequent deformity from rheumatism. The simple fact seems to be that in 1637 he had an attack of fever with the usual sequelæ of rheumatic attacks, and that he put himself into the hands of a quack doctor. This at least is how Tallemant tells the story, though he substitutes a less creditable disease for fever. What is certain is that Scarron, after having been in perfect health for nearly thirty years, passed twenty more in a state of miserable deformity and pain. His head and body were twisted, and his legs became useless. Nevertheless he bore up against his sufferings with invincible courage, though they were complicated by his inheriting nothing from his father, and by the poverty and misconduct of his sisters, whom he supported. For a few years he really held a benefice at Le Mans, but was then in no case to play pranks. It is said, however, that here he conceived the idea of the *Roman Comique* and wrote the drama of *Jodet*, which gave a nickname to the actor who performed it. In 1646 he returned to Paris and worked hard for the booksellers, from the name of one of whom he is said to have called literature pleasantly his "marquisat de Quinet." He had also a pension from Mazarin and one from the queen, but lost both from being accused of "Frondeur" sentiments. The most singular action of his life remains to be told. In his early years he had been, as hinted, something of a libertine, and a young lady of some family, Céleste Palaiseau, had openly lived with him. But in 1632, sixteen years after he had become almost entirely paralysed, he married a girl of much beauty and no fortune, Françoise or Françoise d'Aubigné, granddaughter of Agrippa d'Aubigné, afterwards famous as Madame de Maintenon. Scarron's house was, both before and after the marriage, a great centre of society, despite his narrow means. Yet only the most malignant and unscrupulous libellers of the future favourite accuse her of light conduct during the eight years of her marriage to this strange husband, and the well-informed author of the *Histoires* distinctly acquits her of any such. But Scarron, who had long been able to endure life only by the aid of constant doses of opium, was at length worn out, and died on the 6th October 1660.

Scarron's work is very abundant, and, written as it was under pressure of want and pain, it is very unequal. The piece most famous in his own day, his *Virgile Traicté* (1643–53), is now thought, and not unjustly, a somewhat ignoble and unprofitable waste of singular powers for burlesque. But the *Roman Comique* (1651) is a work the merit of which can be denied by no competent judge who has read it. Unfinished, and a little desultory, this history of a troop of strolling actors is almost the first French novel, in point of date, which shows real power of painting manners and character, and is singularly vivid. It furnished Théophile Gautier with the idea and with some of the details of his *Capitaine Fracasse*. Scarron also wrote some shorter novels of merit, which are thought to have inspired Molière and Sedaine. Of his plays *Jodet* (1646) and *Don Saphir d'Arménie* (1659) are the best. Both these and the others which he wrote are of course somewhat antiquated in style, but with Corneille's *Menteur* they stand above everything else in comedy before Molière. He also produced many miscellaneous pieces.

Scarron is generally spoken of and thought of as a representative writer of burlesque, but in reality he possessed in abundance the finer of true comedy. The most complete edition of his works is

held to be that of 1737 (10 vols., Amsterdam), but his more celebrated pieces, including all those mentioned above, have been frequently reprinted.

SCAUP, the wild-fowler's ordinary abridgment of SCAUP-DUCK, meaning a Duck so called "because she feeds upon *Scawp*, i.e., broken shellfish," as may be seen in Willughby's *Ornithology* (p. 365), but it would be more proper to say that the name comes from the "Mussel-scaups," or "Mussel-scalps," the beds of rock or sand on which *Mussels* (*Mytilus edulis*, and other species) are aggregated,—the *Anas marila* of Linnaeus and *Fulgula marila* of modern systematic writers, a very abundant bird around the coasts of most parts of the northern hemisphere, repairing inland in spring for the purpose of reproduction, though so far as is positively known hardly but in northern districts, as Iceland, Lapland, Siberia, and the fur-countries of America. It was many years ago believed (*Edin. N. Philos. Journal*, xx p. 293) to have been found breeding in Scotland, but assertions to that effect have not been wholly substantiated, though apparently corroborated by some later evidence (*Proc. N. H. Soc. Glasgow*, ii p. 121, and *Proc. Phys. Soc. Edinburgh*, vii p. 203). The Scaup-Duck has considerable likeness to the POCHARD (vol. xix p. 282), both in habits and appearance, but it much more generally affects salt-water, and the head of the male is black, glossed with green, and hence the name of "Black-head," by which it is commonly known in North America, where, however, a second species or race, smaller than the ordinary one, is also found, the *Fulgula affinis*. The female Scaup-Duck can be readily distinguished from the Dunbird or female Pochard by her broad white face. (A. N.)

SCEPTICISM signifies etymologically a state of doubt or indecision in the face of different mutually conflicting statements (*σκέπτομαι*, I consider, reflect, hesitate, doubt). It is implied, moreover, that this doubt is not merely a stage in the road to certainty and true knowledge. The provisional suspense of judgment recommended by Descartes and others as the true beginning of philosophy is no more than a passing phase of the individual's mind in his search for truth. But the doubt of the sceptic is professedly the last result of investigation, it is the renunciation of the search for truth on the ground that truth or real knowledge is unattainable by man. An account of the chief historical appearances of scepticism and its different motives will serve to illustrate and amplify this statement, and will lead up to any further considerations of a general nature. At the outset, and in general terms, scepticism may be summarily defined as a thoroughgoing impachment of man's power to know—as a denial of the possibility of objective knowledge.

Trust, not distrust, is the primitive attitude of the mind. History. What is put before us, whether by the senses or by the statements of others, is instinctively accepted as a veracious report, till experience has proved the possibility of deception. In the history of philosophy, in the same way, affirmation precedes negation, dogmatism goes before scepticism. And this must be so, because the dogmatic systems are, as it were, the food of scepticism; without them it would be without motive, without a *basis operantis*. Accordingly, we find that sceptical thought did not make its appearance till a succession of positive theories as to the nature of the real, by their mutual inconsistency, had suggested the possibility that they might all alike be false. The Sophistic epoch of Greek philosophy was, in great part, such a negative reaction against the luxuriance of self-confident assertion in the nature-philosophies of the preceding age. Though scepticism as a definite school of opinion may be said, in accordance

¹ "Scalp" primarily signifies a shell, cf. Old Dutch *schelge* and Old Fr. *escalope* (Skeat, *Etymol. Dictionary*, p. 528).

with old precedent, to date only from the time of Pyrrho of Elis, there can be no doubt that the main current of Sophistic thought were sceptical in the wider sense of that term. The Sophists were the first in Greece to dissolve knowledge into individual and momentary opinion (*Protagoras*), or dialectically to deny the possibility of knowledge (*Gorgias*). In these two examples we see how the weapons forged by the dogmatic philosophers to assist in the establishment of their own theses are sceptically turned against philosophy in general. As every attempt to rationalize nature implies a certain process of criticism and interpretation to which the data of sense are subjected, and in which they are, as it were, transcended, the antithesis of reason and sense is formulated early in the history of speculation. The opposition, being taken as absolute, implies the impeachment of the veracity of the senses in the interest of the rational truth proclaimed by the philosophers in question. Among the pre-Socratic nature-philosophers of Greece, Heraclitus and the Eleatics are the chief representatives of this polemic against the "lying witness" of the senses. The diametrical opposition of the grounds on which the veracity of the senses is impugned by the two philosophies (*viz.*, by Heraclitus because they testify to an apparent permanence and identity in things, by the Eleatics because they testify to an apparent multiplicity and change) was in itself suggestive of sceptical reflection. Moreover, although these philosophers are not in any sense themselves sceptical, their arguments are easily susceptible of a wider application. Accordingly we find that the arguments by which Heraclitus supported his theory of the universal flux are employed by Protagoras to undermine the possibility of objective truth, by dissolving all knowledge into the momentary sensation or persuasion of the individual. The idea of an objective flux, or law of change constituting the reality of things, is abandoned, and subjective points of sense alone remain,—which is tantamount to eliminating the real from human knowledge.

Still more unequivocal was the sceptical nihilism expressed by Gorgias in his three celebrated theses—(1) nothing exists; (2) if anything existed, it would be unknowable; (3) if anything existed and were knowable, the knowledge of it could not be communicated. The arguments of his book, "Concerning the Non-existent, or Nature," were drawn from the dialectic which the Eleatics had directed against the existence of the phenomenal world. But they are no longer used as indirect proofs of a universe of pure and unitary Being. The prominence given by most of the Sophists to rhetoric, their cultivation of a subjective readiness as the essential equipment for life, their substitution of persuasion for conviction, all mark the sceptical undertone of their teaching. This attitude of indifference to real knowledge passed in the younger and less reputable generation into a corroding moral scepticism which recognized no good but pleasure and no right but might.

What Socrates chiefly did was to recreate the instinct for truth and the belief in the possibility of its attainment. The scientific impulse thus communicated was sufficient to drive scepticism into the background during the great age of Greek philosophy (*i.e.*, the hundred years preceding Aristotle's death, 323 B.C.). The cautious logic of the Megarian school,—in which the Eleatic influence was strong,—their devotion to eristic and the elaboration of fallacies, was indeed in some cases closely related to sceptical results. The school has been considered with some truth to form a connecting link with the later scepticism, just as the contemporary Cynicism and Cyrenaicism may be held to be imperfect preludes to Stoicism and Epicureanism. The extreme nominalism of some of the

Cynics also, who denied the possibility of any but identical judgments, must be similarly regarded as a solvent of knowledge. But with these insignificant exceptions it holds true that, after the sceptical wave marked by the Sophists, scepticism does not reappear till after the exhaustion of the Socratic impulse in Aristotle.

The first man in antiquity whose scepticism gave name to his doctrine was Pyrrho of Elis (about 360–270 B.C.). Pyrrho proceeded with the army of Alexander the Great as far as India, in the company of Anaxarchus, the Democritean philosopher. He afterwards returned to his native city, where he lived in poor circumstances, but highly honoured by his fellow-citizens. Pyrrho himself left no writings, and the accounts of his doctrine are mainly derived from his pupil Timon of Phlius (about 325–235 B.C.). Timon is called the Sillographist, from his satirical poem (*Σίλλαι*), in which all the philosophers of Greece are held up to ridicule, with the exception of Xenophanes, who honestly sought, and Pyrrho, who succeeded in finding, the truth. Other disciples are mentioned besides Timon, but the school was short-lived, its place being presently taken by the more moderate and cultured doubt of the New Academy. Zeller sums up Pyrrho's teaching in three propositions.—We know nothing about the nature of things, hence the right attitude towards them is to withhold judgment, the necessary result of withholding judgment is imperturbability. The technical language of the school expresses the first position by the word *ἀκαταληψία*, things are wholly incomprehensible or inaccessible, against every statement the opposite may be advanced with equal justice (*ισοσθένεια τῶν λόγων*). The sceptical watchword which embodies the second position is *ἐποχή*, reserve of judgment, or, as it is put by Timon, *οὐδὲν μάλλον*, that is, no one assertion is truer than another. This complete suspense of opinion is also expressed by the terms *ἀρρήθεια*, or equilibrium, and *ἀρασία*, or refusal to speak, as well as by other expressions. The Pyrrhonists were consistent enough to extend their doubt even to their own principle of doubt. They thus attempted to make their scepticism universal, and to escape the reproach of basing it upon a fresh dogmatism. Mental imperturbability (*ἀταραξία*) was the result to be attained by cultivating such a frame of mind. The happiness or satisfaction of the individual was the end which dominated this scepticism as well as the contemporary systems of Stoicism and Epicureanism, and all three philosophies place it in tranquility or self-centred indifference. Scepticism withdraws the individual completely into himself from a world of which he can know nothing. It is men's opinions or unwarranted judgments about things, say the sceptics, which betray them into desire, and painful effort, and disappointment. From all this a man is delivered who abstains from judging one state to be preferable to another. But, as complete inactivity would have been synonymous with death, it appears to have been admitted that the sceptic, while retaining his consciousness of the complete uncertainty enveloping every step, might follow custom in the ordinary affairs of life.

The scepticism of the New Academy (or, to speak more strictly, of the Middle Academy, under Arcesilaus and Carneades, founders respectively of the so-called second and third Academies) differed very little from that of the Pyrrhonists. The differences asserted by later writers are not borne out on investigation. But the attitude maintained by the Academics was chiefly that of a negative criticism of the views of others, in particular of the somewhat crude and imperious dogmatism of the Stoics. They also, in the absence of certainty, allowed a large scope to probability as a motive to action, and defended their doctrine on this point with greater care and skill. The

Scepticism of the Academy.

whole position was stated with more urbanity and culture, and was supported, by Carneades, in particular, by argumentation at once more copious and more acute. It seems also true that the Academics were less overborne than the Pyrrhonists by the practical issue of their doubts (imperturbability); their interest was more purely intellectual, and they had something of the old delight in mental exertion for its own sake. Aresilas or Arcesilas (about 315-240 B.C.) made the Stoic theory of irresistible impressions (*ἀναρτία καταληπτικά*) the special object of his attack. Alere irresistibility (*κατάληψις*), he maintained, is no criterion of truth, since false perceptions may equally possess this power to sway the mind. He seems chiefly to have supported his position by adducing the already well-known arguments of former philosophers against the veracity of the senses, and he evidently held that by these arguments the possibility of knowledge in general was sufficiently subverted. We can know nothing, he concluded,—not even this itself, that we know nothing. He denied that the want of knowledge reduces us to inaction. Notions influence the will immediately, apart from the question of their truth, and, in all questions of conduct, probability (*τὸ εὐλογον*) is our sufficient guide, as it is our highest attainable standard. It is stated that Arcesilas made his negative criticism merely a preliminary to the inculcation of a modified Platonism. But this account, though not in itself incredible, is not borne out by any evidence at our disposal. The theory of Carneades (213-129 B.C.) represents the highest development of Academic scepticism. The dogmatic system which Carneades had in view was that of Chrysippus, the Stoic, whose main positions, whether in the theory of knowledge, in morals, or in theology, he subjected to an acute and thorough-going criticism. As to the criterion of truth, Carneades denied that this could be found in any impression, as such, for in order to prove its truth an impression must testify, not only to itself, but also to the objects causing it. We find, however, admittedly, that in many cases we are deceived by our impressions, and, if this is so, there is no kind of impression which can be regarded as guaranteeing its own truth. According to his own examples, it is impossible to distinguish objects so much alike as is one egg to another, at a certain distance the painted surface seems raised, and a square tower seems round, an oar in water seems broken, and the neck-plumage of a pigeon assumes different colours in the sun; objects on the shore seem moving as we pass by, and so forth. The same applies, he argued, to purely intellectual ideas. Many fallacies cannot be solved, and we cannot, for example, draw any absolute distinction between much and little, or, in short, between any quantitative differences. Our impressions, therefore, furnish us with no test of truth, and we can derive no aid from the operations of the understanding, which are purely formal, combining and separating ideas without giving any insight into their validity. Besides this general criticism of knowledge, Carneades attacked the cardinal doctrines of the Stoic school,—their doctrine of God and their proof of divine providence from the evidences of design in the arrangements of the universe. Many of his arguments are preserved to us in Cicero's *Academica* and *De Natura Deorum*. His criticism of the contradictions involved in the Stoic idea of God really constitutes the first discussion in ancient times of the personality of God, and the difficulty of combining in one conception the characters of infinity and individuality. As a positive offset against his scepticism, Carneades elaborated more fully the Academic theory of probability, for which he employed the terms *ὑποπόρις* and *πιθανότης*. Being necessarily ignorant of the relation of ideas to the

objects they represent, we are reduced to judging them by their relation to ourselves, *i.e.*, by their greater or less clearness and appearance of truth. Though always falling short of knowledge, this appearance of truth may be strong enough to determine us to action. Carneades recognized three degrees of probability. The first or lowest is where our impression of the truthfulness of an idea is derived simply from the idea itself, the second degree is where that impression is confirmed by the agreement of related ideas, if a careful investigation of all the individual ideas bears out the same conclusion, we have the third and highest degree of probability. In the first case, an idea is called probable (*πιθανή*), in the second, probable and undisputed (*πιθανή καὶ ἀπερίσπαστος*), in the third, probable, undisputed, and tested (*πιθανή καὶ ἀπερίσπαστος καὶ περιωδευμένη*). The scepticism of Carneades was expounded by his successor Chitomachus, but the Academy was soon afterwards (in the so-called fourth and fifth Academies) invaded by the Eclecticism which about that time began to obliterate the distinctions of philosophical doctrine which had hitherto separated the schools. Cicero also, who in many respects was strongly attracted by the Academic scepticism, finally took refuge in a species of Eclecticism based upon a doctrine of innate ideas, and on the argument from the *consensus gentium*.

The later scepticism—which is sometimes spoken of as the third sceptical school—claimed to be a continuation of the earlier Pyrrhonism. Aenesidemus, though not absolutely the first to renew this doctrine, is the first of whose doctrine anything is known. He appears to have taught in Alexandria about the beginning of the Christian era. Among the successors of Aenesidemus, the chief names are those of Agrippa, whose dates cannot be determined, and the physician Sextus Empiricus (about 200 A.D.), whose *Pyrrhonic Hypotyposes*, and his work *Adversus Mathematicos*, constitute a vast armoury of the weapons of ancient scepticism. They are of the utmost value as an historical record. With Saturninus, the pupil of Sextus, and Favorinus, the grammarian, ancient scepticism may be said to disappear from history. What speculative power remained was turned entirely into Neoplatonic channels. To Aenesidemus belongs the first enumeration of the ten so-called tropes (*τρόποι*), or modes of sceptical argument, though the arguments themselves were, of course, current before his time. The first trope appeals to the different constitution of different animals as involving different modes of perception, the second applies the same argument to the individual differences which are found among men, the third insists on the way in which the senses contradict one another, and suggests that an endowment with more numerous senses would lead to a different report as to the nature of things; the fourth argues from the variability of our physical state and mental moods, the fifth brings forward the diversities of appearance due to the position and distance of objects, the sixth calls attention to the fact that we know nothing directly, but only through some medium, such as air or moisture, whose influence on the process cannot be eliminated, the seventh refers to the changes which the supposed object undergoes in quantity, temperature, colour, motion, &c., the eighth really sums up the thought which underlies the whole series, when it argues from the relativity of all our perceptions and notions, the ninth points out the dependence of our impressions on custom, the new and strange impressing us much more vividly than the customary, the tenth adduces the diversity of customs, manners, laws, doctrines, and opinions among men. Aenesidemus likewise attacked the notion of cause at considerable length, but neither in his arguments nor in the

Sceptical
trope.

Arcesilas

Carneades

numerous objections brought against the notion by Sextus Empiricus do we meet with the thought which furnished the nerve of modern scepticism in Hume. The practical result of his scepticism Ænesidemus sought, like the Pyrrhonists, in *ἀταξία*. He is somewhat strangely said to have combined his scepticism with a revival of the philosophy of Heraclitus, but the assertion perhaps rests, as Zeller contends, on a confusion. To Agrippa is attributed the reduction of the sceptical tropes to five. Of these, the first is based on the discrepancy of human opinions, the second on the fact that every proof itself requires to be proved, which implies a *regressus in infinitum*, the third on the relativity of our knowledge, which varies according to the constitution of the percipient and the circumstances in which he perceives. The fourth is really a completion of the second, and forbids the assumption of unproven propositions as the premises of an argument. It is aimed at the dogmatists, who, in order to avoid the *regressus in infinitum*, set out from some principle illegitimately assumed. The fifth seeks to show that reasoning is essentially of the nature of a *circularis in probando*, inasmuch as the principle adduced in proof requires itself to be supported by that which it is called in to prove. The attack made in several of these five tropes upon the possibility of demonstration marks this enumeration as distinctly superior to the first, which consists in the main of arguments derived from the fallibility of the senses. The new point of view is maintained in the two tropes which were the result of a further attempt at generalization. Nothing is self-evident, says the first of these tropes, for, if all things were certain of themselves, men would not differ as they do. Nor can anything be made certain by proof, says the second, because we must either arrive in the process at something self-evident, which is impossible, as has just been said, or we must involve ourselves in an endless regress.

When we review the history of ancient thought, we find, as Zeller puts it, that "the general result of all sceptical inquiries lies in the proposition that every assertion may be opposed by another, and every reason by reasons equally strong—in the *ἰσοσθένεια τῶν λόγων*. Or, as the same thing may be expressed, what all sceptical proofs come back to is the relativity of all our ideas. We can never know the nature of things as they are, but always only the manner in which they appear to us. The criterion of the sceptic is the appearance. Not even his own proof can claim truth and universal validity: he does not assert, he only seeks to relate how a thing strikes him at the present moment. And even when he expresses his doubts in the form of universal statements they are intended to be included in the general uncertainty of knowledge" (*Phil. d. Griechen*, in 2, p. 58). Both Zeller and Hegel, it may be added, remark upon the difference between the calm of ancient scepticism and the perturbed state of mind evinced by many modern sceptics. Universal doubt was the instrument which the sceptics of antiquity recommended for the attainment of complete peace of mind, rest and satisfaction can be attained, they say, in no other way. By the moderns, on the other hand, doubt is portrayed, for the most part, as a state of unrest and painful yearning. Even Hume, in various noteworthy passages of his *Treatise*, speaks of himself as recovering cheerfulness and mental tone only by forgetfulness of his own arguments. His state of universal doubt, so far from being painted as a desirable goal, is described by him as a "malady" or as "philosophical melancholy and delirium." The difference might easily be interpreted either as a sign of sentimental weakness on the part of the moderns or as a proof of the limitation of the ancient sceptics which rendered them more easily satisfied in the

absence of truth. It seems to prove, at all events, that the ancient sceptics were more thoroughly convinced than their modern successors of the reasonableness of their own attitude. But whether the ancients were the better or the worse sceptics on that account is a nice question which need not be decided here. It may be doubted, however, whether the thoroughgoing philosophical scepticism of antiquity has any exact parallel in modern times, with the single exception possibly of Hume's *Treatise on Human Nature*. It is true we find many thinkers who deny the competency of reason when it ventures in any way beyond the sphere of experience, and such men are not unfrequently called sceptics. This is the sense in which Kant often uses the term, and the usage is adopted by others,—for example, in the following definition from Ueberweg's *History of Philosophy*—"The principle of scepticism is universal doubt, or at least doubt with regard to the validity of all judgments respecting that which lies beyond the range of experience." The last characteristic, however, is not enough to constitute scepticism, in the sense in which it is exemplified in the ancient sceptics. Scepticism, to be complete, must hold that even within experience we do not rationally conclude but are irrationally induced to believe. "In all the incidents of life," as Hume puts it, "we ought still to preserve our scepticism. If we believe that fire warms, or water refreshes, 'tis only because it costs us too much pains to think otherwise" (*Treatise*, bk. 1 iv. 7). This tone, which faintly represents the attitude of ancient sceptics, is rare among the moderns, at least among those who are professed philosophers. It is more easily matched in the unsystematic utterances of a man of the world like Montaigne.

One form of scepticism, however, may be claimed as Scepticism exclusively modern growth, namely, philosophical scepticism in the interests of theological faith. These sceptics are primarily Apologists. Their scepticism is not "de bonne foy"; it is simply a means to the attainment of a further end. They find that the dogmas of their church have often been attacked in the name of reason, and it may be that some of the objections urged have proved hard to rebut. Accordingly, in an access of pious rage, as it were, they turn upon reason to rend her. They deny her claim to pronounce upon such matters; they go further, and dispute her prerogative altogether. They endeavour to show that she is in contradiction with herself, even on matters non-theological, and that everywhere this much vaunted reason of man (*la superbe raison*) is the creature of custom and circumstance. Thus the "imbecility" of reason becomes their warrant for the reception by another organ—by faith—of that to which reason had raised objections. The Greeks had no temptation to divide man in two in this fashion. When they were sceptics, their scepticism had no ulterior motives, it was an end in itself. But this line of argument was latent in Christian thought from the time when St Paul spoke of the "foolishness" of preaching. Tertullian fiercely re-echoed the sentiment in his polemic against the philosophers of antiquity—"Crucifixus est Dei filius, non pudet, quia pudendum est. Et mortuus est Dei filius, prorsus credibile est, quia ineptum est. Et sepulchrum resurrexit, certum est, quia impossibile est." But, as Christianity became firmly established, Christian writers¹ became more tolerant of speculation; and, instead of

¹ This turn of thought is not confined, however, to Christian thinkers; it appears also in the Arabian philosophy of the East. Ab. Ghazali (Algazel) (1058-1111) in his *Tahafut al-Falasifa* ("The Collapse of the Philosophers") is the advocate of complete philosophical scepticism in the interests of orthodox Mohammedanism—an orthodoxy which passed, however, in his own case into a species of mysticism. He did his work of destruction so thoroughly that Arabian philosophy died out after his time in the land of its birth.

flaunting the unreconcilable opposition of reason and dogma, they laboured to reduce the doctrines of the church to a rational system. This was the long task essayed by Scholasticism, and, though the great Schoolmen at the 13th century refrained from attempting to rationalize such doctrines as the Trinity and the Incarnation, they were far from considering them as essentially opposed to reason.

It was not till towards the close of the Middle Ages that a sense of conflict between reason and revelation became widely prevalent and took shape in the essentially sceptical theory of the twofold nature of truth. Philosophical truth, as deduced from the teaching of Aristotle, it was said, directly contradicted the teaching of the church, which determines truth in theology, but the contradiction leaves the authority of the latter unimpaired in its own sphere. It is difficult to believe that this doctrine was ever put forward sincerely, in the most of those who professed it, it was certainly no more than a veil by which they sought to cover their heterodoxy and evade its consequences. Rightly divining as much, the church condemned the doctrine as early as 1276. Nevertheless, it was openly professed during the period of the break up of Scholastic Aristotelianism. Pomponatus, the Alexandrist of Padua (ob. 1525), was one of its best known advocates.

Theory
of the
twofold
nature
of truth

Pascal. The typical and by far the greatest example of the Christian sceptic is Pascal (1623-1662). The form of the *Pensées* forbids the attempt to evolve from them detached utterances a completely coherent system. For, though he declares at times "Le pyrrhonisme est le vrai," "Se moquer de la philosophie c'est vraiment philosopher," or, again, "Humiliez-vous, raison impuissante, taisez-vous, nature imbécile," other passages might be quoted in which he assumes the validity of reason within its own sphere. But what he everywhere emphatically denies is the possibility of reaching by the unassisted reason a satisfactory theory of things. The contradictions which meet us everywhere are summed up and concentrated in the nature of man. Man is a hopeless enigma to himself, till he sees himself in the light of revelation as a fallen creature. The fall alone explains at once the nobleness and the meanness of humanity; Jesus Christ is the only solution in which the baffled reason can rest. These are the two points on which Pascal's thought turns. "There is nothing which is more shocking to our reason" than the doctrine of original sin, yet, in his own words, "le nœud de notre condition prend ses replis et ses tours dans cet abîme, de sorte que l'homme est plus inconcevable sans ce mystère que ce mystère n'est inconcevable à l'homme." Far, therefore, from being able to sit in judgment upon the mysteries of the faith, reason is unable to solve its own contradictions without aid from a higher source. In a somewhat similar fashion, in the present century, Lamennais (in the first stage of his speculations, represented by the *Essai sur l'Indifférence en Matière Religieuse*, 1817-21) endeavoured to destroy all rational certitude in order to establish the principles of authority; and the same profound distrust of the power of the natural reason to arrive at truth is exemplified (though the allegation has been denied by the author) in the writings of Cardinal Newman. In a different direction and on a larger scale, Hamilton's philosophy of the conditioned may be quoted as an example of the same religious scepticism. Arguing from certain antinomies, said to be inherent in reason as such, Hamilton sought to found theology (in great part at least) upon our necessities, and to substitute belief for knowledge. He also imitated Pascal at times in dilating upon the "impotence" and "imbecility" of our faculties, but, as with Pascal, this was rather in reference to their incapacity to evolve an

"absolute" system than to their vacacity in the ordinary details of experience. The theological application and development of Hamilton's arguments in Mansel's Bampton Lectures *On the Limits of Religious Thought* marked a still more determined attack, in the interests of theology, upon the competency of reason.

Passing from this particular vein of sceptical or semi-sceptical thought, we find, as we should expect, that the downfall of Scholasticism, and the conflict of philosophical theories and religious confessions which ensued, gave a decided impetus to sceptical reflexion. One of the earliest instances of this spirit is afforded by the book of Agrippa of Nettesheim (1487-1535), *De Incertitudine et Vanitate Scientiarum*. Sceptical reflexion rather than systematic scepticism is what meets us in Michel de Montaigne (1533-1592), though the elaborate presentation of sceptical and relativistic arguments in his "Apologie de Raymond Sebond" (*Essays*, ii. 12), and the emblem he recommends—a balance with the legend, "Que scay-je?"—might allowably be adduced as evidence of a more thoroughgoing Pyrrhonism. In his "tesmoynages de nostre imbecillité," he follows in the main the lines of the ancients, and he sums up with a lucid statement of the two great arguments in which the sceptical thought of every age resumes itself—the impossibility of verifying our faculties, and the relativity of all impressions.¹ The argument from the mutuality of opinions and customs was probably the one which appealed most strongly to himself. In the concluding lines of this essay, Montaigne seems to turn to "nostre foy chrestienne" as man's only succour from his native state of helplessness and uncertainty. But undoubtedly his own habitual frame of mind is better represented in his celebrated saying—"How soft and healthful a pillow are ignorance and incuriousness . . . for a well-ordered head." More inclined than Montaigne to give a religious turn to his reflexions was his friend Pierre Charron (1541-1603), who in his book *De la Sagesse* systematized in somewhat Scholastic fashion the train of thought which we find in the *Essays*. François Sanchez (1563-1633), professor of medicine and philosophy in Toulouse, combated the Aristotelianism of the schools with much bitterness, and was the author of a book with the title *Quod nihil scitur*. Of more or less isolated thinkers, somewhat later in point of time, who wrote in the same sceptical spirit, may be mentioned the names of François de la Mothe le Vayer (1588-1672), whose *Cinq Dialogues* appeared after his death under the pseudonym of Orosius Tubero, Samuel Sorbière (1615-1670), who translated the *Hypotyposes Pyrrhones* of Sextus Empiricus, Simon Foucher (1644-1696), canon of Dijon, who wrote a *History of the Academies*, and combated Descartes and Malebranche from a sceptical standpoint. The work of Hieronymus Hirnheim of Prague (1637-1679), *De Typho Generis Humani sive Scientiarum Humanarum Inani ac Ventoso Tumore*, was written in the interests of revelation. This is still more the case with the bitter polemic of Daniel Huet (1630-1721), *Censura Philosophica Cartesianæ*, and his later work, *Tratés Philosophiques de la Faiblesse de l'Esprit Humain*. The scepticism of Joseph Glanvill (1636-1680), in his two works *The Vanity of Dogmatizing* (1661) and *Scepers Scientifica* (1665), has more interest for Englishmen. Glanvill was not a sceptic at all

Sceptics
in 16th
and 17th
centuries

¹ "Four juger des apparences que nous recevons des subjects, il nous faudroit un instrument judicatoire, pour verifier cet instrument, il nous y faut de la demonstration, pour verifier la demonstration, un instrument, nous voylà au rouet. Finalement il n'y a aucune constante existence, ny de nostre estre ny de celui des objets, et nous, et nostre jugement, et toutes choses mortelles, vont coulant et roulant sans cesse, ainsi, il ne se pult établir rien, de certain de l'un à l'autre, et le jugement et le jugé estants en continuelle mutation et brouille" (*Essays*, Ganner, i. 570).

points, seeing that he was full of enthusiasm for the advance of physical science and for the newly-founded Royal Society. But he attacked unsparingly the Aristotelianism of the schools, which was still dominant at Oxford. Against this, and also against the materialistic dogmatism of Hobbes, he invoked the weapons of scepticism, and he was led by his own arguments to query "whether there be any science in the sense of the dogmatists." He based this conclusion partly upon the ground that our knowledge of causes, being derived simply from "concomitancy," is far from being "infallibly conclusive." "The causality itself," he says, anticipating Hume, "is insensible"; accordingly, "the foundation of scientific procedure is too weak for so magnificent a superstructure." More celebrated than any of the above was Pierre Bayle (1617-1706), whose scepticism lay more in his keen negative criticism of all systems and doctrines which came before him as literary historian than in any theoretic views of his own as to the possibility of knowledge. Bayle also paraded the opposition between reason and revelation, but the argument in his hands is a double-edged weapon, and when he extols the merits of submissive faith his sincerity is at least questionable.

Hume, the most illustrious and indeed the typical sceptic of modern times, is treated at length in a separate article. Here, therefore, it is only necessary to point out shortly in what his scepticism consists. It is sometimes placed, as we have seen it is by Kant, in his distrust of our ability and right to pass beyond the empirical sphere. But the mere denial of the possibility of "divinity or school metaphysics," as we find it in the *Inquiry*, combined with an apparent confidence in "experimental reasoning concerning matter of fact and existence," does not constitute scepticism, but rather what would now be called agnosticism or positivism. It is essential to the sceptical position that reason be dethroned within experience as well as beyond it, and this is undoubtedly the result at which Hume arrives in his larger and more thoroughgoing work. More generally, therefore, his scepticism may be considered to lie in his relation to preceding philosophy. The *Treatise* is a *reductio ad absurdum* of the principles of Lockianism, inasmuch as these principles, when consistently applied, leave the structure of experience entirely "loosened" (to use Hume's own expression), or cemented together only by the irrational force of custom. Hume's scepticism thus really arises from his thoroughgoing empiricism. Starting with "particular perceptions" or isolated ideas let in by the senses, he never advances beyond these "distinct existences." Each of them exists on its own account, it is what it is, but it contains no reference to anything beyond itself. The very notion of objectivity and truth therefore disappears, the *Schein* or appearance of the moment is the only reality. Hume's analysis of the conceptions of a permanent world and a permanent self reduces us to the sensationalistic relativism of Protagoras. He expressly puts this forward in various passages as the conclusion to which reason conducts us. The fact that the conclusion is in "direct and total opposition" to the apparent testimony of the senses is a fresh justification of philosophical scepticism. For, indeed, scepticism with regard to the senses is considered in the *Inquiry* to be sufficiently justified by the fact that they lead us to suppose "an external universe which depends not on our perception," whereas "this universal and primary opinion of all men is soon destroyed by the slightest philosophy." Scepticism with regard to reason, on the other hand, depends on an insight into the irrational character of the relation which we chiefly employ, viz. that of cause and effect. It is not a real relation in objects but rather a mental habit of belief engendered by frequent

repetition or custom. This point of view is applied in the *Treatise* universally. All real connexion or relation, therefore, and with it all possibility of an objective system, disappears, it is, in fact, excluded by Hume *ab initio*, for "the mind never perceives any real connexion among distinct existences." Belief, however, just because it rests, as has been said, on custom and the influence of the imagination,¹ survives such demonstrations. "Nature," as Hume delights to reiterate, "is always too strong for principle." "Nature, by an absolute and uncontrollable necessity, has determined us to judge as well as to breathe and feel." The true philosopher, therefore, is not the Pyrrhonist, trying to maintain an impossible equilibrium or suspense of judgment, but the Academic, yielding gracefully to the impressions or maxims which he finds, as matter of fact, to have most sway over himself. "I may—nay, I must—yield to the current of nature, in submitting to my senses and understanding, and in this blind submission I show most perfectly my sceptical principles," for, after all, "if we believe that fire warms or water refreshes, 'tis only because it costs us too much pains to think otherwise."²

The system of Kant, or rather that part of his system expounded in the *Critique of Pure Reason*, though expressly distinguished by its author from scepticism, has been included by many writers in their survey of sceptical theories. The difference between Kant, with his system of pure reason, and any of the thinkers we have passed in review is obvious, and his limitation of reason to the sphere of experience suggests in itself the title of agnostic or positivist rather than that of sceptic. Yet, if we go a little deeper, there is substantial justification for the view which treats agnosticism of the Kantian type as essentially sceptical in its foundations and in its results. For criticism not only limits our knowledge to a certain sphere, but denies that our knowledge within that sphere is real; we never know things as they actually are, but only as they appear to us. Our knowledge, in Kant's language, does not show us "the inward essence of the object in itself, but only the relation of the object to the subject." But this doctrine of relativity really involves a condemnation of our knowledge (and of all knowledge), because it fails to realize an impossible and self-contradictory ideal. The man who impeaches the knowing faculties because of the fact of relation which they involve is pursuing the phantom of an apprehension which, as Lotze expresses it, does not apprehend things, but is itself things; he is desirous not to know but to be the things themselves. If this dream or prejudice be exploded, then the scepticism originating in it—and a large proportion of recent sceptical thought does so originate—loses its *raison d'être*.³ The prejudice, however, which meets us in Kant is, in a somewhat different form, the same prejudice which is found in the tropes of antiquity—what Lotze calls "the inadmissible relation of the world of ideas to a foreign world of objects" which

¹ "Belief is more properly an act of the sensitive than of the cognitive part of our nature."
² *rests.*

³ Much the same conclusion is reached in what is perhaps the ablest English exposition of pure philosophical scepticism since Hume—Mr Arthur Balfour's *Defense of Philosophic Doubt* (1879). "The reader may wish to know," says Mr Balfour, "what constitute the 'claims on our belief' which I assert to be possessed alike by science and theology, and which I put forward as the sole practical foundation on which our convictions ultimately rest." Whatever they may be, they are not rational grounds of conviction. "It would be more proper to describe them as a kind of inward inclination or impulse" (pp. 316-7).

⁴ It may be as well to add that the sceptical side of Kantianism is mainly confined to the *Critique of Pure Reason*, but this side of Kantian thought has been most widely influential. The remarks made above would not apply to the coherent system of idealism which may be evolved from Kant's writings and which many would consider alone to deserve the name of Kantianism or Criticism.

Prejudices on which scepticism rests.

For, as he rightly points out, whether we suppose idealism or realism to be true, in neither case do the things themselves pass into our knowledge. No standpoint is possible from which we could compare the world of knowledge with such an independent world of things, in order to judge of the conformity of the one to the other. But the abstract doubt "whether after all things may not be quite other in themselves than that which by the laws of our thought they necessarily appear" is a scepticism which, though admittedly irrefutable, is as certainly groundless. No arguments can be brought against it, simply because no arguments can be brought to support it, the scepticism rests on nothing more than the empty possibility of doubting. This holds true, even if we admit the "independent" existence of such a world of things. But the independence of things may with much greater reason be regarded as itself a fiction or prejudice. The real "objective" to which our thoughts must show conformity is not a world of things in themselves, but the system of things as it exists for a perfect intelligence. Scepticism is deprived of its persistent argument if it is seen that, while our individual experiences are to be judged by their coherence with the context of experience in general, experience as a whole does not admit of being judged by reference to anything beyond itself.

To the attack upon the possibility of demonstration, inasmuch as every proof requires itself a fresh proof, it may quite fairly be retorted that the contradiction really lies in the demand for proof of the self-evident, on which all proof most ultimately depend. It is of course always possible that in any particular case we may be deceived, we may be assuming as self-evidently true what is in reality not so. But such incidental lapses are found to correct themselves by the consequences in which they involve us, and they have no power to shake our trust in the general validity of reason. It may, however, be granted that the possibility of lapse throws us open to the objections, ingenious or disingenuous, of the sceptic, and we must remain exposed to them so long as we deal with our first principles as so many isolated axioms or intuitions. But the process of self-correction referred to points to another proof—the only ultimately satisfactory proof of which first principles admit. Their evidence lies in their mutual interdependence and in the coherence of the system which they jointly constitute.

Of a scepticism which professes to doubt the validity of every reasoning process and every operation of all our faculties it is, of course, as impossible as it would be absurd to offer any refutation. Here, as Butler incisively put it, "we can go no further. For it is ridiculous to attempt to prove the truth of those very perceptions whose truth we can no otherwise prove than by other perceptions of exactly the same kind with them, and which there is just the same ground to suspect, or to attempt to prove the truth of our faculties, which can no otherwise be proved than by means of those very suspected faculties themselves." This absolute scepticism, indeed, can hardly be regarded as more than empty words, the position which they would indicate is not one which has ever existed. In any case, such scepticism is at all times sufficiently refuted by the impensable and justifiable trust of reason in itself. The real function of scepticism

Function
of scepti-
cism

in the history of philosophy is relative to the dogmatism which it criticizes. And, as a matter of fact, it has been seen that many so-called sceptics were rather critics of the effete systems which they found cumbering the ground than actual doubters of the possibility of knowledge in general. And even when a thinker puts forward his doubt as absolute it does not follow that his successors are bound to regard it in the same light. The progress

of thought may show it to be, in truth, relative, as when the nerve of Hume's scepticism is shown to be his thoroughgoing empiricism, or when the scepticism of the *Critique of Pure Reason* is traced to the unavailing assumption of things-in-themselves. When the assumptions on which it rests are proved to be baseless, the particular scepticism is also overcome. In like manner, the apparent antinomies on which such a scepticism builds will be found to resolve themselves for a system based on a deeper insight into the nature of things. The serious thinker will always repeat the words of Kant that, in itself, scepticism is "not a permanent resting-place for human reason." Its justification is relative and its function transitional.

Authorities—Ancient scepticism is fully treated in the relative parts of Zeller's *Philosophie der Griechen*, with which may be compared Zimmermann's *Darstellung d. Pyrrhonischen Philosophie* (1841), and Ueber *Ursprung u. Bedeutung d. Pyrrh. Phil.* (1848), Wachsmuth, *De Timone Philaso* (1859), Geffers, *De Avicula* (1849), Norman MacCall, *Greek Sceptics from Pyrrho to Sextus* (1899), Haas, *De Philosophia Pyrrhonica u. Successoribus* (1875). Among other works may be mentioned Studlin, *Geschichte und Geist d. Scepticismus*, vorzüglich in Rücksicht auf Moral u. Religion (1794), Tafel, *Geschichte d. Scepticismus* (1834), E. Saussure, *Le Scepticisme*. *Épictète*, Pascal, Kant (1875). (A SE)

SCEPTRE. Though the sceptre is now used principally as one of the insignia of royalty, the word originally had a more extended meaning. Among the early Greeks the *σκήπτρον* was simply a long staff used by aged men (*Il.* xvii 416, Herod. i. 196), and thus came to be used as a sign of authority by officials of many kinds—judges, military leaders, priests, heralds, and others. It is frequently represented on Greek painted vases as a long staff, tipped with metal in some ornamental fashion, and is borne by some of the gods. Among the Etruscans sceptres of great magnificence were used by the kings and also by the upper orders in the priesthood. Many representations occur on the walls of the painted tombs of Etruria. Some specimens which still exist are among the finest examples known of ancient jewellery. The British Museum, the Vatican, and the Louvre possess Etruscan gold sceptres of the most minute and elaborate workmanship. Some of these are hollow gold batons, about nine to twelve inches long and half an inch in diameter, completely covered with that very delicate ornament for which the Etruscan goldsmiths were so famed, produced by soldering thousands of microscopically minute globules of gold arranged in rich patterns on to the plain gold cylinder which forms the ground. One magnificent specimen in the gold-ornament room of the British Museum has its top formed like a flower, with outer petals of beaten gold and an inner core made by a large emerald, it is of the greatest beauty both in workmanship and design.

The sceptre of the Romans, like most of their insignia of rank, is said to have been derived from the Etruscans. An old and more Latinized form of the word is *scæptro* (see *Liv.* v 41). Under the republic an ivory sceptre (*scæptum eburneum*) was one of the marks of consular rank. It was also used by victorious generals who received the title of *imperator*, and thus its use still survives in the modern marshal's baton. In Roman paintings the long staff-like sceptre is frequently represented in the hands of Jupiter and Juno, as chief of the gods.

Under the empire the *scæptum Augusti* (Suet. *Galba*, i) was specially used by the emperors. It was often of ivory, tipped with a gold eagle (*Juv. Sat.* x 43), and is frequently shown on medallions of the later empire, which have on the obverse a half-length figure of the emperor, holding in one hand the short eagle-tipped sceptre and in the other the orb surmounted by a small figure of Victory. The older staff-like form of sceptre still survived under

the name *hasta pura*, it is shown on the reverses of many Roman coins in the hand of deities and of the emperor or empress, though originally the *hasta pura* had a very different use, being simply a mark of distinction given by Roman generals to soldiers who had shown unusual bravery (Tac., *Ann.*, ii. 21). After the introduction of Christianity as the state religion, the imperial sceptre was frequently tipped with a cross instead of the eagle, though both were used. All through the Middle Ages both these forms survived, and sceptres of gold studded with jewels were used by most sovereigns of Europe. The gold sceptre of Charlemagne, a magnificent specimen of early jeweller's work, still exists among the regalia at Vienna. Some mediæval sceptres were of crystal or ivory mounted in gold. Several fine ancient examples existed among the regalia of England till after the death of Charles I., when the whole set were broken up and melted by order of the Parliament.

At the Restoration, four new sceptres were made for the coronation of Charles II (see *Archæologia*, xxix. p. 262), and these still exist among the regalia in the Tower. They are—(1) the so-called St Edward's staff of gold, 4 feet 7 inches long, set with jewels, and surmounted with a cross and orb—a copy of the older one which contained in the orb a fragment of the true cross (this sceptre is borne in front of the sovereign during the processional part of the ceremony of coronation), (2) a gold sceptre tipped with a cross, which at the coronation is placed in the sovereign's right hand by the archbishop of Canterbury, (3) a similar sceptre tipped with a gold dove, which is placed in the sovereign's left hand,¹ (4) a small gold jewelled sceptre for the queen consort. Nos. (1) and (2) are both studded with diamonds. In addition to these four, there is a gold-mounted ivory sceptre, which was made for the queen of James II., it is tipped with a gold dove and is studded with jewels. A sixth gold sceptre is that which was made for the queen at the coronation of William and Mary.

Among the Scottish regalia at Edinburgh a fine 15th-century gold sceptre still exists; and others of the same or earlier date are preserved among the royal insignia of several European countries.

SCHADOW, a distinguished name in the annals of German art

I JOHANN GOTTFRIED SCHADOW (1764–1850), an eminent sculptor, was born in 1764 in Berlin, where his father was a poor tailor. His first teacher was an inferior sculptor, Tassaert, patronized by Frederick the Great, the master offered his daughter in marriage, but the pupil preferred to elope with a girl to Vienna, and the father-in-law not only condoned the offence but furnished money wherewith to visit Italy. The young man made the most of advantages which in those days fell to the lot of few: he gained in competition a prize for a group of Perseus and Andromeda, three years' study in Rome formed his style, and in 1788 he returned to Berlin to succeed his former master, Tassaert, as sculptor to the court and secretary to the Academy. Prussia in rising into a great kingdom had need for much sculpture, and Schadow brought timely talent and exceptional training. Over half a century, crowded with commissions, he persistently produced upwards of two hundred works, varied in style as in subjects. Among his ambitious efforts are Frederick the Great in Stettin, Blücher in Rostock, and Luther in Wittenberg. His portrait statues include Frederick the Great playing the flute, and the crown-princess Louise and

her sister. His busts, which reach a total of more than one hundred, comprise seventeen colossal heads in the Walhalla, Ratisbon, from the life were modelled Goethe, Wieland, and Fichte. Of church monuments and memorial works thirty are enumerated, yet Schadow hardly ranks among Christian sculptors. He is claimed by classicists and idealists: the quadriga on the Brandenburger Thor and the allegorical frieze on the façade of the Royal Mint, both in Berlin, are judged among the happiest growths from the antique. Fauns, nymphs, cupids, and figures of fancy, scattered among plain portrait work, kept alive to an advanced age early associations formed in Italy. Schadow, as director of the Berlin Academy, gave proof of intellectual powers which made him a leader and secured many and devoted followers. Personal influence he extended and fortified by his books. He wrote on the proportions of the human figure, on national physiognomy, &c.; and many volumes by himself and others describe and illustrate his method and his work. He died, full of honours, at Berlin in 1850.

II RUDOLPH SCHADOW (1786–1822), sculptor, son of the preceding, was born in Rome in 1786. His father, who returned to Berlin in 1788, was his first master. Rudolph in 1810 obtained the pension for Rome and received kindly help from Canova and Thorwaldsen. His talents were versatile: his first independent work was a figure of Paris, and it had for its companion a spinning girl. Following the example set by leading German artists then settled in Rome, he exchanged the Protestant for the Catholic faith, and gave pledge of his convictions by statues of John the Baptist and of the Virgin and Child. In England he became known by bas-reliefs executed for the duke of Devonshire and for the marquis of Lansdowne. His last composition, commissioned by the king of Prussia, was a colossal group, Achilles with the Body of Penthesilea, the model, universally admired for its antique character and the largeness of its style, had not been carried out in marble when in 1822 the artist died in Rome.

III FRIEDRICH WILHELM SCHADOW (1789–1869), painter, born in 1789 in Berlin, was the second son of Johann Gottfried Schadow the sculptor, from whom he received his earliest instruction. In 1806–7 he served as a soldier, in 1810 he went with his elder brother Rudolph to Rome. He became one of the leaders among the German pre-Raphaelite brethren who eschewed classicism and the Italian Renaissance and sought to rebuild Christian art on the principles and practice of early and purer times. Following the example of Overbeck and others, he joined the Catholic Church, and held that an artist must believe and live out the truths he essays to paint. The sequel showed that Schadow was qualified to shine less as a painter than as a teacher and director. The Prussian consul, General Bartholdi, befriended his young compatriots by giving them a commission to decorate with frescos a room 24 feet square in his house on the Prussian Hill. The artists engaged were Schadow, Cornelius, Overbeck, and Veit, the subject selected was the story of Joseph and his brethren, and two scenes, the Bloody Coat and Joseph in Prison, fell to the lot of Schadow. These well-studied and sound wall-paintings brought renown to the brethren, who were further fortified by the friendship of Niebuhr and Bunsen; the former writes—“They are all men of talent,” and “Schadow is particularly refined and intellectual.” Schadow was in 1819 appointed professor in the Berlin Academy, and his ability and thorough training gained devoted disciples. To this period belong pictures for churches. In 1826 the professor was made director of the Düsseldorf Academy, and so highly were his character and teachings esteemed that some of the best scholars accompanied their master. The

¹ Both these sceptres (or rather the older ones) were shown, one in each hand of the fine bronze effigy of Edward III in Westminster Abbey, but as a rule royal effigies were represented with only one sceptre.

high and sacred art matured in Rome Schadow transplanted to Dusseldorf, he reorganized the Academy, which in a few years grew famous as a centre of Christian art to which pupils flocked from all sides. In 1837 the director selected, at request, those of his scholars best qualified to decorate the chapel of St Apollinaris on the Rhine with frescos, which when finished were accepted as the fullest and purest manifestation of the Dusseldorf school on its spiritual side. To 1842 belong the Wise and Foolish Virgins, in the Stadel Institute, Frankfurt, this large and important picture is carefully considered and wrought, but lacks power. Schadow's fame indeed rests less on his own creations than on the school he formed, he imparted to others nobility of conception, beauty of form, refinement and delicacy in expression and execution. Yet the master in Dusseldorf encountered opposition a reaction set in against the spiritual and sacerdotal style he had established, a younger generation rose who stigmatized his system as narrow and bigoted, and in 1859 the party of naturalism and realism after a severe struggle drove the venerable director from his chair. Schadow died at Dusseldorf in 1862, and a monument in the platz which bears his name was raised at the jubilee held to commemorate his directorate.

(P. A.)

SCHAFARIK (in Bohemian ŠAFÁŘÍK), PAUL JOSEPH (1795-1861), was by origin a Slovak, and was born in 1795 at Kobylarova, a village of northern Hungary, where his father was a Protestant clergyman. It was not till his sixteenth year that any enthusiasm was aroused in him for the language and literature of his race. At this time an essay of Jungmann's fell into his hands, and at once gave a direction to his studies. His first production was a volume of poems in Bohemian entitled *The Muse of Tatara with a Slavonic Lyre*, published at Levoča in 1814. After this we find him collecting Slovak songs. In 1815 he began a course of study at the university of Jena, and while there translated into Czech the *Clouds* of Aristophanes and the *Marva Stuart* of Schiller. In 1817 he came to Prague and joined the literary circle of which Dobrovsky, Jungmann, and Hanka were members. In 1819 he was appointed headmaster of the high school at Neusatz (Novi Sad) in the south of Hungary, he remained occupied with the duties of this office till 1833. But besides his educational functions he busied himself with the study of Servian literature and antiquities, and acquired many rare books and manuscripts. In 1826 his *Geschichte der Slavischen Sprache und Literatur nach allen Mundarten* appeared at Pesth. This may truly be called an epoch-making book in the history of Slavonic studies. It was the first attempt to give anything like a systematic account of the Slavonic languages, the knowledge of which was at that time in such a rudimentary state that even Schafarik is not able to classify properly the Bulgarian language, but has grouped it with Servian. In 1833 appeared his *Serbische Lesekommer oder historisch-kritische Beleuchtung der Serbischen Mundart*, and in 1837 his great work *Slovanské Starožitnosti* ("Slavonic Antiquities"), by which he is at the present time best known. The "Antiquities" have been translated into Polish, Russian, and German, and we are promised an English version shortly from the pen of Mrs Alexander Kerr. This valuable work was enlarged and improved in the second edition, which appeared among the collected works of Schafarik, edited by Jireček after the author's death. In 1840 he published in conjunction with Palacký *Die ältesten Denkmäler der böhmischen Sprache*, in which he defended the authenticity of those Bohemian documents which have been declared spurious by some scholars. In the year 1837 poverty compelled him to accept the un congenial office of censor of Czech publications, which he abandoned in 1847 on becoming custodian of the

Prague public library. In 1842 he published his valuable work *Slovanský Národops*, which gives a complete account of Slavonic ethnology. In 1848 he was made professor of Slavonic philology in the university of Prague, but resigned it in the following year, probably from causes in some way connected with the political troubles of that period, of which Prague was one of the centres. He was then made keeper of the university library, in which office he continued till his death in 1861. He had long been in broken health,—his pains of body being augmented by brain disease, which had been brought on by his severe literary labours and also by family anxieties. His latter days were devoted to philology, one of the chief subjects treated of by him being the antiquity of the Glagolitic alphabet, about which he held very different opinions at various periods of his life. He was also for some time conductor of the "Journal" of the Bohemian Museum, and edited the first volume of the *Výbor*, or selections from old Czech writers, which appeared under the auspices of the literary society in 1845. To this he prefixed a grammar of the Old Bohemian language. His correspondence with Pogodin has been published by Prof Nil Popoff of Moscow among the letters of that eminent scholar.

Schafarik was a man of the purely literary type,—an indefatigable worker, an enthusiast, and a sincere patriot. The study of Slavonic philology and ethnology has advanced since his time, but the greater part of his work is permanent and monumental. Besides his collected writings (*Sbírání Spisy*), which were reprinted at Prague after his death during the years 1862-1865, a posthumous work by him also made its appearance, edited by J. Jireček, *Geschichte der Sudslavischen Literatur*.

SCHAFFHAUSEN, in area (111.7 square miles) and actual population (33,348) the 19th and in relative density of population the 7th of the cantons of Switzerland, forms the most northern angle of the Swiss territory, and lies on the right or German side of the Rhine, which separates it from the cantons of Thurgau and Zurich. It is divided into three distinct portions by spurs of the grand-duchy of Baden, which also possesses the small enclave of Busenung on the Rhine. Geologically it belongs for the most part to the Swabian Jura, and directly or indirectly it all drains to the Rhine, which forms its famous falls in the neighbourhood of the chief town (see RHINE, vol. xx p. 519). In the broad straths of the Klettgau vine-growing and agriculture go hand in hand (the vines of Hallau being in high repute), the more elevated districts of Randen and Reyat (highest point 3040 feet above the sea) raise the grain-production of the canton above the home demand, and also provide large quantities of potatoes, hemp, and flint. Under a careful regime the forests are recovering from a state of comparative exhaustion. The Schaffhausen cattle are partly Swabian and partly Swiss, Klettgau has a special breed of pigs of its own. Manufacturing industries have their best development at Schaffhausen-Neuhausen. The population, which increased from 55,300 in 1850 to 33,348 in 1860, is almost exclusively of German speech (230 individuals only using other languages). Protestants are to Roman Catholics as 8 to 1 (33,897 and 4154); the latter are attached to the bishopric of Basel. Schaffhausen has been a member of the Swiss confederation since 1601. By the new constitution of 1876 it became remarkably democratic. The great council consists of representatives of the people elected for four years at the rate of one for every five hundred inhabitants. On the petition of any thousand of the electors, a measure may be introduced to the chamber or submitted to the direct vote of the citizens. The five members of the administration are also popularly elected. Education is well endowed, primary education being compulsory. A reformatory for destitute children is maintained at Friedeck, near Buch.

SCHAFFHAUSEN, the capital of the above canton, is situated on the bank of the Rhine, 30½ miles by rail west of Constance and 60 east of Basel, and communicates by a bridge with the village of Feuerthalen (1000 inhabitants) in Zurich. It is a city of contrasts—medieval architecture of the true Swabian type and modern manufactures mingling curiously together. The cathedral, formerly the church of the abbey of All Saints (Alleheiligen), is a massive basilica founded in 1104 and completed in 1453; its great bell (1486) bears the inscription *Pro eo voco, mortuos plango, fulgura frango*, which suggested Schiller's "Song of the Bell" and the opening of Longfellow's *Golden Legend*. On the Rebhugel above the town rises the castle of Munoth (1564–1590) with bomb-proof casemates, and a tower whose top is reached by a spiral ascent up which one can ride or drive. In Herrenacker Platz stands the Inthurneum, a building erected (1864) and presented to the town by a Swiss citizen, resident in London, for the "promotion of æsthetic and scientific culture"; it contains a theatre, concert-rooms, &c. The public library (28,000 volumes) possesses the printed and MS collections of Johann von Müller, who was born at Schaffhausen in 1752, and his monument adorns the promenade of the Vesenstaub. In the museum is preserved the famous Kesslerloch "find." Among the industrial establishments of the city and vicinity are ironworks, waggon and carriage factories, woollen and cotton factories, breweries, distilleries, and champagne factories. The population of the commune was 10,303 in 1870 and 11,795 in 1880.

Schaffhausen (Latinized as *Scaphusa* or *Grescized* into *Probatopolis*) first appears in the 9th century, and had already attained the rank of an imperial city in 1284.

SCHALOKEN, GODFRIED (1643–1706), genre and portrait painter, was born at Dort in 1643, and studied under Van Hoogstraten, and afterwards under Gerhard Douw, whose works his earlier genre-pictures very closely resemble. He visited England and painted several portraits, of which the half-length of William III., now in the Museum, Amsterdam, is a good example. In this work he shows an effect of candle-light, which he also introduced—frequently with fine effect—in many of his subject-pictures. These may be studied in the collections at Buckingham Palace, the Louvre, Vienna, and Dresden. He executed several Scriptural subjects—such as that of the Wise and Foolish Virgins, at Munich—of very indifferent merit. He died at The Hague in 1706.

SCHAMYL (*i.e.*, SAMUEL), prophet and hero of the Caucasian mountaineers, was born in 1797. See CAUCASUS, vol. v p. 258. After his defeat and capture he passed ten years in Russia, where he was well treated. In 1870 he went on pilgrimage to Mecca, and died at Medina in March of the following year.

SCHANDAU, a small town of Saxony, is situated on the right bank of the Elbe, at the mouth of the little valley of the Kirsitzsch, 21 miles to the south-east of Dresden, and 4 miles from the Bohemian frontier. Its position in the heart of the romantic "Saxon Switzerland" gives it an importance to which on other grounds it is not entitled, and thousands of tourists make it their headquarters in summer. The stationary population in 1880 was 3301.

SCHARNHORST, GERHARD JOHANN DAVID VON (1756–1813), Prussian general, celebrated as the author of the so-called "Krimpersystem," or short-service system (see vol. ii p. 594), by which the Prussian nation was prepared for the war of liberation, was a Hanoverian by birth, and served in the Hanoverian army from 1778 to 1801, when he passed into Prussian service, and soon became the leader in the reconstruction of its forces. In the war with France in 1813 he accompanied Blücher as

chief of the general staff, but received a severe wound in the first battle (Grossgörschen), which soon after was followed by his death. The first part of an extensive and important biography of Scharnhorst by Lehmann has recently appeared (Leipzig, 1886).

SCHASSBURG (Hung. *Szegvár*), chief town of the Transylvanian county of Nagy-Kukullo, Hungary, stands on the river Nagy-Kukullo, 24 miles east-south-east of Maros-Vásárhely, in 46° 10' N lat., 24° 47' E long. It consists of two parts,—the one which formerly served as a fortress on the top of a hill, and the other in the valley below,—the two being connected by a covered passage. Schassburg is the seat of various public offices and of a district court of justice, its other institutions include a Franciscan convent, a Protestant upper gymnasium, a teachers' institute and seminary, two savings banks, a free library, hospital, barracks, &c. As a station on the eastern system of the Hungarian State Railways, Schassburg has a good woollen and linen trade, as well as exports of wine and fruit. Among its principal buildings an old Gothic church and the lofty town-hall are specially worthy of mention. The population in 1884 amounted to 8810, the majority being Germans (Saxons), and the remainder Roumanians and Hungarians.

Schassburg was founded by Saxon colonists at the end of the 12th century, its Latin name was *Castrum Sæ*. The most important event in its history was the battle on the 31st July 1849, in which the Hungarian army under Bem was defeated by the overwhelming numbers of the Russian General Ludes. The great national poet, Petöfi, was last seen, and is generally believed to have met his end, in this engagement.

SCHAUMBURG-LIPPE. See LIPPE.

SCHÉELE, KARL WILHELM (1742–1786), an eminent chemist, was born at Stralsund, the capital of Pomerania, which then belonged to Sweden, on the 19th December 1742. His father was a merchant, and Karl Wilhelm was the seventh of a family of eleven. In due time the boy was sent to school, but he did not care for the languages, and as he showed a strong taste for pharmacy he was apprenticed at the age of fourteen to an apothecary in Gothenburg, called Bauch, with whom he stayed for eight years. He was thoughtful and silent, and very punctual and precise in discharge of his duties. His spare time and great part of his nights were devoted to the experimental examination of the different bodies which he dealt with, and the careful study of the standard works on chemistry. By these means he acquired a large store of knowledge and great practical skill and manipulative dexterity. In 1765 he removed to Malmö, and resided for five years with Kälstrom, an apothecary, whence he removed to Stockholm, to Scharenberg, also an apothecary. While here he wrote out an account of his experiments with cream of tartar, from which he had isolated tartaric acid, and sent it to Bergman, the leading chemist in Sweden. Bergman somehow neglected it, and this caused for a time a reluctance on Scheele's part to become acquainted with that savant, but the paper, through the instrumentality of Retzius, was ultimately communicated to the Academy of Sciences at Stockholm. In 1771 Scheele finished an elaborate inquiry into the composition of the beautiful mineral fluor-spar, and showed that it consisted of lime and a peculiar acid which he called fluor acid. He misunderstood, however, the true character of the decomposition he had effected, and gave an erroneous explanation of it. His experiments had been conducted in glass vessels, and he was not aware that what he actually got was the fluo-silicic acid. This mistake was subsequently pointed out and corrected by some other chemists. He left Stockholm in 1773 and took up his residence at Upsala. Here he made the acquaintance of Gahn, assessor of mines at Fahlun, through whose mediation he was at length introduced to

Bergman, the two soon became excellent friends. In 1774 Scheele published his epoch-making investigation into the black oxide of manganese, which had occupied him for two or three years, and in 1775 his memoirs on benzoic and arsenic acids. In the same year he left Upsala, in order to settle at Köping, a small place at the western extremity of Lake Mälär. Having heard that an apothecary's shop was vacant, he applied for it, passed a brilliant examination before the medical college, and was appointed. But, instead of a small flourishing business, he found that he had to face confusion and debt. Undismayed he set to work, introduced order and some prosperity, and in two years bought the business from the widow of the former proprietor. During this unfortunate period Scheele must have worked very hard, for in spite of debt and difficulties he published in 1777 his treatise upon *Air and Fire*, one of the most remarkable books in the whole range of chemical literature, whether its originality, its close reasoning, the number of discoveries which it contains, or the enormous amount of experimental work it represents be considered. About this time Bergman obtained for him from the Academy a grant, Scheele's appreciation of which was shown by his reserving one-sixth for his personal wants and devoting the remainder to his experiments.

Subsequent to this period, and for the remaining nine years of his life, the only events to be recorded are the papers which he composed. Every year he published two or three, and almost every one contained a capital discovery, either the explanation of a phenomenon or reaction previously misunderstood or the description of some new compounds. He was at the zenith of his now European fame as a profound chemist and unflinching experimenter, and in the best years of his life, when his career was suddenly arrested. The common account is that his unremitting work, especially at night, exposing him to cold and draughts, induced a rheumatic attack, to which in the course of a couple of months he succumbed. Possibly his strength had been exhausted by long years of privation and neglect of himself. He had intended, as soon as his circumstances should enable him, to marry the widow of his predecessor. His illness, however, increased very fast, and it was on his death-bed that he carried out his design on the 18th May 1786. Two days later he died, bequeathing to his wife what property he had acquired. He was only forty-four years of age.

The discoveries with which Scheele enriched chemistry are numerous and important. Reference has been already made to the discovery of tartaric acid and of the composition of fluor-spar. The analysis of manganese oxide in 1774 led him to the discovery of chlorine and of baryta (*terra ponderosa*, as it was called), to individualizing the salts of manganese itself, including the green and purple compounds with potash, and to the explanation of how manganese colours and decolourises glass. In 1776 he showed how to prepare benzoic acid by precipitating it from a solution in lime, and he investigated arsenic acid and its reactions with different substances, discovering arsenuretted hydrogen and the green colour "Scheele's green"—a process for preparing which on the large scale he published in 1778. Other researches of this period were concerned with the nature of quartz, clay, and alum, and with an animal concretion or calculus from which he got for the first time uric acid.

The treatise on *Air and Fire* appeared in 1777. It is unnecessary now to enter into Scheele's argument, for, however admirably it was worked out, it started from an erroneous basis, and it is equally impossible in limited space even to enumerate the experiments and the discoveries which fill this book, and which have remained as permanent acquisitions to science through all subsequent changes of theory. Among the most important of these is his demonstration that the air consists mainly of two gases,—one which supports the burning of bodies, the other which prevents it. Thus he showed both analytically and synthetically his "empyreal," or "fire-air," or oxygen, he obtained for his synthesis from acid of nitre, from saltpetre, from black oxide of manganese, and from several other bodies. After the discovery of this substance Scheele applied it to account for a great number of actions, and especially for its function in respiration and the growth of plants. He went through a long

series of actions, seemingly the most diverse in character, trying to bring them under one general law and making at every step the most acute and far-reaching observations and discovering new compounds and new reactions. Thus he innocently made and described sulphuretted hydrogen gas, and he explained the chemical effect of light upon compounds of silver and of other substances.

In 1778 he proposed a new method of making camolene and powder of algaroth. He also examined a mineral, *molybdanum nitens*, which had been supposed to contain lead, but which he showed was quite distinct, and he got from it molybdic acid. He demonstrated in 1779 that plumbago consists almost solely of carbon, and he published a record of estimations of the amount of pure air, $\frac{1}{2}$ of oxygen, contained in the atmosphere, which he had carried out daily during the entire year of 1778. In 1780 he showed that the acidity of sour milk was due to a peculiar acid, now called lactic acid, and from milk sugar, by boiling it with nitric acid, he obtained mucic acid. His next discovery, in 1781, was the composition of tungsten, since called scheelite, which he found consisted of lime combined with a peculiar acid—tungstic acid. The following year he examined the mode of producing ether, and in 1783 discovered glycerin, the sweet principle of fats and oils. In 1782–1783 appeared a research which—of all those Scheele conducted—exhibits his experimental genius at its very best. By a wonderful succession of experiments he showed that the colouring matter of Prussian blue could not be produced without the presence of a substance of the nature of an acid, to which was ultimately given the name of prussic acid. He showed how this body was composed, described its properties and compounds, and mentioned its small and taste, utterly unavailing of any chemical action, but a study of Scheele's own memoir can give an adequate notion of the manner in which he attacked and solved a problem so difficult and complicated as this was at the period in the history of chemistry when Scheele lived. In 1784–85–86 he returned to the subject with which he had begun his career, that of the vegetable acids, and described four new ones—citric, malic, oxalic, and gallic acids.

The preceding is a bare list of the more prominent of Scheele's discoveries, for it must be remembered that he was not merely the first to prepare these bodies, but that he made all the compounds of them possible at the time and explained the conditions under which he produced them. Notable as is the list, and of supreme importance as are most of the bodies themselves, no conception can be gathered from it of Scheele's immense power of experimental research, as no man that has seldom been equaled. His natural endowments were cultivated by unvaried practice and undivided attention, for scientific work was at once his occupation and his relaxation. To appreciate this fully his own account of his researches must be studied. It will thus be seen that his discoveries were not made at haphazard, but were the outcome of experiments carefully planned to substantiate the accuracy of theoretical views at which he had arrived. He thus saved himself unnecessary labour, his experiments told decisively on the question at issue, and he reached his conclusions by the shortest and simplest means. At the same time he left nothing in doubt if experiment would establish it, he grudged no labour to make the truth indisputable, and he evidently never considered his work complete about any body unless he could both unmake and remake it. For him chemistry was both an analytic and a synthetic science, and he shows this prominently in his researches on Prussian blue.

His accuracy, qualitative and quantitative—considering his primitive apparatus, his want of assistance, his place of residence, the undeveloped state of chemical and physical science,—was unrivalled. The work he executed laid hardly anything to be added to it: it was as thoroughly done as it was in the power of an all-consciousness man to do. The one aim of Scheele's life—and he never swayed from it—was the experimental discovery of the truth in nature. Like many other short-lived men of genius he compressed into his few years an amount of work of the greatest originality, but how he managed to do it is a mystery to the less-gifted. What he might have achieved had he lived a little longer can only be surmised, but it may be supposed that, under the newer theory of combustion to which he himself had unwittingly contributed so much, he would have made certainly no fewer and no less important discoveries than those which were the outcome of his erroneous predecessor.

Scheele's papers appeared first in the *Transactions of the Swedish Academy of Sciences*, in Gellé's *Nuove Entdeckungen und Annalen*, and in other periodicals. A list of them is given in Fuchs's *Repertorium der chemischen Literatur*, Bonn, 1800–1806. In Kopp's *Repertorium Chemico-physics*, vol. ii., Göttingen, 1803, and in Poggendorff's *Biographisch-literarisches Handwörterbuch*, Leipzig, 1805. They were collected and published in French, English, Latin, and German. *Mémoires de Chimie*, 2 vols., Paris, 1785–86. *Chemical Essays*, by Thomas Beddoes, 1 vol., London, 1789. *Opuscula*, translated by Schöler, edited by Hahnemann, 2 vols., Leipzig, 1785–86. *Sammelte Werke*, edited by Hahnemann, 2 vols., Berlin, 1789. *The Treatise on Air and Fire* appeared in German, Upsala and Leipzig, 1777, and again in 1778, in English, by J. R. Forsler, London, 1780, in French, by Dietrich, Paris, 1781.

(J F)

SCHEEFFER, ARY (1795–1855), Dutch painter, who was born at Dort on 10th February 1795, represents the senti-

mental phase of the Romantic movement in France. After the early death of his father, a poor painter, Ary was taken to Paris and placed in the studio of Guérin by his mother, a woman of great energy and character. The moment at which Scheffer left Guérin coincided with the commencement of the Romantic movement. He had little sympathy with the directions given to it by either of its most conspicuous representatives, Sigalon, Delacroix, or Géricault, and made various tentative efforts—Gaston de Foix (1824), Sulist Women (1827)—before he found his own path. Immediately after the exhibition of the last-named work he turned to Byron and Goethe, selecting from *Faust* a long series of subjects which had an extraordinary vogue. Of these, we may mention Margaret at her Wheel, Faust Doubting, Margaret at the Sabbath, Margaret Leaving Church; the Garden Walk; and lastly, perhaps the most popular of all, Margaret at the Well. The two Mignons appeared in 1836, and Francesca da Rimini, which is on the whole Scheffer's best work, belongs to the same period. He now turned to religious subjects: Christus Consolator (1836) was followed by Christus Remunerator, the Shepherds Led by the Star (1837), The Magi Laying Down their Crowns, Christ in the Garden of Olives, Christ Bearing his Cross, Christ Interred (1845), St Augustine and Monica (1846), after which he ceased to exhibit, but, shut up in his studio, continued to produce much which was first seen by the outer world after his death, which took place at Argenteuil on the 15th June 1858. At the posthumous exhibition of his works there figured the Sorrows of the Earth, and the Angel Announcing the Resurrection, which he had left unfinished. Amongst his numerous portraits those of La Fayette, Béranger, Lamartine, and Marie Amélie were the most noteworthy. His reputation, much shaken by this posthumous exhibition, was further undermined by the sale of the Paturel Gallery, which contained many of his most celebrated achievements, the charm and facility of their composition could not save them from the condemnation provoked by their poor and earthy colour and vapid sentiment. Scheffer, who married the widow of General Baudrand, was only made commander of the Legion of Honour in 1848,—that is, after he had wholly withdrawn from the Salon. His brother Henri, born at The Hague 27th September 1798, was also a fertile painter.

See Vite's notice prefixed to Bingham's publication of works of A. Scheffer, Etex, *Ary Scheffer*, Mrs Grote, *Life of A. Scheffer*, Julius Meyer's *Geschichte der französischen Kunst*.

SCHELDIT, or SCHELDE (Fr. *Escaut*, Lat. *Scaldis*, O. Dutch *Schoude* or *Schouwe*), a river of north-west Europe, belonging for 75 miles of its course to France, 137 to Belgium, and 37 to the Netherlands. Rising at a height of 295 feet above the sea, in a small lake (7 square miles) at the old abbey of St Martin, near Catelet, in the French department of Aisne (Picardy), it becomes navigable by the junction of the St Quentin Canal, below Catelet, and passes by Cambray, Denain (where it receives the Selle), Valenciennes, at the mouth of the Ronelle, Condé, at the mouth of the Haine or Henne, and Château l'Abbaye, at the mouth of the Scarpe. Entering Belgium between Mortagne and Hollan, it continues by Fontenoy, Tournay, and Oudenarde to Ghent, where it is joined by the Lys from the left, and by the canals which unite this town with Sas and Bruges. At Ghent the tide rises 3½ feet and lasts for four hours, and it would ascend much farther were it not for sluices. But the river, instead of proceeding straight towards the sea, as it appears to have done perhaps as late as the time of Charlemagne, makes a great bend towards the east to Dendermonde (the mouth of the Dender) and Antwerp, whence it again turns north-west and loses itself in the estuaries among the islands of

Zealand. The whole of the lowlands to the north of Ghent are so intersected with canals, and the natural channels are so intermingled with those partially or entirely artificial, that it is impossible to discover with certainty what has been the real history of the lower course of the Scheldt. The Hont or Western Scheldt, the principal estuary by which nearly all Belgium commerce is conveyed, was probably opened up by a storm in 1173 and about 1058 must have been a mere narrow creek. The Eastern Scheldt, which then received most of the river, has gradually diminished in importance, and since the construction of the railway bridge across it between the mainland and South Beveland in 1867 has become completely obstructed with sands. At Antwerp the depth at high water is 49 feet.

Between 1648 and 1793 the Dutch closed the mouths of the Scheldt against foreign commerce. The emperor Joseph of Austria, at that time ruler of Antwerp, protested against this action in 1783, but in 1784, by the treaty of Fontainebleau, he recognized, in return for concessions of territory and 9½ million florins, the right of the Dutch to adhere to the terms of the peace of Westphalia. In 1792 by conquest of Dumouriez, and in 1795 by treaty between France and Holland, the Scheldt was declared open. During the union of Holland and Belgium the question naturally lay in abeyance. When Belgium became independent (1839) Holland so far resumed her exclusive policy, but in 1868 the dues which she was allowed to levy by the treaty of separation were capitalized by Belgium paying 17,141,640 florins, a sum which was largely repaid to Belgium by twenty other countries who felt they had an interest in the free navigation of the Scheldt. Great Britain's share was 8,782,520 francs.

Belge de Géog.*, 1875.

SCHELLING, FRIEDRICH WILHELM JOSEPH VON (1775–1854), a distinguished German philosopher, was born on 27th January 1775 at Leonberg, a small town of Wurtemberg, otherwise notable as scene of the early years of Kepler's life. Through both parents he was connected with families of distinction in the Protestant church community. His father, a solidly trained scholar of Oriental languages, was called in 1777 as chaplain and professor to the cloister school of Bebenhausen, near Tübingen, a preparatory seminary for intending students of theology at Tübingen. Here Schelling received his earliest education and gave the first evidences of what afterwards so eminently distinguished him, remarkable precocity and quickness of intellect. From the Latin school at Nürtingen, whither he had been sent in his tenth year, he was returned in two years as having already acquired all the school could give him, and his father with regret was compelled to allow him at so abnormally young an age to study with the seminarists at Bebenhausen. In 1790, with special permission, for he was yet three years under the prescribed age, Schelling entered the theological seminary at Tübingen, where he had as fellow students, contemporary as scholars though elder in years, Hegel and Holderlin. The character and direction of his studies may be gathered sufficiently from the titles of the essays which for various purposes were accomplished during the five years of his student career. In 1792 he graduated in the philosophical faculty with a thesis *Antiquissimum de prima motorum humanorum origine philosophematis explicandis tentamen criticum et philosophicum*, in 1793 he contributed to Paulus's *Memorabilien* a paper *Ueber Mythos, historische Sagen, und Philosophie der ältesten Welt*; and in 1795 his thesis for his theological degree was *De Marcione Paulinarum epistoliarum emendatore*. The influence of these early studies over his later literary career

¹ Bylandt, Belpaire, Renaud, and Wauvermans impugn, and Des Roches, Viquan, Van Remondack and Verstraete maintain, the existence within historic times of a direct main-river channel from Ghent northward to the sea.

has been often exaggerated, but doubtless they contended to strengthen his natural tendency to dwell rather on the large historico-speculative problems than on the difficulties of abstract thinking. Before the date of his last essay noted above, a new and much more important influence had begun to operate on him. In conjunction with some of his fellow-students he was in 1793 studying the Kantian system. The difficulties or imperfections of that system he claims soon to have perceived, and no doubt the perception was quickened by acquaintance with the first of those writings in which Fichte put forward his amended form of the critical philosophy. The "Review of *Ænesidemus*" and the treatise *On the Notion of Wissenschaftslehre* found in Schelling's mind most fruitful soil. With characteristic zeal and impetuosity Schelling had no sooner grasped the leading ideas of Fichte's new mode of treating philosophy than he threw together the thoughts suggested to him in the form of an essay, which appeared, under the title *Ueber die Möglichkeit einer Form der Philosophie überhaupt*, towards the end of 1794. There was nothing original in the treatment, but it showed such power of appreciating the new ideas of the Fichtean method that it was hailed with cordial recognition by Fichte himself, and gave the author immediately a place in popular estimation as in the foremost rank of existing philosophical writers. The essay was followed up in 1795 by a more elaborate writing, *Von Ich als Prinzip der Philosophie, oder über das Unbedingte im menschlichen Wissen*, which, still remaining within the limits of the Fichtean idealism, yet exhibits unmistakable traces of a tendency to give the Fichtean method a more objective application, and to amalgamate with it Spinoza's more realistic view of things.

The reputation so quickly gained led soon to its natural result. In midsummer 1798 Schelling was called as extraordinary professor of philosophy to Jena, and thus stepped into the most active literary and philosophical circle of the time. The intervening period had not been unfruitful. While discharging for two years at Leipzig the duties of companion or tutorial guardian to two youths of noble family, Schelling had contributed various articles and reviews to Fichte and Niehammer's *Journal*, and had thrown himself with all his native impetuosity into the study of physical and medical science. From 1796 date the *Briefe über Dogmatismus und Kriticismus*, an admirably written critique of the ultimate issues of the Kantian system, which will still repay study; from 1797 the essay entitled *Neue Deduction des Naturrechts*, which to some extent anticipated Fichte's treatment in the *Grundlage des Naturrechts*, published in 1796, but not before Schelling's essay had been received by the editors of the *Journal*. The reviews of current philosophical literature were afterwards collected, and with needful omissions and corrections appeared under the title "Abhandlungen zur Erläuterung des Idealismus der Wissenschaftslehre" in Schelling's *Philos. Schriften*, vol. i, 1809. The studies of physical science bore rapid fruit in the *Ideen zu einer Philosophie der Natur*, 1797, and the treatise *Von der Weltseele*, 1798, the drift of which will be noted later.

Schelling's professoriate in Jena lasted till the early part of 1803. His lectures were extraordinarily attractive, his productive powers were at their best; and the circumstances of his surroundings developed forcibly the good and evil qualities of his character. Of his writings during this period a merely chronological notice will meanwhile suffice. In 1799 appeared the *Erster Entwurf eines Systems der Naturphilosophie*, with an independent and subsequent *Ergänzung*, in 1800 the *System des transcendentalen Idealismus*, in form one of the most finished, in substance one of the most satisfactory of his works, in

the same year, in the *Zeitschrift für speculative Physik*, edited by him, "Allgemeine Deduction des dynamischen Processes", and in 1801 the *Darstellung meines Systems der Philosophie*, in 1802, in the *Neue Zeitschrift für spec. Physik*, the "Fernere Darstellungen aus dem System der Philosophie", also in 1802 the dialogue *Bruno* and the excellently written *Vorlesungen über die Methode des akademischen Studiums*. In conjunction with Hegel, who in 1801 at Schelling's invitation had come to Jena, he edited the *Kritisches Journal für Philosophie*, the greater part of which was written by Hegel. Regarding the authorship of certain articles in the volume and a half of this *Journal* a discussion of no great significance has arisen, concerning which perhaps the best statement is that by Schelling's son in the preface to vol. v of the *Sämmtliche Werke*, Abth. i.

The philosophical renown of Jena reached its culminating point during the years of Schelling's residence there, in no small measure through the imposing force of his character and teaching. Recognized as of the first rank among living thinkers he was received with every mark of distinction, and his intellectual sympathies soon united him closely with some of the most active literary tendencies of the time. With Goethe, who viewed with interest and appreciation the poetical fashion of treating fact characteristic of the *Naturphilosophie*, he continued on excellent terms, while on the other hand he was repelled by Schiller's less expansive disposition, and failed altogether to understand the lofty ethical idealism that animated his work. By the representatives of the Romantic school, then in the height of their fervour and beginning their downward course, he was hailed as a most potent ally, and quickly became *par excellence* the philosopher of the Romantic type. The Schlegels and their friends, who had found at least one fundamental principle of Romantic strain in Fichte, had begun to be dissatisfied with the cold and abstract fashion of viewing nature that seemed necessarily to follow from the notion of the *Wissenschaftslehre*, and at the same time the deep-seated antagonism of character between Fichte and the impetuous literateurs of the Romantic school was beginning to be felt. In Schelling, essentially a self-conscious genius, eager and rash, yet with undeniable power, they hailed a personality of the true Romantic type, and in his philosophy a mode of conceiving nature adequate to the needs of poetic treatment. During the Jena period the closest union obtained between Schelling and those who either at Jena or at Berlin carried on warfare for the Romantic idea. With August Wilhelm Schlegel and his gifted wife Caroline, herself the embodiment of the Romantic spirit, Schelling's relations were of the most intimate kind. Personal acquaintance made at Dresden before Schelling began his professional career at Jena rapidly developed into a warm friendship, to which circumstances soon gave a new and heightened colour. Caroline Schlegel, a woman of remarkable receptive and appreciative power, emotional to excess, and full of the ardent ill-balanced sympathies that constituted the Romantic tone, felt for Schelling unbounded admiration. In him she found the philosophic view which gave completeness and consistency to the tumultuous literary and personal feelings that animated her, and she was not less attracted by the dominating force of his personal character. It is probable that in the early stages of their friendship a future marriage between Schelling and Caroline's young daughter, Auguste Bohmer, was, if not definitely understood, yet vaguely contemplated by both, and that in consequence neither was fully aware of the nature of the feelings springing up between them. The untimely death of Auguste in the summer of 1800, a death in which Schelling's rash confidence in his medical knowledge was unfor-

tunately involved, while a severe blow to both, drew them much more closely together, and in the following year, A. W. Schlegel having removed to Berlin, and Caroline remaining in Jena, affairs so developed themselves that quietly, amicably, and in apparently the most friendly manner, a divorce was arranged and carried to its completion in the early summer of 1803. On the 2d June of the same year Schelling and Caroline, after a visit to the former's father, were married, and with the marriage Schelling's life at Jena came to an end. It was full time, for Schelling's undoubtedly overweening self-confidence and most arrogant mode of criticism had involved him in a series of virulent disputes and quarrels at Jena, the details of which are in themselves of little or no interest, but are valuable as illustrations of the evil qualities in Schelling's nature which deface much of his philosophic work. The boiling fervour which the Romantics prized is deplorably ineffective in the clear cold atmosphere of speculation.

A fresh field was found in the newly-constituted university of Würzburg, to which he was called in September 1803 as professor of "Naturphilosophie," and where he remained till April 1806, when the Napoleonic conquests compelled a change. The published writings of this period (*Philosophie und Religion*, 1804, and *Ueber das Verhältniss des Realen und Idealen in der Natur*, 1806), and still more the unpublished draft of his lectures as continued in volumes v and vi of the *Sammliche Werke*, exhibit an important internal change in his philosophic views, a change which was accentuated by the open breach on the one hand with Fichte and on the other hand with Hegel. Schelling's little pamphlet *Darlegung des wahren Verhältnisses der Naturphilosophie zur verbesserten Fichteschen Lehre* was the natural sequel to the difference which had brought the correspondence of the former friends to a close in 1803, and to Fichte's open condemnation in the *Grundzüge d. gegenwärt. Zeitalters*. Hegel's preface to the *Phänomenologie des Geistes* was in like manner the sequel to the severe treatment which in his Jena lectures he had bestowed on the emptiness of the Schellingian method, and with the appearance of that work correspondence and friendship between the two ceased, and in Schelling's mind there remained a deeply rooted sense of injury and injustice.

The Würzburg professoriate had not been without its inner trials. Schelling had many enemies, and his irreconcilable and lofty tone of dealing with them only increased the virulence of their attacks. He embroiled himself with his colleagues and with the Government, so that it was doubtless with a sense of relief that he found external events bring his tenure of the chair to a close. In Munich, to which with his wife he removed in 1806, he found a long and quiet residence. A position as state official, at first as associate of the academy of sciences and secretary of the academy of arts, afterwards as secretary of the philosophical section of the academy of sciences, gave him ease and leisure. Without resigning his official position he lectured for a short time at Stuttgart, and during seven years at Erlangen (1820-27). In 1809 Caroline died, and three years later Schelling married one of her closest, most attached friends, Pauline Gotter, in whom he found a true and faithful companion.

During the long stay at Munich (1806-1841) Schelling's literary activity seemed gradually to come to a standstill. The "Aphorisms on Naturphilosophie" contained in the *Jahrbücher der Medicin als Wissenschaft* (1806-8) are for the most part extracts from the Würzburg lectures; and the *Denkmal der Schrift von den göttlichen Dingen des Herrn Jacob* was drawn forth by the special incident of Jacob's work. The only writing

of significance is the "Philosophische Untersuchungen über das Wesen der menschlichen Freiheit," which appeared in the *Philosophische Schriften*, vol. 1 (1809), and which carries out, with increasing tendency to mysticism, the thoughts of the previous work, *Philosophie und Religion*. In 1815 appeared the tract *Ueber die Gottheiten zu Samothrace*, ostensibly a portion of the great work, *Die Weltalter*, on which Schelling was understood to be engaged, a work frequently announced as ready for publication, but of which no great part was ever written. Probably it was the overpowering strength and influence of the Hegelian system that constrained Schelling to so long a silence, for it was only in 1834, after the death of Hegel, that, in a preface to a translation by H. Beckers of a work by Cousin, he gave public utterance to the antagonism in which he stood to the Hegelian and to his own earlier conceptions of philosophy. The antagonism certainly was not then a new fact, the Erlangen lectures on the history of philosophy (*Sammt. Werke*, x 124-5) of 1822 express the same in a pointed fashion, and Schelling had already begun the treatment of mythology and religion which in his view constituted the true positive complement to the negative of logical or speculative philosophy. Public attention, which had been from time to time drawn to Schelling's prolonged silence, was powerfully attracted by these vague hints of a new system which promised something more positive, as regards religion in particular, than the apparent results of Hegel's teaching. For the appearance of the critical writings of Strauss, Feuerbach, and Bauer, and the evident disunion in the Hegelian school itself, had alienated the sympathies of many from the then dominant philosophy. In Berlin particularly, the headquarters of the Hegelians, the desire found expression to obtain officially from Schelling a treatment of the new system which he was understood to have in reserve. The realization of the desire did not come about till 1841, when the appointment of Schelling as Prussian privy councillor and member of the Berlin Academy, gave him the right, a right he was requested to exercise, to deliver lectures in the university. The opening lecture of his course was listened to by a large and most appreciative audience, and thus, in the evening of his career, Schelling found himself, as often before, the centre of attraction in the world of philosophy. The enmity of his old foe H. E. G. Paulus, sharpened by Schelling's apparent success, led to the surreptitious publication of a verbatim report of the lectures on the philosophy of revelation, and, as Schelling did not succeed in obtaining legal condemnation and suppression of this piracy, he in 1845 ceased the delivery of any public courses. No authentic information as to the nature of the new positive philosophy was obtained till after his death in 1854, when his sons began the issue of his collected writings with the four volumes of Berlin lectures—vol. 1, *Introduction to the Philosophy of Mythology* (1856), 2, *Philosophy of Mythology* (1857); 3, and 4, *Philosophy of Revelation* (1858).

Whatever judgment one may form of the total worth of Schelling as a philosopher, his place in the history of that important movement called generally German philosophy is unmistakable and assured. It happened to him, as he himself claimed, to turn a page in the history of thought, and one cannot ignore the actual advance upon his predecessor achieved by him or the brilliant fertility of the genius by which that achievement was accomplished. On the other hand it is not to be denied that Schelling, to whom an unusually long period of activity was accorded, nowhere succeeds in attaining the rounded completeness of scientific system. His philosophical writings, extended over more than half a century, he before us, not as parts of one whole, but as the successive manifestations of a restless highly endowed spirit, striving continuously but unsuccessfully after a solution of its own problems. Such unity as they possess is a unity of tendency and endeavour, they are not parts of a whole, and in some respects the final form they assumed is the least satisfactory of all. Hence it has come about

that Schelling remains for the philosophic student but a moment of historical value in the development of thought, and that his works have for the most part ceased now to have more than historic interest. Throughout his thinking bears the painful impress of hurry, incompleteness, and spasmodic striving after an ideal which could only be attained by patient, laborious, and methodic effort. Brilliant contributions there are without doubt to the evolution of a philosophic idea, but no systematic fusion of all into a whole. It is not unfair to connect the apparent failings of Schelling's philosophizing with the very nature of the thinker and with the historical accidents of his career. In the writings of his early manhood, for example, more particularly those making up *Naturphilosophie*, one finds in painful abundance the evidences of hastily-acquired knowledge, impatience of the hard labour of minute thought, over-confidence in the force of individual genius, and desire instantaneously to present even in crudest fashion the newest idea that has dawned upon the thinker. Schelling was prematurely thrust into the position of a foremost productive thinker, and when the lengthened period of quiet meditation was at last forced upon him there unfortunately lay before him a system which achieved what had thus been unmet in his student and impetuous decades. It is not possible to acquit Schelling of a certain disingeniousness in regard to the Hegelian philosophy, and if we claim for him perfect disinterestedness of view we can do so only by imposing on him the severer condemnation of deficient insight.

It was a natural concomitant of this continuous hurry under which Schelling's successive efforts at constructive work were carried out that he should find at all stages of his development himself by calling to his aid the forms of some other system. The successive phases of his development might without injustice be characterized by reference to these external supports. Thus Fichte, Spinoza, Jakob Boehme and the Mystics, and finally, the great Greek thinkers with their Neoplatonic, Gnostic, and Scholastic commentators, gave respectively colouring to particular works in which Schelling unfolded himself. At the same time it would be unjust to represent Schelling as merely borrowing from these external sources. There must be allowed to him genuine philosophic spirit and no small measure of philosophic insight. Of the philosophic *afflatus* he was in no want, and it might be fairly added that, under all the differences of exposition which seem to constitute so many differing Schellingian systems, there is one and the same philosophic effort and spirit. But what Schelling did want was power to work out adequately, in each particular time, the ideas which his spirit was filled and mastered. Hence he could only find expression for himself in forms of that or that other philosophy, and hence too the frequent formlessness of his own thought, the tendency to relapse into mere impatient despair of ever finding an adequate vehicle for transmitting thought.

It is thus, moreover, a matter of indifference how one distributes or classifies the several forms and periods of Schelling's philosophic activity. Whether one adopts as basis the external form, *i. e.*, the foreign mode of speculation laid under contribution, or endeavours to adhere closely to inner differences of view, the result is very much the same. There is one line of speculative thought, in the development of which inevitable problems call for new methods of handling, while the results only in part can claim to have a place accorded to them in the history of philosophy. It is far in dealing with Schelling's development that we are met with indications of his own opinion regarding its more significant moments. In his own view the turning points seem to have been—(1) the transition from Fichte's method to the more objective conception of nature—the advance, in other words, to *Naturphilosophie*, (2) the definite formulation of that which implicitly, as Schelling claims, was involved in the idea of *Naturphilosophie*, *viz.*, the thought of the identical, indifferent, absolute substratum of both nature and spirit, the advance to *Identitätsphilosophie*; (3) the opposition of negative and positive philosophy, an opposition which is the theme of the Berlin lectures, but the germs of which may be traced back to 1804, and of which more than the germs are found in the work on freedom of 1809. Only what falls under the first and second of the divisions so indicated can be said to have discharged a function in developing philosophy, only so much constitutes Schelling's philosophy proper. A very brief notice of the characteristic features of the three stadia must here suffice.

(1) *Naturphilosophie*—The Fichtean method had striven to exhibit the whole structure of reality as the necessary implication of self-consciousness. The fundamental features of knowledge, whether as activity or as sum of apprehended fact, and of conduct had been deduced as elements necessary in the attainment of self-consciousness. Fichtean idealism therefore at once stood out negatively, as abolishing the dogmatic conception of the two real worlds, subject and object, by whose interaction cognition and practice arise, and as amending the critical idea which retained with dangerous caution too many fragments of dogmatism; positively, as insisting on the unity of philosophical interpretation

and as supplying a key to the form or method by which a completed philosophic system might be constructed. But the Fichtean teaching appeared on the one hand to identify too closely the ultimate ground of the universe of rational conception with the finite, individual spirit, and on the other hand to endanger the *reality* of the world of nature by regarding it too much after the fashion of subjective idealism, as mere moment, though necessitated, in the existence of the finite thinking mind. It was almost a natural consequence that Fichte never succeeded in amalgamating with his own system the æsthetic view of nature to which the *Kritik der Urteilskraft* had pointed as an essential component in any complete philosophy.

From Fichte's position Schelling started. From Fichte he derived the ideal of a completed whole of philosophic conception, from Fichte he derived the formal method to which for the most part he continued true. The earliest writings tended gradually towards the first important advance. Nature must not be conceived as merely abstract limit to the infinite striving of spirit, as a mere series of necessary thoughts for mind. It must be that and more than that. It must have reality for itself, a reality which is at issue in the conflict with its ideal character, a reality the inner structure of which is ideal, a reality the root and spring of which is spirit. Nature as the sum of that which is objective, intelligence as the complex of all the activities making up self-consciousness, appear thus as equally real, as alike exhibiting ideal structure, as parallel with one another. The philosophy of nature and transcendental philosophy are the two complementary portions of philosophy as a whole.

Animate with this new conception Schelling made his hurried rush to *Naturphilosophie*, and with the aid of Kant and of fragmentary knowledge of contemporary scientific movements, threw off in quick succession the *Ideen*, the *Weltseele*, and the *Erster Entwurf*. *Naturphilosophie*, which thus became an historical fact, has had scant mercy at the hands of modern science, and undoubtedly there is much in it, even in that for which Schelling alone is responsible, for which only contempt can be our feeling. Schelling, one must say, had neither the strength of thinking nor the acquired knowledge necessary to hold the balance between the abstract treatment of cosmological notions and the concrete researches of special science. His efforts after a construction of natural reality are bad in themselves and gave rise to a wearisome flood of perfectly useless physical speculation. Yet it would be unjust to ignore the many brilliant and sometimes valuable thoughts that are scattered throughout the writings on *Naturphilosophie*, thoughts to which Schelling himself is but too frequently untrue. Regarded merely as a criticism of the notions with which scientific interpretation proceeds, these writings have still importance and might have achieved more had they been untainted by the tendency to hasty, ill-considered, *a priori* anticipations of nature.

Nature, as having reality for itself, forms one completed whole. Its manifoldness is not then to be taken as excluding its substantial unity, the divisions which our ordinary perception and thought introduce into it have not absolute validity, but are to be interpreted as the outcome of the single formative energy or complex of forces which is the inner aspect, the soul of nature. Such inner of nature we are in a position to apprehend and constructively to exhibit to ourselves in the successive forms which its development assumes, for it is the same spirit, though unconscious, which becomes self-consciousness, and which results in the realization of spirit. Nor is the variety of its forms imposed upon it from without, there is neither external teleology in nature, nor mechanism in the narrower sense. Nature is a whole and forms itself, within its range we are to look for no other than natural explanations. The function of *Naturphilosophie* is to exhibit the ideal as springing from the real, not to deduce the real from the ideal. The incessant change which experience brings before us, taken in conjunction with the thought of unity in productive force of nature, leads to the all-important conception of the duality, the polar opposition through which nature expresses itself in its varied products. The dynamical series of stages in nature, the forms in which the ideal structure of nature is realized, are matter, as the equilibrium of the fundamental expansive and contractive forces, light, with its subordinate processes,—magnetism, electricity, and chemical action, organism, with its component phases of reproduction, irritability, and sensibility.¹

Just as nature exhibits to us the series of dynamical stages of processes by which spirit struggles towards consciousness of itself, so the world of intelligence and practice, the world of mind, exhibits the series of stages through which self-consciousness with its inevitable oppositions and reconciliations develops in its ideal form. The theoretical side of inner nature in its successive grades from sensation to the highest form of spirit, the abstracting reason which emphasizes the difference of subjective and objective, leaves

¹ The briefest and best account in Schelling himself of *Naturphilosophie* is that contained in the *Erstentwurf zum Ersten Entwurf* (§§ IV. u. V.). The fullest and most valid statement of *Naturphilosophie* is that given by K. Fischer in his *Gesch. d. Phil.*, xiii, 433-462.

an unsolved problem which receives satisfaction only in the practical, the individualizing activity. The practical, again, taken in conjunction with the theoretical, forces on the question of the reconciliation between the free conscious organization of thought and the apparently necessitated and unconscious mechanism of the objective world. In the notion of a teleological connexion and in that which for spirit is its subjective expression, viz., art and genius, the subjective and objective find their point of union.

(2) Nature and spirit, *Natur, philosophische und Transcendentalphilosophie*, thus stand as two relatively complete, but complementary parts of the whole. It was impossible for Schelling, the animating principle of whose thought was the conscious man of culture, not to take and to take speedily the step towards the conception of the uniting basis of which nature and spirit are manifestations, forms, or consequences. For this common basis, however, he did not succeed at first in finding any other than the merely negative expression of indifference. The identity, the absolute, which underlay all difference, all the relative, is to be characterized simply as *indifferent*, as absolute undifferentiated self-equivalence. It lay in the very nature of this thought that Spinoza should now offer himself to Schelling as the thinker whose form of presentation came nearest to his new problem. The *Darstellung meines Systems*, and the more expanded and more careful treatment contained in the lectures on *System der gesammten Philosophie und der Naturphilosophie* undertaken given in Würzburg, 1804 (published only in the *Sammlung des Schellings*, 1836, 578 ff. p. 131-578 ff.) are Spinozistic in form, and to a large extent in substance. They are not without value, indeed, as extended commentary on Spinoza. With all his efforts, Schelling does not succeed in bringing his conceptions of nature and spirit into any vital connexion with the primal identity, the absolute indifference of reason. No true solution could be achieved by resort to the mere absence of distinguishing, differentiating feature. The absolute was left with no other function than that of removing all the differences on which thought turns. The criticisms of Fichte, and more particularly of Hegel (in the "Vorrede" to the *Phänomenologie des Geistes*), point to the fatal defect in the conception of the absolute as mere featureless identity.

(3) Along two distinct lines Schelling is to be found in all his later writings striving to amend the conception, to which he remained true, of absolute as the ultimate ground of all that is. It was necessary, in the first place, to give to this absolute a character, to make of it something more than empty sameness, it was necessary, in the second place, to clear up in some way the relation in which the actuality or apparent actuality of nature and spirit stood to the ultimate real. Schelling had already (in the *System der freien Phil.*) begun to endeavour after an amalgamation of the Spinozistic conception of nature and of the Platonic view of an ideal realm, and to find therein the means of enriching the bareness of absolute reason. In *Bruno*, and in *Philos. v. Religion*, the same thought finds expression. In the realm of ideas the absolute finds itself, has its own nature over against itself as objective over against subjective, and thus is in the way of overcoming its abstractness, of becoming concrete. This conception of a difference, of an internal structure in the absolute, finds other and not less obscure expressions in the mystical contributions of the *Menschliche Freiheit* and in the scholastic speculations of the Berlin lectures on mythology. At the same time it connects itself with the second problem, how to attain in conjunction with the abstractly rational character of the absolute an explanation of actuality. Things,—nature and spirit,—have an actual being. They exist not merely as logical consequence or development of the absolute, but have a stubbornness of being in them, an antagonistic feature which in all times philosophers have been driven to recognize, and which they have described in varied fashion. The actuality of things is a defection from the absolute, and their existence compels a reconsideration of our conception of God. There must be recognized in God as a completed actuality, a dim, obscure ground or basis, which can extend but to the form, and touch not the real,—that God is to be conceived as act, as well as something over and above the rational conception of the divine. Hence the stress laid on will as the realizing factor, in opposition to thought, a view through which Schelling connects himself with Schopenhauer and Von Hartmann, and on the ground of which he has been recognized by the latter as the reconciler of idealism and realism. Finally, then, there emerges the opposition of *being*, *essence*, merely rational philosophy, and of *becoming*, of which the content is the real evolution of the divine as it has taken place in fact and in history and as it is recorded in the varied mythologies and religions of mankind. Not much satisfaction can be felt with the exposition of either as it appears in the volumes of Berlin lectures.

Schelling's works were collected and published by his sons, in 14 vols., 1856-61. For the life good materials are to be found in the three vols., *Aus Schellings Leben und Briefen*, 1860-70, in which a biographic sketch of the philosopher's early life is given by his son, and in *Witz, Erinnerungen*, 2 vols. 1871. An interesting little work is Krieger, *Holde, Hagen, u. Schelling in ihren Schicksalen Jugend-Jahre*, 1877. The biography by Krieger Fischer's volume is complete and admirable. Apart from the expositions in the larger histories of modern philosophy, in Meißner, Erdmann, Wilm, and Kuno Fischer, and in Hym's *Romanistische Schule*, valuable studies are—Tönnemann, *Schelling*, 1848, Noack, *Schelling und die Philosophie der Romantik*, 2 vols., 1850, Franz, *Schellings positive Philosophie*, 3 vols., 1859-80, Watson, *Schellings Transcendental Idealism*, 1882. (R. A. D.)

SCHEMnitz (Hung. *Schemenitzbánya*), a mining town in the Cse-Danubian county of Hont, Hungary, lies about 65 miles north from Budapest, in 48° 27' N lat., 18° 52' E. long., on an elevated site, 2300 feet above the level of the sea. Its institutions include a Roman Catholic and a Protestant gymnasium, a high school for girls, a court of justice, a hospital, and several benevolent and scientific societies. Schemnitz owes its chief importance to the fact of its being the mining centre of the kingdom. Connected with this local industry are important Government institutions, such as various mining superintendencies, a chemical analytical laboratory, and an excellent academy of mining and forestry (with a meteorological observatory and a remarkable collection of minerals), attended by pupils from all countries of Europe and also from America. The mines are chiefly the property of the state and the corporation, the average yield annually is—gold, 232 lb., silver, 45,000 lb.; lead, 11,600 cwt.; copper, 180 cwt. Iron, arsenic, &c., to the value of about £150,000 are also produced. There are also flourishing potteries where well-known tobacco pipes are manufactured. With Schemnitz is conjoined the town of Balabánya; their united population in 1884 was 15,263, chiefly Slovaks, of whom nearly 3000 were engaged in mining.

Schemnitz, which was already noted for its mines in the time of the Romans, has played considerable part in the history of Hungary. The archives of the town contain many interesting documents. After the Tartar invasion in the 12th century it was colonized by Germans, but had become quite Slavonized before the academy of mining was founded by Maria Theresia (1780). The school of forestry was added in 1808. The corporation is wealthy, having received special commercial privileges from the crown in consideration of pecuniary aid afforded in times of emergency.

SCHENECTADY, a city of the United States, county seat of Schenectady county, New York, in the valley of the Mohawk river, 17 miles by rail north-west of Albany, with which it is also connected by the Erie Canal. It is best known as the seat of Union College, an institution founded in 1795 by a union of several religious sects, and now possessed of large endowments, extensive buildings, and a valuable library, and along with the Albany medical and law schools, &c., forming the Union University. Besides manufacturing locomotives, iron bridges, and agricultural implements, Schenectady has shawl, hosiery, carriage, and varnish factories. The population was 9579 in 1860, 11,026 in 1870, and 13,555 in 1880.

Occupying the site of one of the cornel grounds of the Mohawks, Schenectady was chosen as a Dutch trading post in 1620, was chartered in 1684, and became a borough in 1765 and a city in 1798. In 1691 it was burned by the French and Indians, and sixty-three of its inhabitants massacred.

SCHETKY, JOHN ALEXANDER (1785-1824), a younger brother of J. C. Schetky (see below), studied medicine in Edinburgh university and drawing in the Trustees' Academy. As a military surgeon he served with distinction under Lord Beresford in Portugal. He contributed excellent works to the exhibitions of the Royal Academy and of the Water-Colour Society, and executed some of the illustrations in Sir W. Scott's *Provincial Antiquities*. He died at Cape Coast Castle, 5th September 1824, when preparing to follow Mungo Park's route of exploration.

SCHETKY, JOHN CHRISTIAN (1778-1874), marine painter, descended from an old Transylvanian family, was born in Edinburgh on the 11th of August 1778. He studied art under Alexander Nasmyth, and after having

travelled on the Continent he settled in Oxford, and taught for six years as a drawing-master. In 1808 he obtained a post in the military college, Great Marlow, and three years later he received a congenial appointment as professor of drawing in the naval college, Portsmouth, where he had ample opportunities for the study of his favourite marine subjects. From 1836 to 1855 he held a similar professorship in the military college, Addiscombe. To the Royal Academy exhibitions he contributed at intervals from 1805 to 1872, and he was represented at the Westminster Hall competition of 1847 by a large oil-painting of the Battle of La Hogue. He was marine painter to George IV, William IV, and Queen Victoria. Among his published works are the illustrations to Lord John Manners's *Cruise in South Waters*, and a volume of photographs from his pictures and drawings issued in 1867 under the title of *Veterans of the Sea*. He died in London, on the 28th of January 1874.

One of his best works, the Loss of the Royal George, painted in 1840, is in the National Gallery, London, and the United Service Club possesses another important marine subject from his brush. His memoir by his daughter was published in 1877.

SCHEVENINGEN, a fishing village and watering-place in Holland, on the North Sea, about two miles from The Hague, with which it is connected by a shaded avenue with a tramway. There is a fine sandy beach below the line of dunes that separate the village from the sea. The terrace crowning the dunes serves as a promenade. Population in 1879, 7713. Scheveningen has a considerable herring fleet. In a naval engagement off the coast in 1673 De Ruyter defeated the combined forces of the French and English.

SCHIAVONETTI, LUIGI (1765-1810), engraver, was born at Bassano in Venetia, on April 1, 1765. After having studied art for several years he was employed by Testolini, an engraver of very indifferent abilities, to execute imitations of Bartolozzi's works, which he passed off as his own. In 1790 Testolini was invited by Bartolozzi to join him in England, and it having been discovered that Schiavonetti, who accompanied him, had executed the plates in question, he was taken by Bartolozzi into his employment, and, having greatly improved under his instruction, he became an eminent engraver in both the line and the dot manner, "developing an individual style which united grandeur with grace, boldness, draughtsman-like power, and intelligence with executive delicacy and finish." Among his early works are four plates of subjects from the French Revolution, after Benzeach. He also produced a Mater Dolorosa after Vandyck, and Michelangelo's cartoon of the Surprise of the Soldiers on the Banks of the Arno. From 1805 to 1808 he was engaged in etching Blake's designs to Blair's *Grave*, which, with a portrait of the artist engraved by Schiavonetti after T. Phillips, R.A., were published in the last-named year. The etching of Stothard's Canterbury Pilgrims was one of his latest works, and on his death on the 7th of June 1810 the plate was taken up by his brother Nicolo, and finally completed by James Heath.

SCHIEDAM, a town of the Netherlands, in the province of South Holland, not far from the confluence of the Schie with the Maas, 3 miles by rail from Rotterdam. It is best known as the seat of a great gun manufacture, which, carried on in more than two hundred distilleries, gives employment besides to malt-factories, cooperages, and cork-cutting establishments, and supplies grain refuse enough to feed about 30,000 pigs. Other industries are ship-building, glass-blowing, and candle-moulding. Schiedam, which has recently been growing rapidly towards the south-west in the Nieuw-Frankland, is not behind the larger of the Netherlands cities in the magnificence of its private

residences, but none of its public buildings are of much note. It is enough to mention the Groote or Jans-Kerk, with the tomb of Cornelis Haga, ambassador to Turkey, the old Roman Catholic church, the synagogue, the town-house, the exchange, the Musus Sacrum, the post office (Blaauwhuis), and a ruined castle (Huis te Riviere). The population of the commune increased from 9157 in 1811 to 12,360 in 1840, 21,103 in 1873, 23,035 in 1880, and 24,321 in 1884; the population of the town was 18,854 in 1870.

Schiedam, which first appears in a document of 1264, obtained privileges from Floris V in 1276, and gradually acquired importance as a commercial town. In the 16th century it had a considerable share in the herring fishery and carried on salt-making, brick-making, and weaving, and began to turn its attention to distilling. The town was flooded in 1775.

SCHIEFNER, FRANZ ANTON (1817-1879), linguist, was born at Reval, in Russia, on the 18th July 1817. His father was a merchant who had emigrated from Bohemia at the end of last century. He received his education at the grammar school of his native place, where also his subsequent colleague, the celebrated naturalist Karl Ernst von Baer, had been brought up. He matriculated at St Petersburg as a law student in 1836, but while qualifying for this profession he pursued with keen interest the study of the classics, and subsequently devoted himself at Berlin, from 1840 to 1842, exclusively to Eastern languages. On his return to St Petersburg in 1843 he was employed in teaching the classics in the First Grammar School, and soon afterwards received a post in the Imperial Academy, where in 1852 the cultivation of the Tibetan language and literature was assigned to him as his special function. Simultaneously he held from 1860 to 1873 the professorship of classical languages in the Roman Catholic theological seminary. From 1854 till his death he was an extraordinary member of the Imperial Academy. He died after a fortnight's illness on the 16th November 1879.

Schiefner made his mark in literary research in three directions. First, he contributed to the *Memoirs* and *Bulletin* of the St Petersburg Academy, and brought out independently, a number of valuable articles and larger publications on the language and literature of Tibet. He possessed also a remarkable acquaintance with Mongolian, and when death overtook him had just finished a revision of the New Testament in that language with which the British and Foreign Bible Society had entrusted him. Further, he was one of the greatest authorities on the philology and ethnology of the Finnic tribes. He edited and translated the great Finnish epic *Kalevala*, he arranged, completed, and brought out in twelve volumes the literary remains of Alexander Castrén, bearing on the languages of the Samoyedic tribes, the Korbai, Kargass, Tungusian, Buryat, Ostiak, and Ketnic tongues, and prepared several valuable papers on Finnic mythology for the Imperial Academy. In the third place, he made himself the exponent of recent investigations into the languages of the Caucasus, which, thanks to his lucid analyses, have now been placed within reach of European philologists. Thus he gave a full analysis of the Tush language, and in quick succession, from Baron P. Uslar's investigations, comprehensive papers on the Avar, Udi, Abkhazian, Tschetchelez, Kas-Kumuk, Hurkanian and Kurman languages. He had also completely mastered the Ossetic, and brought out a number of translations from that language, several of them accompanied by the original text. For many of his linguistic investigations he had, with as much tact as patience, availed himself of the presence in St Petersburg of natives (soldiers chiefly) of the districts on the languages of which he happened to be engaged. The importance, however, of the vast mass of linguistic material thus opened up by him, and of the results to which his investigations led, has not yet been fully realized, except so far, perhaps, as his numerous contributions to our knowledge of Eastern fables are concerned, for which branch of literature he evinced throughout his works a keen appreciation.

With a rare philological acumen, which with equal facility grasped the morphological and idiomatic parts of a language, Schiefner combined an indefatigable industry and a love of research which never flagged. He visited England three times for purposes of research,—in 1863, 1867, and 1878,—when he endeared himself to all who were brought in contact with him by his modesty and single-heartedness, his animated and spirited conversation, and his unswerving devotion to his various literary pursuits.

a dramatist. By and by he was persuaded to go again to Mannheim without leave, and for this offence, of which the duke of Württemberg was informed, he was condemned to two weeks' arrest. Shortly afterwards he was peremptorily forbidden to write books, or to hold communication with persons who did not reside in Württemberg. This tyrannical order filled him with so much indignation that he resolved at all costs to secure freedom, and on the 17th September 1782, accompanied by his friend Streicher, a young musician, he fled from Stuttgart.

Schiller had now before him a time of much distress and anxiety. In the course of a few weeks he finished *Fiesco*, a play which he had begun at Stuttgart, but Dalberg, the director of the Mannheim theatre, declined to put it on the stage, and the unfortunate poet knew not how he was to obtain the means of living. At the same time it was thought probable that a request for his extradition might be addressed to the elector of the Palatinate. In this perplexity Schiller wrote to Frau von Wolzogen, a friend at Stuttgart, asking to be allowed to take refuge in her house at Bauerbach, a village in the Thuringian Forest, within two hours' walk of Memmingen. This request was granted, and at Bauerbach Schiller remained for nearly seven months, working chiefly at the play which he ultimately called *Cubala und Liebe* and at *Don Carlos*.

In July 1783 Schiller returned to Mannheim, and this time he obtained from Dalberg a definite appointment as dramatic poet of the Mannheim theatre. *Fiesco*, which was soon represented, was received rather coldly, but for this disappointment Schiller was amply compensated by the admiration excited by *Cubala und Liebe*. These two plays express essentially the same mood as that which prevails in *Die Rauber*, but they indicate a striking advance in the mastery of dramatic methods. This is especially true of *Cubala und Liebe*, which still ranks as one of the most effective acting plays in German literature.

In addition to his dramas Schiller wrote a good many lyrical poems, both before and during his residence at Mannheim. Few of these pieces rise to the level of his early plays. For the most part they are excessively crude in sentiment and style, while in some his ideas are so vague as to be barely intelligible. Perhaps the best of them are the poems entitled *Die Freundschaft* and *Rousseau*, both of which have the merit of expressing thoughts and feelings that were within the range of the writer's personal experience.

Schiller's engagement with Dalberg was cancelled in August 1784, and, as he had now a heavy burden of debt, he thought for some time of resuming the practice of his profession, but in the end he decided to try whether he could not improve his circumstances by issuing a periodical, *Thalia*, to be written wholly by himself. This plan he accomplished, the first number being published in the spring of 1785. It contained the first act of *Don Carlos* and a paper on "The Theatre as a Moral Institution," which he had read on the occasion of his being admitted a member of the German Society, a literary body in Mannheim, of which the elector palatine was the patron.

Meanwhile, he had been corresponding with four admirers who had written from Leipzig to thank him for the pleasure they had derived from his writings. These friends were C. G. Körner, L. F. Huber, and Minna and Dora Stock. Weary of incessant struggle, Schiller proposed to visit them; and Körner, the leading member of the party, not only encouraged him in this design, but readily lent him money. Accordingly, in April 1785 Schiller left Mannheim, and for some months he lived at Gohlis, a village in the Rosenthal, near Leipzig. In the summer of the same year Körner and Minna Stock were

married, and settled in Dresden, taking with them Dora, Minna's sister. Schiller and Huber also went to Dresden, and Schiller remained there nearly two years. Almost every day he spent the afternoon and evening at Körner's house, and he derived permanent benefit from this intimate intercourse with the kindest and most thoughtful friends he had ever had. While in Dresden, he published in *Thalia* several prose writings, among others *Philosophische Briefe*, in which he set forth with enthusiasm some of his opinions about religion, and a part of the *Gästseher*, a romance, which, although written in a brilliant style, was so imperfectly planned that he was never able to finish it.

He also issued *Don Carlos*, which he completed early in 1787. A considerable interval having passed between the writing of the earlier and that of the later parts of this play, *Don Carlos* represents two different stages of intellectual and moral growth. It lacks, therefore, unity of design and sentiment. But it has high imaginative qualities, and the Marquis Posa, through whom Schiller gave utterance to his ideas regarding social and political progress, is one of the most original and fascinating of his creations. Posa is not less revolutionary than Karl Moor, the hero of *Die Rauber*, but, while the latter is a purely destructive force, the former represents all the best reconstructive energies of the 18th century.

In July 1787 Schiller went to Weimar, where he was cordially welcomed by Herder and Wieland. For several years after this time he devoted himself almost exclusively to the study of history, and in 1788 he published his *Geschichte des Abfalls der vereinigten Niederlande von der Spanischen Regierung*. This was followed by a number of minor historical essays (published in *Thalia*), and by his *Geschichte des dreissigjährigen Krieges*, which appeared in 1792. These writings secured for Schiller a high place among the historians of his own time. In every instance he derived his materials from original authorities, and they were presented with a freedom, boldness, and energy which made them attractive to all classes of readers. One result of the publication of his history of the revolt of the Netherlands was his appointment to a professorship at the university of Jena, where he delivered his introductory lecture in May 1789. He lived in Jena for about ten years, and during that time frequently met Fichte, Schelling, the two Schlegels, Wilhelm von Humboldt, and many other writers eminent in science, philosophy, and literature.

On the 22d of February 1790 Schiller married Charlotte von Lengefeld, whom he had met at Rudolstadt about two years before. She was of a tender and affectionate nature, bright and intelligent, and Schiller found in her love and sympathy a constant source of strength and happiness. They had four children, the eldest of whom was born in 1793.

About a year after his marriage he was attacked by a dangerous illness, and from this time he was always in delicate health, suffering frequently from paroxysms of almost intolerable pain. In the autumn of 1793 he went with his wife to Württemberg in the hope that his native air might do him good, and he did not return to Jena until the spring of the following year. He was enabled to obtain this period of rest through the kindness of the hereditary prince of Augustenburg and the minister Count von Schimmelmann, who had jointly begged to be allowed to place 3000 thalers at his disposal, to be paid in yearly instalments of 1000 thalers. Schiller heartily enjoyed his visit to his native state, where he had much pleasant intercourse with his father, mother, and sisters, and with some of his early friends. He did not again see his father and mother, the former of whom died in 1796, the latter in 1802.

The *Geschichte des dreissigjährigen Krieges* was the last

important historical work written by Schiller. He abandoned history in order to study philosophy, which, under the impulse communicated by Kant, was then exciting keen interest among the educated classes of Germany. Schiller's philosophical studies related chiefly to aesthetics, on which he wrote a series of essays, some of them being printed in *Neue Thalia* (issued from 1792 to 1794), others in the *Horen*, a periodical which he began in 1794 and continued until 1798. The most remarkable of these essays are a paper on "Die Anmuth und Würde," a series of letters addressed to the prince of Augustenburg on "Die ästhetische Erziehung des Menschen," and a treatise on "Die Naive und Sentimentalische Dichtung." In philosophical speculation Schiller derived inspiration mainly from Kant, but he worked his way to many independent judgments, and his theories have exercised considerable influence on those German writers who have dealt with the ultimate principles of art and literature. Goethe was of opinion that in "Die Naive und Sentimentalische Dichtung" Schiller had laid the foundation of modern criticism. In that powerful essay the vital distinction between classical and romantic methods was for the first time clearly brought out.

Schiller had been introduced to Goethe in 1788, but they did not begin to know one another well until 1794, when Goethe was attracted to Schiller by a conversation they had after a meeting of a scientific society at Jena. Afterwards their acquaintance quickly ripened into intimate friendship. To Schiller Goethe owed what he himself called "a second youth," and this debt was amply repaid, for by constant association with the greatest mind of the age Schiller was encouraged to do full justice to his genius. Moreover, his intellectual life was enriched by new ideas, and he was led by Goethe's indirect influence to balance his speculative judgments and idealistic conceptions by a keener and more accurate observation of the facts of ordinary life.

During the years which followed his departure from Mannheim Schiller had written *An die Freude*, *Die Götter Griechenlands*, *Die Künstler*, and other lyrical poems, all of which are of very much higher quality than the poems of his earlier period. But he had been so absorbed by labours of a different kind that he had had little time or inclination for his proper work as a poet. Now, stimulated by intercourse with Goethe, he began to long once more for the free exercise of his creative faculty; and from 1794 he allowed no year to pass without adding to the list of his lyrical writings. Among the lyrics produced in this the last and greatest period of his career the foremost place belongs to the *Lied von der Glocke*, but there is hardly less imaginative power in *Das Ideal und das Leben*, *Die Ideale*, *Der Spaziergang*, *Der Genius*, *Die Erwartung*, *Das Eleusische Fest*, and *Cassandra*. Few of Schiller's lyrics have the charm of simple and spontaneous feeling; but as poems giving expression to the results of philosophic contemplation the best of them are unsurpassed in modern literature. Schiller had a passionate faith in an eternal ideal world to which the human mind has access, and the contrast between ideals and what is called reality he presents in many different forms. In developing the poetic significance of this contrast his thoughts are always high and noble, and they are offered in a style which is almost uniformly grand and melodious.

In 1796 Schiller and Goethe together wrote for the *Musenalmach* (an annual volume of poems, issued for several years by Schiller) a series of epigrams called *Xenten*, each consisting of a distich. Most of them were directed against contemporary writers whom the poets disliked, and much animosity was excited by their sharply satirical tone. A higher interest attaches to

Fortetafeln, another series of epigrams, written at the same time as the *Xenten*. They are among the most suggestive of Schiller's writings, for, as he explains in the introductory epigram, they embody truths which he had found helpful in the experience of life. Soon after finishing these fine poems Schiller began, in rivalry with Goethe, to write his ballads, which surprised even his most ardent admirers by the boldness of their conceptions and by the graphic force of their diction. As a writer of ballads Goethe yielded the palm to Schiller, and this judgment has been confirmed by the majority of later critics.

Schiller never intended that *Don Carlos* should be his last drama, and from 1791 he worked occasionally at a play dealing with the fate of Wallenstein. He was unable, however, to satisfy himself as to the plan until 1798, when, after consulting with Goethe, he decided to divide it into three parts, *Wallensteins Lager*, *Die Piccolomini*, and *Wallensteins Tod*. *Wallensteins Lager* was acted for the first time at the Weimar theatre in October 1798, and *Die Piccolomini* in January 1799. In April 1799 all three pieces were represented, a night being given to each. The work as a whole produced a profound impression, and it is certainly Schiller's masterpiece in dramatic literature. He brings out with extraordinary vividness the ascendancy of Wallenstein over the wild troops whom he has gathered around him, and at the same time we are made to see how the mighty general's schemes must necessarily end in ruin, not merely because a plot against him is skilfully prepared by vigilant enemies, but because he himself is lulled into a sense of security by superstitious belief in his supposed destiny as revealed to him by the stars. Wallenstein is the most subtle and complex of Schiller's dramatic conceptions, and it taxes the powers of the greatest actors to present an adequate rendering of the motives which explain his strange and dark career. The love-story of Max Piccolomini and Thekla is in its own way not less impressive than the story of Wallenstein with which it is interwoven. Max and Thekla are purely ideal figures, and Schiller touches the deepest sources of tragic pity by his masterly picture of their hopeless passion and of their spiritual freedom and integrity.

Wallenstein was received with so much favour that Schiller resolved to devote himself in future mainly to the drama; and in order to be near a theatre—partly, too, that he might have more frequent opportunities of intercourse with Goethe—he transferred his residence, in December 1799, from Jena to Weimar, where he spent the rest of his life. He took with him to Weimar three acts of *Maria Stuart*, and early in the summer of 1800 he finished it at Eittersburg, a country house of the duke of Weimar. The technical qualities of *Maria Stuart* are of the highest order, but the subject does not seem to have interested Schiller very deeply, and it cannot be said either that the characters are finely conceived or that the closing scenes of Queen Mary's life are presented in a truly poetic spirit. In his next play, *Die Jungfrau von Orléans*, completed about a year afterwards, Schiller had a more congenial theme, and the vigour with which he handled it commanded the warm admiration of Goethe. The scenes in which the maid is misled by her passion for Lionel are slightly perplexing, as they do not appear to accord with the essential qualities of her character, but in the earlier and later parts of the play Schiller displays splendid dramatic art in revealing the lofty courage and enthusiasm with which she fulfils her mission. In *Die Braut von Messina*, which was acted for the first time at the Weimar theatre in March 1803, Schiller attempted to combine romantic and classical elements. The experiment is not perfectly successful, and even in its most striking

passages the play is remarkable rather for brilliant rhetoric than for pure poetry. His last original drama, *Wilhelm Tell*, the first representation of which took place in March 1804, is in some respects greater than any of those which preceded it, *Wallenstein* excepted. It has some obvious faults of construction, but these defects do not seriously mar the impression produced by its glowing picture of a romantic and truly popular struggle for freedom.

Besides his complete original plays, Schiller left some dramatic sketches and fragments, the most important of which, *Dionisus*, has been finished in Schiller's manner by several later writers. He also produced German versions of *Macbeth*, of Gozzi's *Twandot*, of two comedies by Picard, and of *Phidre*. His renderings of Picard's comedies are entitled *Der Parasit* and *Der Neffe als Onkel*.

In his last years Schiller received many tokens of growing fame. In 1802 he was raised to noble rank, and in 1804 he was informed that if he pleased he might be invited to settle in Berlin on advantageous terms. He went with his family to the Prussian capital, but the only result of the negotiations into which he entered was that the duke of Weimar, alarmed at the prospect of losing him, doubled his salary of 400 thalers. His health was at this time completely undermined, and from the summer of 1804 work was often rendered impossible by serious illness. On the evening of the 29th April 1805 he returned from the Weimar theatre in a state of high fever, and from this attack he was unable to rally. He died on the 9th May 1805, in his forty-sixth year.

Schiller was tall, slight, and pale, with reddish hair, and eyes of an uncertain colour, between light-brown and blue. At the military academy he acquired a manner somewhat formal, like that of a soldier, but in carrying on conversation that interested him he became eager and animated. He had little appreciation of humour, and even in the treatment of subjects which he made his own he was apt to recur too frequently to the same ideas and the same types of character. But when he is at his best he is excelled among the poets and dramatists of Germany only by Goethe in the power with which he expresses sublime thoughts and depicts the working of ideal passions. As a man he was not less great than as a writer. He started in life with high aims, and no obstacle was ever formidable enough to turn him from paths by which he chose to advance to his goal. Terrible as his physical sufferings often were, he maintained to the last a genial and buoyant temper, and those who knew him intimately had a constantly increasing admiration for his patience, tenderness, and charity. With all that was deepest and most humane in the thought of the 18th century he had ardent sympathy, and to him were due some of the most potent of the influences which, at a time of disaster and humiliation, helped to kindle in the hearts of the German people a longing for a free and worthy national life.

There have been many editions of Schiller's collected works. The first was issued in twelve volumes at Stuttgart and Tübingen in 1812-15, the editor being his friend C. G. Körner. There are also a good many volumes of Schiller's correspondence, the most interesting being his correspondence with Goethe. Of the biographies of Schiller, Carlyle's—published in 1825—was one of the earliest. See also *Schillers Leben*, by Frau von Wolzogen, Schiller's sister-in-law, *Schillers Leben*, by Hoffmeister (extended by Viehoff), *Schillers Leben*, by Boas, *Schillers Leben und Werke*, by Palleske, *Schillers Leben*, by H. Duntzer, and *Schiller*, by J. Sime (in "Foreign Classics for English Readers") (J. S.).

SCHINKEL, KARL FRIEDRICH (1781-1841), architect and painter, and professor in the academy of fine arts at Berlin from 1820, was born at Neuruppin, in Brandenburg, on March 13, 1781, and died at Berlin, on October 9, 1841. He is esteemed one of the most original of modern German architects. His principal buildings are in BERLIN (*q.v.*) and its neighbourhood. They include the Bauakademie,

which contains a museum of his designs. His *Sammlung architektonischer Entwürfe* (1820-1837, 3d ed. 1857-58) and *Werke der höheren Baukunst* (1845-6; new ed. 1874) exemplify his style.

SCHIRMER, FRIEDRICH WILHELM (1802-1866), landscape artist, was born in 1802 in Berlin. As a youth he painted flowers in the royal porcelain factory; afterwards he became a pupil of F. W. Schadow in the Berlin Academy, but his art owed most to Italy. His first journey across the Alps was taken in 1827, his sojourn extended over three years; he became a disciple of his countryman Joseph Koch, who built historic landscape on the Poussins, and is said to have caught inspiration from Turner. In 1831 Schirmer established himself in Berlin in a studio with scholars, in 1839 he was appointed professor of landscape in the academy; in 1845 he again visited Italy, but duties soon brought him back to Berlin. Illness compelled him in 1865 to seek a southern clime, he grew worse in Rome, and died on his way home in 1866.

Schirmer's place in the history of art is distinctive. His sketches in Italy were more than transcripts of the spots, he studied nature with the purpose of composing historic and poetic landscapes. On the completion of the Berlin Museum of Antiquities came his opportunity: upon the walls he painted classic sites and temples, and elucidated the collections by the landscape scenery with which they were historically associated. His supreme aim at all times was to make his art the poetic interpretation of nature. His pictures appeal to the mind by the ideas they embody, by beauty of form, harmony of line, significance of light and colour. In this constitutional landscape German artists discover "motifs," "inner meaning," "the subjective," "the ideal." And Schirmer thus formed a school. Nevertheless at times he painted poor pictures, partly because he deemed technique secondary to conception.

SCHIRMER, JOHANN WILHELM (1807-1863), landscape painter, was born in 1807, at Jülich in Rhenish Prussia. This artist, only a namesake of the preceding, had similar aim and career. He first was a student, and subsequently became a professor in the academy of Düsseldorf. In 1854 he was made director of the art school at Karlsruhe, where in 1863 he died. He travelled and sketched in Italy, and aimed at historic landscape after the manner of the Poussins. His Biblical landscapes with figures are held in good esteem.

SCHIZOMYCETES, a term proposed by Nageli in 1857 to include all those minute organisms known as Bacteria, Microphytes, Microbes, &c., and allied forms. These terms have been used at various times by different authors with widely different meanings in detail, but it is now agreed that the Schizomycetes are minute vegetable organisms devoid of chlorophyll and multiplying by repeated bipartitions. They consist of single cells, which may be spherical, oblong, or cylindrical in shape, or of filamentous or other aggregates of such cells. True spores occur in several, but no trace whatever of sexual organs exists. From their mode of growth, division, and spore-formation (in part), as well as their habit of forming deliquescent, swollen cell-walls, and other peculiarities, there can be no doubt of the close alliance between the Schizomycetes and certain lower *Algae*, whence both groups have been conjoined under the name *Schizophyta*. No one character except the want of chlorophyll—which of course entails physiological differences—separates the Schizomycetes from other *Schizophyta*; morphologically and phylogenetically the two groups are united. From this point of view we relegate all the so-called bacteria which contain chlorophyll (*e.g.*, Engelmann's *Bacterium chlorinum*, Van Tieghem's *B. viride* and *Bacillus vires*, Cohn's *Micrococcus chlorinus*, &c.) to the *Algae*.

Schizomycetes, then, are saprophytic or parasitic *Schizophyta* devoid of chlorophyll, though they may secrete other colouring matters. In size their cells are commonly about 0.001 mm. (called 1 micro-millimetre = 1μ) in diameter, or from two to five times that length, but smaller ones and

a few larger are known. The various shapes assumed by the cells are shown in fig 1, the filamentous and other aggregates will be described below

FIG 1.—Typical forms of Schizomycetes (After Zopf). a, *Micrococcus*; b, *Micrococcus* or "Stoma"; c, *Dactylotherium*; d, *Bacillus*; e, *Clostridium*; f, *Mona clemens*; g, *Leptothrix*; h, i, *Vibrio*; j, *Spirillum*; k, l, *Spirillum* (a form of *Beggiatoa alba*); m, n, *Spirillum* (Warming); o, *Spirillum*; p, *Cladostrix*. The granules in b, f, and i are patches of sulphur.

General account

Schizomycetes are ubiquitous as saprophytes in still ponds and ditches, in running streams and rivers, and in the sea, and especially in drains, bogs, refuse heaps, and in the soil, and wherever organic infusions are allowed to stand for a short time. Any liquid (blood, urine, milk, beer, &c.) containing organic matter, or any solid food-stuff (meat, preserves, vegetables, &c.) allowed to stand exposed to the air soon swarms with bacteria, if moisture is present and the temperature not abnormal. Though they occur all the world over in the air and on the surface of exposed bodies, it is not to be supposed that they are by any means equally distributed, and it is questionable whether the bacteria suspended in the air ever exist in such enormous quantities as was once believed. The evidence to hand shows that on heights and in open country, especially in the north, there may be few or even no Schizomycetes detected in the air, and even in towns their distribution varies greatly; sometimes they appear to exist in minute clouds, as it were, with interspaces devoid of any, but in laboratories and closed spaces where their cultivation has been promoted the air may be considerably laden with them. Of course the distribution of bodies so light and small is easily influenced by movements, rain, wind, changes of temperature, &c. As parasites, certain Schizomycetes inhabit and prey upon the organs of men and animals in varying degrees, and the conditions for their growth and distribution are then very complex. Plants appear to be less subject to their attacks,—possibly, as has been suggested, because the acid fluids of the higher vegetable organisms are less suited for the development of Schizomycetes; nevertheless some are known to be parasitic on plants. Schizomycetes exist in every part of the alimentary canal of animals, except, perhaps, where acid secretions prevail, these are by no means necessarily harmful, though, by destroying the teeth for instance,

certain forms may incidentally be the forerunners of damage which they do not directly cause.¹

Little was known about these extremely minute organisms before 1860. Leeuwenhoek figured *Bacteria* as far back as the 17th century, and O. F. Müller knew several important forms in 1773, while Ehrenberg in 1830 had advanced to the commencement of a scientific separation and grouping of them, and in 1838 had proposed at least sixteen species, distributing them into four genera. Our modern more accurate though still fragmentary knowledge of the forms of Schizomycetes, however, dates from Cohn's brilliant researches, the chief results of which were published at various periods between 1853 and 1872. Cohn's classification of the *Bacteria*, published in 1872, and extended in 1875, has in fact dominated the study of these organisms almost ever since. He proceeded in the main on the assumption that the forms of *Bacteria* as met with and described by him are practically constant, at any rate within limits which are not wide, observing that a minute spherical *Micrococcus* or a rod-like *Bacillus* regularly produced similar micrococci and bacilli respectively, he based his classification on what may be considered the constancy of forms which he called species and genera. As to the constancy of form, however, Cohn maintained certain reservations which have been ignored by his followers. The fact that Schizomycetes produce spores appears to have been discovered by Cohn in 1837, though it was expressed dubiously in 1872, these spores had no doubt been observed previously. In 1876, however, Cohn had seen the spores germinate, and Koch, Brefeld, Pratzmowski, Van Tieghem, De Bary, and others confirmed the discovery in various species.

The supposed constancy of forms in Cohn's species and genera received a violent shock when Lankester in 1873 pointed out that his *Dactylotherium rubescens* (since named *Beggiatoa roseo-persicana*, Zopf) passes through conditions which would have been described by most observers influenced by the current doctrine as so many separate "species" or even "genera,"—that in fact forms known as *Dactylotherium*, *Micrococcus*, *Bacillus*, *Leptothrix*, &c., occur as phases in one life-history. Lister put forth similar ideas about the same time; and Billroth came forward in 1874 with the startling view that the various "form species" and "form-genera" are only different states of one and the same organism. From that time to the present the discussion as to the limits of "species" among the Schizomycetes has been maintained, much extravagance has resulted, as well as valuable additions to our knowledge of the forms. Klebs (1875) and Nageli (1877) upheld similar views to those suggested by Lankester; and the researches of Cienkowski, Zopf, Kurth, and De Bary have rendered it clear that forms employed by Cohn to define genera and species (it should be borne in mind that Cohn recognized their provisional nature) occur as phases in one and the same life-history. Zopf showed (1882) that minute spherical "cocci," short rodlets ("bacteria"), longer rodlets ("bacilli"), and filamentous ("leptothrix") forms as well as curved and spiral threads ("vibrio," "spirillum"), &c., occur as vegetative stages in one and the same Schizomycete (cf. fig. 16). In the meantime, while various observers were building up our knowledge of the morphology of the Schizomycetes, others were laying the foundations of what is known of the relations of these organisms to fermenta-

Hft. 1, 1879; Pasteur, *Jour. de Chim. et de Phys.*, ser. in, 1862; Miquel, *Comptes Rendus*, 1878, and *Annuaire de l'observatoire de Montsouris*, 1877 &c.

tion and disease,—that ancient Will-o'-the-wisp "spontaneous generation" being revived by the way. When Pasteur in 1857 showed that the lactic fermentation depends on the presence of an organism, it was already known from the researches of Schwann (1837) and Helmholtz (1843) that fermentation and putrefaction are intimately connected with the presence of organisms derived from the air, and that the preservation of putrescible substances depends on this principle. In 1862 Pasteur placed it beyond reasonable doubt that the ammoniacal fermentation of urea is due to the action of a minute Schizomycete, in 1864 this was confirmed by Van Tieghem, and in 1874 by Cohn, who named the organism *Micrococcus uree*. Pasteur and Cohn also pointed out that putrefaction is but a special case of fermentation, and before 1872 the doctrines of Pasteur were established with respect to Schizomycetes. Meanwhile two branches of inquiry had arisen, so to speak, from the above. In the first place, the ancient question of "spontaneous generation" received fresh impetus from the difficulty of keeping such minute organisms as bacteria from reaching and developing in organic infusions, and, secondly, the long-suspected analogies between the phenomena of fermentation and those of certain diseases again made themselves felt, as both became better understood. Needham in 1745 had declared that heated infusions of organic matter were not deprived of living beings; Spallanzani (1777) had replied that more careful heating and other precautions prevent the appearance of organisms in the fluids. Various experiments by Schwann, Helmholtz, Schultz, Schroeder, Dusch, and others led to the refutation, step by step, of the belief that the more minute organisms, and particularly bacteria, arose *de novo* in the special cases quoted. Nevertheless, instances were adduced where the most careful heating of yolk of egg, milk, hay-infusions, &c. had failed,—the boiled infusions, &c., turning putrid and swarming with Schizomycetes after a few hours.

In 1862 Pasteur repeated and extended such experiments, and paved the way for a complete explanation of the anomalies; Cohn in 1872 published confirmatory results; and it became clear that no putrefaction can take place without Schizomycetes. In the hands of Brefeld, Burdon-Sanderson, De Bary, Tyndall, Roberts, Lister, and others, the various links in the chain of evidence grew stronger and stronger, and every case adduced as one of "spontaneous generation" fell to the ground when examined. No case of so-called "spontaneous generation" has withstood rigid investigation; but the discussion contributed to more exact ideas as to the ubiquity, minuteness, and high powers of resistance to physical agents of the spores of Schizomycetes, and led to more exact ideas of antiseptic treatments. Methods were also improved, and the application of some of them to surgery at the hands of Lister, Koch, and others has yielded results of the highest importance.

Long before any clear ideas as to the relations of Schizomycetes to fermentation and disease were possible, various thinkers at different times had suggested that resemblances exist between the phenomena of certain diseases and those of fermentation, and the idea that a virus or contagium might be something of the nature of a minute organism capable of spreading and reproducing itself had been entertained. Such vague notions began to take more definite shape as the ferment theory of Cagniard-Latour (1828), Schwann (1837), and Pasteur made way, especially in the hands of the last-named savant. From about 1870 onwards the "germ theory of disease" has passed into acceptance. Rayer in 1850 and Davaine had observed the bacilli in the blood of animals dead of anthrax (splenic fever), and Pollender discovered

them anew in 1855. In 1863, imbued with ideas derived from Pasteur's researches on fermentation, Davaine re-investigated the matter, and put forth the opinion that the anthrax bacilli caused the splenic fever, this was proved to result from inoculation. Koch in 1876 published his observations on Davaine's bacilli, placed beyond doubt their causal relation to splenic fever, discovered the spores and the saprophytic phase in the life-history of the organism, and cleared up important points in the whole question (figs 10 and 11). In 1870 Pasteur had proved that a disease of silkworms was due to a ferment-organism of the nature of a Schizomycete, and in 1871 Oertel showed that a *Micrococcus* already known to exist in diphtheria is intimately concerned in producing that disease. In 1872, therefore, Cohn was already justified in grouping together a number of "pathogenous" Schizomycetes. Thus arose the foundations of the modern "germ theory of disease"; and, in the midst of the wildest conjectures and the worst of logic, a nucleus of facts was won, which has since grown, and is growing daily. Sepsæmia, tuberculosis, glanders, fowl-cholera, relapsing fever, and a few other diseases are now brought definitely within the range of biology, and several other contagious and infectious diseases are known to be also due to Schizomycetes.

Other questions of the highest importance have arisen from the foregoing. A few years ago Pasteur showed that *Bacillus anthracis* cultivated in chicken broth, with plenty of oxygen, and at a temperature of 42–43° C lost its virulence after a few "generations," and ceased to kill even the mouse, Toussaint and Chaveau confirmed, and others have extended the observations. More remarkable still, animals inoculated with such "attenuated" bacilli proved to be curiously resistant to the deadly effects of subsequent inoculations of the non-attenuated form. In other words, animals vaccinated with the cultivated bacillus showed immunity from disease when reinoculated with the deadly wild form. The questions as to the causes and nature of the changes in the bacillus and in the host, as to the extent of immunity enjoyed by the latter, &c., are now burning.—Metschnikoff's recent observations (1884), showing that the white corpuscles eliminate the bacilli from the blood, being one of the most startling contributions to the answers.

Another burning question has already been in part touched upon. Experiments have shown that Schizomycetes are pleomorphic, they are also very sensitive, so to speak, to the influences of the environment. The investigations of Cohn, Pasteur, Koch, Nagel, Kurth, De Bary, and others leave no doubt that many Schizomycetes are sensibly affected by the media in which they are cultivated—not only are the forms modified, but also the physiological activity varies in degree, and even in kind. These and similar facts seem to be largely responsible for recent ideas as to the possibility of being able to cultivate or "educate" certain Schizomycetes. One case only need be referred to *Bacillus anthracis* and *B. subtilis* are only distinguishable with great difficulty morphologically (cf figs. 10–12), the former is parasitic in its vegetative stages, the latter is always a saprophyte. Now *B. anthracis*, as said, can become harmless by cultivation, and so it has been thought that the two forms were convertible. Buchner even went so far as to declare that he had transformed *B. anthracis* into *B. subtilis*, &c., that the differences which botanists detect are only due to the influence of the environment at the time. These assertions cannot be regarded as proved, but the question whether harmless forms can become educated, as it were, to a parasitic mode of life within periods which we can control is of course of the highest importance. Such are a few of the questions now under discussion, together with others as to the mode of action of patho-

genic Schizomycetes, as to the nature of immunity, and as to the limitation of "species" among such simple forms¹.

MORPHOLOGY—*Size, Forms, Structure, &c.*—The Schizomycetes consist of single cells, or of filamentous or other groups of cells, according as the divisions are completed at once or not. While some unicellular forms are less than 1μ (0.001 mm) in diameter, others have cells measuring 4μ or 5μ , or even 7μ or 8μ in thickness, while the length may vary from that of the diameter to many times that measurement. In the filamentous forms the individual cells are often difficult to observe until reagents are applied (e.g., fig. 14), and the length of the rows of cylindrical cells may be many hundred times greater than the breadth. Similarly, the diameters of flat or spheroidal colonies may vary from a few times to many hundred times that of the individual cells, the divisions of which have produced the colony. The shape of the individual cell (fig. 1) varies from that of a minute sphere to that of a straight, curved, or twisted filament or cylinder, which is not necessarily of the same diameter throughout, and may have flattened, rounded, or even pointed ends. The rule is that the cells divide in one direction only—i.e., transverse to the long axis—and therefore produce aggregates of long cylindrical shape, but in rarer cases iso-diametric cells divide in two or three directions, producing flat, or spheroidal, or irregular colonies, the size of which is practically unlimited. As to the structure of the cell, little more can be said than that it consists of a mass of homogeneous or very slightly granular protoplasm, with a pearl-like lustre, and without vacuoles, this is enveloped by a membranous envelope, which is so delicate as to be scarcely perceptible. In the actively vegetating or mobile conditions this cell wall appears very thin and sharp, and is extremely flexible and elastic, but at other times it is swollen and diffuent, furnishing the intercellular gelatinous matrix of the zoogloea condition (fig. 3). It is doubtful whether the thin envelope closely applied to the protoplasm is not always simply the innermost layer of a very diffuent covering, which is continuously thickening and throwing off its outermost swollen and disorganized lamellae. The facts to hand seem to show that, while in some cases this envelope consists mainly of cellulose, in others (zoogloea of *Bacteria*, e.g.) it contains relatively large proportions of nitrogenous compounds. In some cases the cell-walls form a lamellated sheath. No calcularization occurs, nor are deposits of lime or silex known in the cell walls. Colouring pigments, however (red, yellow, and even green and blue), are sometimes met with, and a rusty or brown tinge is in some cases produced by the precipitation of iron oxides in the walls. In the typical Schizomycetes the protoplasmic contents (which are said to consist largely of a peculiar substance named mycoprotein) are colourless, or more rarely tinged with colouring matters—bright red, yellow, &c.—which cannot be mistaken for chlorophyll. The few forms described as containing a green pigment, allied to or identical with chlorophyll, will not be considered here, but relegated to the *Algae*. The occurrence of starch or a granule-like substance in some *Bacteria* is undoubtedly, it yields a deep blue colour with iodine solutions, is diffused in bands or patches, and arises in cases where

the Schizomycete is nourished by a matrix which does not contain starch. Trecul noticed this formation of amyloid substance in *Clostridium*, Van Tieghem in a *Spirillum*, and several other cases are known. Ward detected starch in a *Bacillus* found in decaying coffee seeds, and in other media devoid of starch. In the filamentous Schizomycetes (*Beggiatoa*, e.g.) are found extremely minute dark granules, Cramer and Cohn have shown that these consist of sulphur in fine crystals (fig. 14). Only or fatty substances and minute granules of undetermined nature occur in the protoplasm, but no nucleus has as yet been discovered in any Schizomycete.

Vegetative States.—While many forms are fixed to a Vegetative substratum, others are free, and in certain conditions single cells or groups may be motile. In some cases the movements are mere oscillations, in others there are rapid movements of translation, sometimes ascribed to the action of flagella or cilia, these movements are of course not to be confounded with the dancing "Brownian motion" observed in the case of all such minute bodies suspended in fluids. Cilia have now been described in some of the smallest *Bacteria* by several good observers (Dallinger and Drysdale,² Cohn, Koch, Zopf), though, on account of their extreme fineness, and the difficulty of fixing them, much discussion has taken place as to their nature, functions, origin, numbers, and even existence, that they occur is proved by the photographs, but whether they are not sometimes mere filaments drawn out from the cell-walls is very doubtful (figs. 2 and 12). While some Schizomycetes appear to have no active stage, and many are only motile under certain conditions when swarming, others

FIG. 2.—Types of motile and dilated forms of Schizomycetes (After Zopf). 1, Micrococcus with one cilium; 2, the same dividing; 3, group of swarming micrococci of *Beggiatoa* *oxydum*; 4, *Bacterium-like* motile form of the same; 5, 6, 7, 8, 9, and 10, other forms of the same (6 is dividing); 11, bacillus-like motile form (Koch); 12, motile chain of hay bacilli (Streptococcus); 13, *epithelium* form with one cilium at each end; 14, motile epithelium-like form with two cilia at each end; 15, *epithelium* form (Warming). The granules in 3, 4, 7, 8, 9, 12, and 13 are particles of sulphur.

as a rule present certain definite forms, which are at any rate so constant under constant conditions that they can be figured and described with such accuracy and certainty that good observers have regarded them as fixed species, or at least as "form-species" or "form-genera." We now know, however, that many Schizomycetes pass through several such phases, and we may therefore regard them in these cases as "vegetative forms" which pass into one another too gradually to admit of their being employed as sharply distinctive of genera.

As the chief of these forms may be mentioned the following (see fig. 1).—

¹ In addition to the foregoing, compare Nageli, *Untersuchungen über niedere Pilze*, 1882, Buchner, *ibid.*, and in Virch. Arch., xxi., 1883, Nageli, *Theorie der Gährung*, 1879, Chaveau in *Comptes Rendus*, 1879-1884, Davane, *ibid.*, 1883-84 and 1873; B. Ray Lankester, *Quart. Jour. of Micros. Sc.*, 1873 and 1876 (also valuable papers in Q. J. M. S. from 1870 to 1884); Pasteur, numerous papers in *Comptes Rendus*—especially 1862 and 1877—and in *Ann. de Chim. et Phys.*, 1855, 1869, &c.; Koch in *Cohn's Beitr.*, ii. Hft. 2, 1876; Kurlb., *Beit. Zeilung*, 1883, Schützenberger, *Fermentation*, 1876, Metschnikoff, *Virch. Arch.*, 1884, *Nature*, various papers from 1871 to 1878.

² Dallinger and Drysdale, *Monthly Micros. Jour.*, 1875.

Cylindrical or sphaecoid cells which, according to their relative (not very well defined) sizes are spoken of as *Micrococci*, *Macrococci*, and perhaps *Stavos* forms.

Pilis or *whistles* slightly or more considerably elongated cells which are cylindrical, bisect shaped, or somewhat fusiform. The cylindrical forms are short, i. e., only twice or four times as long as broad (*Dactyliothrix*), or longer (*Brachytrichia*), the last-shaped ones are *Stavos* in the early stages of division. *Cladotrichia*, etc., are spindle-shaped.

Filaments (*Lophotrichia* forms) really consist of elongated cylindrical cells which remain united end to end after division, and they may break up later into elements such as those described above. Such filaments are not always of the same diameter throughout, and their segmentation varies considerably. They may be free, or attached at one (the "basal") end. A distinction is made between *simple* filaments (e. g., *Lophotrichia*) and such as exhibit a false branching (e. g., *Cladotrichia*).

Cretic and *spiral* forms. Any of the elongated forms described above may be curved, or sinuous, or twisted into a coiled spiral instead of straight. If the sinuosity is slight we have the *Fibra* form, if pronounced, and the spiral tendency well marked, the forms are known as *Spirillum*, *Spirachne*, etc. These and similar terms have been applied partly to individual cells, but more often to filaments consisting of several cells, and much confusion has arisen from the difficulty of defining the terms themselves. Various observers have, moreover, described particular cases where the cells or cell-filaments exhibit irregularities of form, such as "irregular forms," "torula forms," etc., appear to be fully constant in some cases.

In addition to the above, however, certain Schizomycetes present aggregates in the form of plates, or solid or hollow and irregular

FIG. 3.—Types of Zooglia. (After Zoef.) A, mixed zooglia found as a pellicle on the surface of vegetable infusions, etc. B, egg-shaped mass of zooglia of *Euglenoides rostratus* (*Bacterium rubescens* of Lankester), the gelatinous swollen walls of the large crowded cocci are fused into a common reticulate envelope. C, reticulate zooglia of the same ($\times 520$). D, E, H, colonies of *Myxococcus* enveloped in different matrices ($\times 540$). F, branched fruticose zooglia of *Cladotrichia* (slightly magnified). G, zooglia of *Bacterium morphogenes*, Zoof, containing cocci arranged in tablets.

branched colonies. This may be due to the successive divisions occurring in two or three planes instead of only across the long axis (*Sarcina*), or to displacements of the cells after division (as in the zooglia conditions, etc., see fig. 3).

Growth and Division.—Whatever the shape and size Reproductive of the individual cell, cell-filament, or cell-colony, the two immediate visible results of active nutrition

FIG. 4.—A, branch of a zooglia of *Cladotrichia dichotoma* (cf fig. 3, F, $\times 540$ (After Zoef)). It contains short and longer bacillar forms (a and b), *Lophotrichia* forms (c), some of which are curved like *Vibrio* (d) and *Spirillum*. B, the same, but the iodide breaking up into cocci (After Zoef).

shorter or longer time. This process is then repeated, and so on. In the first case the separated cells assume the characters of the parent-cell whose division gave rise to them, in the second case they form filaments, or, if the further elongation and divisions of the cells proceed in different directions, plates or sphaecoid or other-shaped colonies. It not unfrequently happens, however, that groups of cells break away from their former connexion as longer or shorter straight or curved filaments, or as solid masses. In some filamentous forms this "fragmentation" into multicellular pieces of equal length or nearly so is a normal phenomenon, each partial filament repeating the growth, division, and fragmentation as before (cf figs 15 and 16). Finally, such filaments may break up into their individual cells, forming "bacilli," "bacteria," or "cocci" as the case may be. By these means hundreds of thousands of cells may be produced in a few hours,¹ and, according to the

FIG. 5.—Types of Spore-formation in Schizomycetes (After Zoef). A, various stages in the development of the endogenous spores in a *Cladotrichium* (*Bacillus*)—the small letters indicate the older. B, endogenous spores of the hay bacillus. C, a chain of cocci of *Leuconostoc mesenteroides*, with two "resting spores," etc., arthrospores (After Van Nieuwen). D, a motile iodide with one column and with a spore formed inside. E, spore-formation in *Vibrio*-like (a) and *Spirillum*-like (b, c, d) Schizomycetes. F, long rod-like form containing a spore (these are the so-called "Zoof-bacteria" of German authors). G, *Vibrio* form with spore (After Praxinos). H, *Cladotrichium*—one cell contains two spores (Praxinos). I, *Spirillum* containing many spores (a), which are liberated at b by the breaking up of the parent cells. K, germination of the spore of the hay bacillus (B. subtilis)—the axis of growth of the germinal iodide is at right angles to the long axis of the spore. L, germination of spore of *Cladotrichium butyricum*—the axis of growth coincides with the long axis of the spore.

¹ Brefeld has observed that a bacterium may divide once every half hour, and its progeny repeat the process in the same time. One bacterium might thus produce in twenty-four hours a number of segments amounting to many millions of millions.

species and the conditions (the medium, temperature, etc.). enormous collections of isolated cells may cloud the fluid in which they are cultivated, or form deposits below or films on its surface, valuable characters sometimes obtained from these appearances. When these dense "swarms" of vegetative cells become fixed in a matrix of their own swollen contiguous cell-walls, they pass over into a sort of resting state as a so-called zoogloea (fig. 3).

One of the most remarkable phenomena in the life-history of the Schizomycetes is the formation of this zoogloea stage, which corresponds to the "palmella" con-

FIG. 6.—Characteristic groups of *Micrococcus*. (After Cohn.) A, *Micrococcus proteus*; B, *M. vacuolatus*; C, zoogloea stage of a *Micrococcus*, forming a close meshwork on an infusion—*Yeast in glucose* (very highly magnified).

dition of the lower *Algae*. This occurs as a membrane on the surface of the medium, or as irregular clumps or branched masses (sometimes several inches across) submerged in it, and consists of more or less gelatinous matrix enclosing innumerable "cocci," "bacteria," or other elements of the Schizomycete concerned. Formerly regarded as a distinct genus—the natural fate of all the various forms—the zoogloea is now known to be a sort of resting condition of the Schizomycetes, the various elements being glued together, as it were, by their enormously swollen and diffuent cell-walls becoming con-

FIG. 8.—*Bacillus subtilis*. (After Kurth.) A, coils of the filamentous (*leptothrix*) stage still actively growing; B, the same coils observed a few hours later, the filaments having become cut up into segments by septa, the segments separating as rodlets (*bacteria*); C, the same coils a few hours later still, the rodlets broken up into yet shorter segments or cocci ($\times 740$).

tiguous. The zoogloea is formed by active division of single or of several mother-cells, and the progeny appear to go on secreting the cell-wall substance, which then

absorbs many times its volume of water, and remains as a consistent matrix, in which the cells come to rest. The matrix—the swollen cell-walls—in some cases consists mainly of cellulose, in others chiefly of "mycoprotein," the substance said to be met with in the protoplasm, the matrix in some cases is horny and resistant, in others more like a thick solution of gum. It is intelligible from the mode of formation that foreign bodies may become entangled in the gelatinous matrix, and compound zoogloea may arise by the apposition

FIG. 9.—*Bacillus megaterium*. (After De Bary.)

of several distinct forms, a common event in macerating troughs (fig. 3, A). Characteristic forms may be assumed by the young zoogloea of different species,—spherical, ovoid, reticular, filamentous, fruticose, lamellar, &c,—but these vary considerably as the mass increases or comes in contact with others. Older zoogloea may precipitate oxide of iron in the matrix, if that metal exists in small quantities in the medium. Under favourable conditions the elements in the zoogloea again become active, and move out of the matrix, distribute themselves in the surrounding medium, to grow and multiply as before (fig. 4). If the zoogloea is formed on a solid substratum it may become firm and horny, immersion in water softens it as described above.

FIG. 10.—*Bacillus anthracis*. (After Koch.) A, *Bacilli* mingled with blood-corpuscles from the blood of a Guinea pig, some of the bacilli dividing; B, the rodlets after three hours' culture in a drop of aqueous humor. They grow out into long *leptothrix*-like filaments, which become septate later, and spores are developed in the segments ($\times 660$).

Spores.—Spores or resting-cells are now known in many Schizomycetes (fig. 5). They may be formed in two ways. In *Leuconostoc*, *Bacterium subtilis*, *Crenothrix*, *Beggiatoa*, and *Cladothrix* the spore is simply one of the smallest segments ("cocci") into which the filament at length breaks up. De Bary terms such forms "arthrospores" (cf. figs. 8, 13, 14, and 16). In others the formation of the spore is "endospore" (De Bary). It begins with the appearance of a minute granule in the protoplasm of a vegetative cell, this granule enlarges, and in a few

hours has taken to itself all the protoplasm, secreted a dense envelope, and is a ripe ovoid spore, smaller than the mother-cell, and lying loosely in it (*cf.* figs. 9, 11, and 12) In the case of the simplest and most minute Schizomycetes (*Micrococcus*, &c.) no definite spores have been discovered, any one of the vegetative micrococci may commence a new series of cells by growth and division. We may call these forms "asporous," at any rate provisionally.

The spore may be formed in short or long segments, the cell-wall of which may undergo change of form to accommodate itself to the contents. As a rule only one spore is formed in a cell, and the process usually takes place in a bacillar segment. In some cases the spore-forming protoplasm gives a blue reaction with iodine solutions. The spores may be developed in cells which are actively swarming, the movements not being interfered with by the process (fig. 5, D). The so-called "Kopfenbakterien" of older writers are simply bacteroid segments with a spore at one end, the mother cell-wall having adapted itself to the outline of the spore (fig. 5, F). The ripe spores of Schizomycetes are spherical, ovoid, or long-ovoid in shape, and extremely minute (*e.g.*, those of *Bacillus subtilis* measure 0.0012 mm. long by 0.0006 mm. broad according to Zopf), highly refractive and colourless (or very dark, probably owing to the high index of refraction and minute size). The membrane may be relatively thick, and even exhibit shells or strata.

The germination of the spores has now been observed in several forms with care. The spores are capable of germination at once, or they may be kept for months and even years, and are very resistant against desiccation, heat and cold, &c. In a suitable medium and at a proper temperature the germination is completed in a few hours. The spore swells and elongates, and the contents grow forth to a cell like that which produced it, in some cases clearly breaking through the membrane, the remains of which may be

FIG. 11.—*A*, *Bacillus anthracis* (After De Bary) Two of the long filaments (*B*, fig. 10), in which spores are being developed. The specimen was cultivated in broth, and the spores are fairly a little too small—they should be of the same diameter transversely as the segments ($\times 600$) *B*, *Bacillus subtilis* (After De Bary) 1, fragments of filaments with ripe spores, 2-5, successive stages in the germination of the spores, the remains of the spore attached to the germinal rodlets ($\times 600$)

seen attached to the young germinal rodlet (figs. 5, 9, and 11), in other cases the surrounding membrane of the spore swells and dissolves. The germinal cell then grows forth into the forms typical for the particular Schizomycete concerned.¹

¹ Cohn, *Beiträge zur Biologie, passim*, Zopf, *Die Spaltspizien*, 3d ed., 1885, De Bary, *Morph. und Biol. der Pilze*, &c., 1884, and

Pleomorphism.—As already stated, some Schizomycetes Pleo- have been shown to present as vegetative forms, or phases morph- in one and the same life-history, "cocci," "bacteria,"¹⁸⁸⁵ "leptothrix-filaments," and even spiral and curved forms known as "spirillum," "vibrio," &c. On the other hand, several Schizomycetes which have been long and diligently investigated by the best observers show no such pleomorphism. As examples of the latter we may select *Bacillus megaterium* (fig. 9) and numerous *Micrococcus* which produce similar cells generation after generation. A remarkable example of a pleomorphic form is *Cladothrix dichotoma* (fig. 16). According to Zopf this species passes successively through the stages known as "coccus," "bacteroid," "bacillar," and "leptothrix," by mere elongation and division by transverse septa, the observer named declares that these simple filaments have formerly received generic and specific names (*Leptothrix parasticha*

FIG. 13.—*Gramothrix luteolans* *a* to *e*, coccii in spores; *a*, *d*, and *e*, dividing, *f* to *n*, filamentous stages. The filaments vary in shape, diameter, &c., and are fixed below, *a* to *n* as seen in the common investing sheath, *m* and *p*, the segments separating and escaping, in *n* the segments divide up still further before escaping as minute cocci. *B*, *Gramothrix luteolans* 1, a group of attached filaments ($\times 640$). 2, a filament breaking up, 3, 4, 5, portions of filaments treated with methyl-violet so as to show the septa, which are usually obscured by the muphi granules in the filaments; in 5 some of the segments are undergoing longitudinal as well as transverse divisions prior to forming cocci (spores), 6, cocci becoming isolated ($\times 600$)

FIG. 14.—*Leptothrix alba* (After Zopf) 1, a group of attached filaments ($\times 640$). 2, a filament breaking up, 3, 4, 5, portions of filaments treated with methyl-violet so as to show the septa, which are usually obscured by the muphi granules in the filaments; in 5 some of the segments are undergoing longitudinal as well as transverse divisions prior to forming cocci (spores), 6, cocci becoming isolated ($\times 600$)

and *L. ochracea*, Kutz.) Certain of the threads then partially break up, and the portions become slightly displaced from the linear series, these portions go on growing in a direction at an angle with the previous one, but still in contact, and thus produce the "false-branching" to which *Cladothrix* owes its name. Finally the filaments break up into segments corresponding with the septa which have been formed across them. This fragmentation is peculiar in that the filaments separate first into shorter filaments, then into rodlets, and finally into "cocci." Portions of the filaments or branches may become separated and travel with a gliding movement, or even become more active and swarm by means of cilia. Such portions may break up into shorter filaments or rods which also

Vorlesungen über Bakterien, 1885. The enormous and scattered literature on the morphology of Schizomycetes is collected to a great extent in the works cited

swarm. But, in addition to these straight and more or less rigid forms (which, it will be noticed, simulate Thienberg and Cohn's "genera" *Micrococcus*, *Bacterium*, *Bacillus*, and *Leptothrix* so closely that any of them observed alone would undoubtedly have been formerly placed apart in one of those "genera"), it is interesting to find that some of the filaments become spirally twisted and simulate *Spirillum*, *Sporichate*, and *Vibrio*, the distinctions depending on the relative length and thickness of the filament, and the closeness or steepness of the coils. Moreover these twisted filaments also break up into shorter gliding or ciliated portions, which at length fall into rodlets and "cocci" as before.

A branched zoogloea form also occurs, and this contains cocci, bacterium-like or bacillar rods, or filaments resembling *Leptothrix* or *Vibrio* according to circumstances. In Lankester's *Bacterium rubescens* we have another species which is variable in a high degree. Many other Schizomycetes have now been shown to be more

FIG. 15.—*Begonia alba*. (After Zopf.)
A, Curved and spiral forms. B, separated spirally-wound pieces, which are breaking up still further in H. C, D, male sporidia form with a cilium at each end. (X 240)

or less pleomorphic, and the researches of Lankester, Nageli, Zopf, Miller, Kurth, De Bary, and others have laid the foundation for a knowledge of the circumstances which induce the changes in form referred to, it is at least certain that alterations in the nutritive medium, in the quantity of oxygen at the disposal of the organism, and in the temperature, &c., play their part in the matter.

It by no means follows, however, that because some species are pleomorphic all must be so, and still less that no species of Schizomycetes—or only one—exist at all those who deny the existence of species among the Schizomycetes on the evidence to hand must,

FIG. 16.—*Cladotrix dichotoma*. A, branched plant, the branches in part spiral and of the form known as *Vibrio* (a) or *Spirillum* (b) (slightly magnified). B, a long coiled branch more highly magnified. C, portion of branch resembling *Spirillum* at one end and *Vibrio* at the other. D, coiled branches, a, not segmented, b, c, segmented into rodlets and cocci. E, *Sporichate*-like portions breaking up into rodlets and cocci.

to be logically consistent, deny the existence of species altogether. But even if that be allowed, some name of similar intention must be employed to denote any group

of organisms which within our experience exhibit periodical repetitions of a process of development, i.e., all the individuals of successive generations go through the same phases periodically. It matters not that variations—ill-defined deviations from an average or "type"—occur on the part of individuals or generations, the periodically repeated life-history or development marks what we term a species.

The difficulties presented by such minute and simple organisms as the Schizomycetes are due partly to the few "characters" which they possess, and partly to the dangers of error in manipulating them, it is anything but an easy matter either to trace the whole development of a single form or to recognize with certainty any one stage in the development unless the others are known. This being the case, and having regard to the minuteness and ubiquity of these organisms, we should be very careful in accepting evidence as to the continuity or otherwise of any two forms which falls short of direct and uninterrupted observation. The outcome of all these considerations is that, while recognizing that the "genera" and "species" as defined by Cohn must be recast, we are not warranted in uniting any forms the continuity of which has not been directly observed, or, at any rate, the strictest rules should be followed in accepting the evidence adduced to render the union of any forms probable.¹

CLASSIFICATION.—The limits of this article prevent our examining in detail the system of classification proposed by Cohn, caton, or the modifications of it followed by other authorities. Zopf, in the third edition of his work (1885), proposes a scheme based on the modern views as to the pleomorphism we must refer to the original for the details, simply remarking that, apart from the extreme views accepted by the author, his system is impracticable to a degree and recognized by him as provisional only. Indeed any such classification must be provisional, for we are at the threshold only of a knowledge of the Schizomycetes.

The best starting-point for a modern classification of these organisms is that suggested by De Bary—the two modes of formation of the spores,—and as a provisional scheme, and simply to facilitate comparison of the groups, we might perhaps employ De Bary's two groups, and a third one to include those simple forms which show no trace of spore-formation. Many gaps exist, and many changes will probably have to be made. Meanwhile it might be advisable to classify the Schizomycetes provisionally as follows:—

GROUP A. Aspores

There are no spores distinct from the vegetative cells

I COCCACEÆ (figs 6 and 7)

Genera. 1, *Micrococcus* (and *Streptococcus*), 2, *Sarcina* (and Zopf's *Mesamorphia*), 3, *Ascoscoccus*

GROUP B. Arthrospores (De Bary)

The vegetative cells differ in shape, size, growth, or other characters from the spores: the latter are produced by segmentation

II ARTHROBACTERIACEÆ

Genera. 4, *Bacterium* (fig 8), 5, *Leuconostoc*, 6, *Sporichate* (?)

III LEPTOTRICHACEÆ

Genera. 7, *Oreanotrix* (fig 13), 8, *Begonia* (figs 14 and 15); 9, *Phragmidotrix* (?), 10, *Leptotrix*

IV CLADOTRICHACEÆ

Genus 11, *Cladotrix* (fig 16)

GROUP C. Endospores (De Bary)

Genera. 12 (figs 9–12), *Bacillus* (and *Clostridium*); 13, *Vibrio* (?), 14, *Spirillum* (at least in part)²

Fermentation and Putrefaction.—The growth and development of a Schizomycete in any organic medium results in a building-up of the complex food-materials into simpler bodies, which may then become oxidized and further decomposed. Such processes are known as fermentation. The value of fermentation as a putrefactive kind of fermentation depends on the medium and on the species of Schizomycete, and may be affected by other circumstances, as the process goes on volatile substances may escape and the residue remain behind. In some instances the residue is being decomposed by Schizomycetes and evil-smelling gases are being developed. Fermentation is spoken of as putrefaction, in certain cases, where intense oxidation follows, and still further consumes the products of decomposition, the process has been termed *fermocautis*. In a few cases a product of fermentation is precipitated and is further decomposed by *Beggiatoa*. The theory of FERMENTATION (*q.v.*) cannot be treated in detail here, but it is important to note that side by side with the actions referred to another kind of action may go on. Many Schizomycetes excrete what are called "soluble products," which are the outcome of the action of the organism on sugar into glucose, and so on. These processes of inversion, &c., result simply in an alteration of the protoid, &c., from the non-diffusible and non-as-similable condition to the diffusible and assimilable one, and as it is so very destructive as to the fermentations described, it is the outcome of the action of the organism on all such cases of fermentation, the one series of changes renders

the medium less and less capable of supporting life at every stage, the other series does not do so, yet the same name is frequently given to both kinds of action. It is a curious fact that the same *Schizomyces* may produce a different fermentation in each of two different media. The various fermentations are distinguished and valued according to the products which result, these by-products are usually injurious to the ferment organism as they accumulate, and often complicate the investigation.

Of important fermentations due to Schizomycetes may be mentioned those concerned in the making of vinegar and cheese, in the preparation of flax, hemp, &c., in the souring and diseases of beer, wines, &c., the destruction of sugars, preserved food, &c. Others are of importance in the soil, and in the destruction of organic matter in ponds, rivers, drains, &c. In fact, much of the *raison d'être* of sanitary science may be referred here, and it may turn out to be still more true than we now know that Schizomycetes are important in agriculture.

In pathology the changes due to these organisms are in length being fully recognized. Apart from the comparatively harmless lesions, actions of these forms normally existing in the alimentary canal. *Lepidoptera*, acids in the decay of teeth, etc.—it is now certain that the same organisms cause the diseases of man and animals. Schizomycetes when introduced into open wounds, &c., against which the brilliant labours of Lister have been so successfully directed, are acknowledged everywhere, but it is important to recognize that on the whole the diseases due to organisms in the digestive tract, fundamental in the changes of the same category as those referred to above, would be due to pathogenic Schizomycetes complicated conditions, the action of a pathogenetic Schizomycete cannot be treated and studied simply as a typical fermentation, but, although the conditions presented are involved and unusual, it cannot be doubted that common principles lie at the bases thereof, and that the study of such diseases of organisms must be treated, if not as a specialty, as fermentable media.

Numerous other fermentations of scientific interest are due to Schizomycetes *e.g.*, those in which colours are formed, certain cases of phosphorescence, the ammoniacal fermentation of urine, &c.¹

RELATIONS TO DISEASE.—The presence of Schizomycetes in the blood, tissues, or organs of animals and man suffering from certain specific diseases is admitted, and has naturally suggested the question—Are they accomplices only or have they any causal relations to the diseased conditions? Their constancy in given cases excluded the former view. Next arose the discussion as to how the causal connexion comes about and in what it consists, a discussion which is still going on as to the details. The chief points now established may be expressed generally somewhat as follows.

In a given specific disease, due to the action of a definite Schizomycete, the latter may be conceived to be injurious in

usual way, it enters the blood or tissues of oxygen or of any other valuable constituent, or if its activity results in the excretion of poisonous substances or in their formation as products of degradation of the matrix, or if it simply acts most of all as a mechanical obstruction or irritant,—in any of these cases it may result in the deliberately adjusted organism of the host. It being, however, a parasite, it is not to be expected that the parasite itself, then, its rapid growth and multiplication inside cannot conveniently be explained as due to their success in the patria there met with, and are indications that they produce change there which must result in abnormality so far as the host is concerned. Therefore, not alone the matter, however, — The living tissues of a healthy animal are extremely rich in water, and those of the parasite are invaded, and it is now generally admitted that the administration of a Schizomycete into an animal does not necessarily cause disease. Were it otherwise it is difficult to see how the higher organisms could escape at all. Schizomycetes abound all over, about and around us, many, of course, are unable to live in the fluids of the body, but many are able to do so. Something must, therefore be done to explain the fact that the Schizomycetes do not cause disease, — "least" the attempts of a Schizomycete to settle, grow, and multiply with fatal effect. Much can undoubtedly be explained by this struggle for existence between the cells of the parasite and those of the healthy tissues invaded. But the higher organisms, again, present obstacles of other kinds to the onslaught of Schizomycetes. They are not so rich in water, and they are not so rich in tissue-formations, — i. e., may be mentioned. This not at all Schizomycetes met with in the body can do harm.

But even when a Schizomycete has gained access to the blood-vessels, lymph-passages, &c., and has succeeded in establishing itself and multiplying, there are other factors to be taken into account before we dismiss the question as to its relations to disease. The rapidity of its growth may vary according to many circumstances,—temperature, oxidation, &c,—as well as the still partially obstructive action of the invader organism, whether the parasite be a bacillus or a fungus. It is also to be remembered that the agents of any kind, it is clear that everything which favours it aids in intensifying its action. And this may be local or general also according to complex circumstances. Of course sores, open wounds, &c., may render the access of a given Schizomycete very easy, and pave the way for its success in the tissues, &c.; different strata of which may be exerting less and less resistance to its attacks. The study of this subject has led to the methods of modern surgery devised by Lister, which may be mentioned here, as they are of such importance in the treatment of the tissues of wounds are not necessarily able to live in the healthy organism, however deadly the poisonous products of their action may be when they succeed in establishing themselves.

All these and many other facts, then, point to the conclusion that the mere presence of a Schizomycete in an organ or tissue is not sufficient proof of its causal relation to disease, and lead us to the following requirements to be satisfied before any such relation can be admitted (Koch)—(1) given a specific disease in which a definite Schizomycete is constantly detected, and with a constant disposition with respect to the tissues, organs, &c.,—this organism should be absent from animals free from the disease, (2) the Schizomycete should be cultivated in nutrient media outside the animal body, and produce "generations" and obtained in some quantity by these means, (3) inoculation of a small amount of this pure cultivation should reproduce the specific disease in a healthy animal, (4) the same foreign elements as before should be clearly detected in the tissues of the now diseased subject, and in the same relations as before.

The satisfaction of all these requirements is difficult, and the necessity of overcoming the difficulties has led to what may almost be termed a special branch of medical art. At the same time the majority of the principles which are here becoming recognized have long been known to hygienists, and especially to bacteriologists, and the present state of matters is rather one of more training on the part of writers on these subjects. It is impossible here to even mention all the methods devised for staining, preparing, and examining tissues, &c., and the Schizomycetes they contain, or for cultivating these minute organisms under constant conditions on sterilized potatoes, bread-paste, jelly, blood-serum, &c., or in any of the numerous fluids which have been referred to. The points in cultivation have already been mentioned, and the literature must be consulted for further details. (H. M. W.)

SCHLAGINTWEIT-SAKUNLUNSKI, HERMANN VON (1896-1882), the eldest of a band of brothers, all more or less noted as scientific explorers or students of foreign countries, sons of an oculist of Munich. Hermann was born on the 13th of May 1826. His first scientific labours were studies in the Alps, carried on between 1846 and 1848 in association with his brother Adolf (born January 9, 1829). The publication of the *Studien über die physikalische Geographie der Alpen* in 1850 founded the scientific reputation of the two brothers, and their reputation was increased by their subsequent investigations in the same field, in which the third brother Robert (born Oct. 27, 1837) also took part. Soon after the publication of the *Neue Untersuchungen über die phys. Geog. u. Geol. der Alpen* (1854, 4to), the three brothers received, on the recommendation of Alex. von Humboldt, a commission from the East India Company to travel for scientific purposes in their territory, and more particularly to make observations on terrestrial magnetism. Their explorations extended over the period 1854-57, during which they travelled, sometimes in company, sometimes separately, in the Deccan and in the region of the Himalayas, even prosecuting their investigations beyond the frontiers of the Company's territory into the region of the Karakorum and Kuenlun Mountains. Hermann and Robert were the first Europeans who crossed the latter mountains, and it was in honour of that achievement that the former had the title or surname of Sakunlunski bestowed upon him (in 1864). The two returned to Europe in the summer of 1857, but Adolf, who remained to prosecute his explorations in Central Asia, was put to death by the emir of Kashgar on the 26th of August. Between 1860 and 1866 Hermann and Robert published in four volumes the "Results of a Scientific Mission to India and High Asia." The extensive collections of ethnography and natural history made by them were ultimately deposited in the Burg at Nuremberg through the intervention of the king of Bavaria (May 1877). Hermann spent the last years of his life chiefly in literary and scientific activity, partly at Munich partly at the castle of Jägerburg near Forchheim. He died at Munich on the 19th of January 1882.

His brother Robert was appointed professor of geography at Gießen in 1864, but his academical labours were sometimes interrupted by travels, especially in the United States, which furnished him with material for more or less important works. He died at Gießen, June 8, 1885. Of two other brothers, one, Edward (born March 23, 1831), killed in battle at Kissingen in 1866, made himself known by an account of the Spanish expedition to Motococo in 1859-60. Emil (born July 7, 1835) is the author of several learned works relating to India and Tibet.

SCHLANGENBAD See SCHWALBACH.

SCHLEGEL, AUGUST WILHELM VON (1767-1845), German poet, translator, and critic, was born on the 8th September 1767 at Hanover, where his father, J. Adolf Schlegel, was a pastor. He was educated at the Hanover gymnasium and at the university of Göttingen. Having spent some years as a tutor in the house of a banker at Amsterdam, he went to Jena, where he was made a professor, and received from the duke of Weimar the title of "Rath." Here he began his translation of Shakespeare, which was ultimately completed, under the superintendence of Tieck, by Tieck's daughter Dorothea and Count Baudissin. A revised edition of this rendering, which is considered one of the best poetical translations in the German language, has been issued by the German Shakespeare society. At Jena Schlegel contributed to Schiller's periodicals the *Horen* and the *Musenalmannach*; and with his brother Friedrich he conducted the *Athenäum*, which ranked among the most powerful organs of critical opinion in Germany. He also published a volume of poems, and carried on a rather bitter controversy with Kotzebue. At

this time the two brothers were remarkable for the vigour and freshness of their ideas, and commanded respect as the leaders of the rising Romantic school. In 1802 Schlegel went to Berlin, where he delivered lectures on art and literature, and in the following year he issued *Ion*, a tragedy in the antique style, which gave rise to a suggestive discussion on the principles of dramatic poetry. About the same time appeared his *Spanish Theatre*, in which he presented admirable translations of five of Calderon's plays, and in another volume he gave translations of Spanish, Portuguese, and Italian lyrics. In 1807 he attracted much attention in France by an essay in the French language, in which he compared Racine with Euripides. His lectures on dramatic art and literature, which have been translated into most European languages, were delivered at Vienna in 1808. Meanwhile he had been travelling in France, Germany, Italy, and other countries with Madame de Staël, who owed to him many of the ideas which she embodied in her work, *De l'Allemagne*. In 1813 he acted as the secretary of the crown prince of Sweden, through whose influence the right of his family to noble rank was revived. Schlegel was made a professor at the university of Bonn in 1818, and during the remainder of his life he occupied himself chiefly with Oriental studies, although he continued to lecture on art and literature, and in 1828 he issued two volumes of critical writings. In 1823-30 he published the *Indische Bibliothek*, and as separate works appeared (1823) the *Bhagavad-Gita* with a Latin translation, and (1829) the *Rāmāyana*. Schlegel was twice married—first to a daughter of Prof. Michaelis of Göttingen, then to a daughter of Prof. Paulus of Heidelberg. Both wives separated from him soon after their marriage. He died at Bonn on the 12th May 1845. As an original poet Schlegel is unimportant, but as a poetical translator he has rarely been excelled, and in criticism he exercised a strong influence by the emphasis with which he marked the distinction between classical and romantic literature. By his study of Sanskrit he helped to prepare the way for the development of the science of language.

In 1846-47 Schlegel's German works were issued in twelve volumes by Bocking. There is also an edition of his *Essays, de l'et en Français*, and of his *Opuscula Latina*.

SCHLEGEL, JOHANN ELIAS (1718-1749), a German dramatic writer, was born at Meissen on the 28th January 1718. He was educated at Schulpforta and at the university of Leipzig. In 1743, having finished his studies, he became private secretary to his relative, Von Spener, the Saxon ambassador at the Danish court. Afterwards he was made professor extraordinary at the academy of Soroe, where he died on the 13th August 1749. Schlegel was a contributor to the *Bremischen Beiträge*, and for some time, while he was living in Denmark, he edited a weekly periodical, *Der Fremde*. He was also known as a writer of clever poetical epistles. Incomparably his best works, however, are his dramas, which did much to prepare the way for the dramatic achievements of Lessing, by whom his genius was warmly appreciated. He wrote two lively and well-constructed comedies, the *Trumph der guten Frauen* and the *Stumme Schönheit*, the latter in alexandrines, the former in prose. *Hermann and Kunst* (in alexandrines) are generally considered his best tragedies.

His works were edited after his death by his brother, J. H. Schlegel, who had a considerable reputation as a writer on Danish history. Another brother, J. Adolf Schlegel, an eminent preacher, and author of some volumes of verse, was the father of August Wilhelm and Friedrich von Schlegel.

SCHLEGEL, KARL WILHELM FRIEDRICH VON (1772-1829), known chiefly as an historian of literature, was the brother of August Wilhelm von Schlegel. He was born

at Hanover on the 10th March 1772 Having studied at Göttingen and Leipzig, he attracted some attention by a book on the *Griechen und Römer* (1797), which was praised by Heyne This work was soon followed by his *Geschichte der Poesie der Griechen und Römer* At Jena, where he lectured as a privat-docent at the university, he contributed to the *Athenäum* many striking critical articles, and a number of lyrical poems which were afterwards included in a volume entitled *Gedichte* Here also he wrote *Lucinde*, an unfinished romance, which was held by some of the best of his contemporaries to be of a deeply immoral tendency, and *Alvico*, a tragedy, in which he attempted without much success to combine romantic and classical elements In 1802 he went to Paris, where he edited *Europa*, lectured on philosophy, and carried on Oriental studies, some results of which he embodied in a well-known book, *Ueber die Sprache und Weisheit der Indier* In 1803 he and his wife joined the Roman Church, and from this time he became more and more opposed to the principles of political and religious freedom He went to Vienna in 1808, and in the following year was engaged as imperial court secretary at the headquarters of the archduke Charles At a later period he was for some time councillor of legation in the Austrian embassy at the Frankfurt diet, but in 1818 he returned to Vienna Meanwhile he had published two series of lectures, *Ueber die neuere Geschichte* (1811) and *Geschichte der alten und neuen Literatur* (1815) After his return to Vienna from Frankfurt he edited *Concordia*, and began the issue of his *Sammtliche Werke* He also delivered lectures, which were republished in his *Philosophie des Lebens* (1828) and in his *Philosophie der Geschichte* (1829) He died on the 11th January 1829 at Dresden, where he was delivering the course of lectures which appeared in 1830 under the title *Philosophische Vorlesungen, insbesondere über die Philosophie der Sprache und des Wortes* His own collection of his works included ten volumes, and to this number five volumes were added after his death A permanent place in the history of German literature belongs to Friedrich Schlegel and his brother August Wilhelm as the critical leaders of the Romantic school, which derived from them most of its governing ideas as to the characteristics of the Middle Ages, and as to the methods of literary expression In their writings, too, there is the fullest and most impressive statement of the mystical spiritual doctrines of the Romantic school Of the two brothers, August Wilhelm did the highest permanent service to his countrymen by his translations from Shakespeare and Calderon The best of Friedrich's works is his *Geschichte der alten und neuen Literatur*, in which was presented for the first time a systematic account of the development of European literature as a whole

Friedrich Schlegel's wife, Dorothea, a daughter of Moses Mendelssohn, was born at Berlin about the year 1770, and died at Frankfurt in 1839 She was an eccentric but remarkably clever woman, and wrote or edited several works, issued by her husband, — the unfinished romance *Florentin* (1801), the first volume of the *Sammlung romantischer Dichtungen des Mittelalters* (2 vols, 1804), and *Loher und Malter* (1805) By her first marriage she had a son, Philip Veit, who became one of the most eminent painters of his day in Germany

SCHLEICHER, AUGUST (1821–1868), born at Meiningen on February 19, 1821, studied at the universities of Leipzig and Tübingen, became extraordinary professor of philology in Prague in 1850, removed to Jena as ordinary professor in 1857, and died there December 6, 1868. His work is characterized in the article PHONOLOGY, vol. xvii p 782

SCHLEIDEN, MATTHIAS (1804–1881), was born at Hamburg in 1804 He studied law at Heidelberg and

practised as advocate in Hamburg till 1831, but not succeeding he studied botany and medicine at Göttingen and Berlin, and graduated in Jena in 1839, where he afterwards became professor of botany (1846–50). In 1863 he was called to Dorpat, but resigned the following year and returned to Germany, where he lived as a private teacher He died at Frankfurt in 1881 His title to remembrance is twofold Uniting the labours of two centuries of workers in vegetable histology, from Malpighi and Grew to Mirel and Robert Brown, he proved that a nucleated cell is the only original constituent of the plant embryo, and that the development of all vegetable tissues must be referred to such cells, thus preparing the way for the epoch-making cell theory of Schwann, and his *Principles of Scientific Botany*, which went through several editions (1842–50), did much to shake the tyranny of the purely systematic Linnæan school, whose accumulations he was accustomed irreverently to describe as "hay" Despite a certain inability to criticize and verify his own hypotheses, he gave, both by his speculative activity and by the introduction of improved technical methods, so vivid an impulse to the younger botanists of his time as to have earned from De Bary the title of reformer of scientific botany His botanical labours practically ceased after 1850, when he entered on various philosophical and historical studies See SCHWANN

SCHLEIERMACHER, FRIEDRICH DANIEL ERNST (1768–1834), theologian and philosopher, was the son of a Prussian army-chaplain of the Reformed confession, and was born November 21, 1768, at Breslau In his fifteenth year the boy, who was of a weak constitution, was placed by his parents in a Moravian school at Niesky in Upper Lusatia, and two years later in the seminary of the same sect at Barby near Halle Here Moravian theology proved inadequate to satisfy the deep religious needs and awakening intellect of the youth It was particularly the doctrines of eternal punishment, of the deity and the substitutionary sufferings of Christ, and of the total corruption of human nature that were stumbling-blocks to him He was also unable to make his own the peculiar religious experiences of his Moravian and pietistic teachers The efforts of his strictly orthodox father and of the heads of the seminary to lead him to crush his doubts as sinful, and to shun modern theology and literature, tended only to strengthen his desire to explore the great world of knowledge Reluctantly his father gave him permission to leave Barby for the university of Halle, and the correspondence between the father and the son on this painful crisis in Friedrich's life supplies a striking illustration of a typical phase of distressing modern mental history When Schleiermacher entered the university of Halle (1787) the reign of pietism there had ceased, having given way to the rationalistic philosophy of Wolf with the critical theology of Semler, though the new philosophy of Kant was rapidly displacing Wolf's As a student he pursued an independent course of reading and neglected to his permanent loss the study of the Old Testament and the Oriental languages But he frequented the lectures of Semler and of J. A. Eberhard, acquiring from the former the principles of an independent criticism of the New Testament and from the latter his love of Plato and Aristotle At the same time he studied with great earnestness the writings of Kant and Jacobi He commenced thus early his characteristic habit of forming his opinions by the process of patiently examining and weighing the positions of all thinkers and parties But with the receptivity of a great eclectic he combined the reconstructive power of a profoundly original thinker While yet a student he began to apply ideas gathered from the Greek philosophers in a reconstruction of Kant's system The completion

of his three years' course at Halle he obtained through the influence of the court-chaplain Ecké an appointment as private tutor in the family of Count Dohna-Schlöbitten, which he held upwards of two years, developing in a cultivated and aristocratic household his deep love of family and social life. After short engagements in tuition and as *lectura tenens* to a clergyman of the small town of Landsberg, he received (1796) the appointment of chaplain to the Charité Hospital in Berlin, a position which he held nearly six years, and which offered no scope for the development of his powers as a preacher. He was, the more induced to seek the satisfaction of his mental and spiritual necessities in the cultivated society of Berlin, and in profound philosophical studies. This was the period in which he was constructing the framework of his philosophical and religious system. It was the period too when he made himself widely acquainted with art, literature, science, and modern culture generally. He was at that time profoundly affected by German Romanticism, as represented by his friend Friedrich Schlegel, and it required all the energy of his moral nature and the force of his intellect to preserve himself from its moral and mental extravagances. Of this his *Confidential Letters* on Schlegel's *Lucinde* (1801), as well as his perilous relation to Eleonore Grunow, the wife of a Berlin clergyman, are proof and illustration. Gradually his sound moral nature, his deep religiousness, and his powerful intellect enabled him to emancipate himself entirely from the errors and weaknesses of a transient phase of mental and social history, and to appropriate at the same time the elements of truth and goodness which it possessed in rich measure. Romanticism unlocked for him the divine treasures of life and truth which are stored in the feelings and intuitions of the human soul, and thus enabled him to lay the foundations of his philosophy of religion and his ethical system. It enriched his imagination and life too with ideals ancient and modern, which gave elevation, depth, and colour to all his thought. Meantime he studied Spinoza and Plato, and was profoundly influenced by both, though he was never a Spinozist; he made Kant more and more his master, though he departed on fundamental points from him, and finally remodelled his philosophy; with some of Jacobi's positions he was in sympathy, and from Fichte and Schelling he accepted ideas, which in their place in his system, however, received another value and import. The literary fruit of this period of intense fermentation and of rapid development was his "epoch-making" book, *Reden über die Religion* (1799), and his "new year's gift" to the new century, the *Monologen* (1800). In the first book he vindicated for religion an eternal place amongst the divine mysteries of human nature, distinguished it from all current caricatures of it and allied phenomena, and described the perennial forms of its manifestation and life in men and society, giving thereby the programme of his subsequent theological system. In the *Monologen* he threw out his ethical manifesto, in which he proclaimed his ideas as to the freedom and independence of the spirit, and as to the relation of the mind to the world of sense and imperfect social organizations, and sketched his ideal of the future of the individual and society. In 1802, to his great advantage morally and intellectually, Schleiermacher exchanged the brilliant circle of Berlin Romanticists for the retired life of a pastor in the little Pomeranian town of Stolpe. Here he remained two years, which were full of pastoral and literary work, as well as rich in personal and moral progress. He relieved Friedrich Schlegel entirely of his nominal responsibility for the translation of Plato, which they had together undertaken, and regarded the completion of it as the work of his life. The first volume was published in 1804, and the last (the

Republic) in 1823. At the same time another work, *Gründlinien einer Kritik der bisherigen Sittenlehre* (1803), the first of his strictly critical and philosophical productions, occupied him. This work is a severe criticism of all previous moral systems, especially those of Kant and Fichte, Plato's and Spinoza's finding most favour, its leading principles are that the tests of the soundness of a moral system are the completeness of its view of the laws and ends of human life as a whole and the harmonious arrangement of its subject-matter under one fundamental principle, and, though it is almost exclusively critical and negative, the book announces clearly the division and scope of moral science which Schleiermacher subsequently adopted, attaching prime importance to a 'Gutelehre,' or doctrine of the ends to be obtained by moral action. But the obscurity of the style of the book as well as its almost purely negative results proved fatal to its immediate success. In 1804 Schleiermacher removed as university preacher and professor of theology to Halle, where he remained until 1807, and where he quickly obtained a reputation as professor and preacher, and exercised a powerful influence in spite of the contradictory charges of his being an atheist, Spinozist, and pietist. In this period he wrote his dialogue the *Nachmächte* (1806), a charming production, which holds a place midway between his *Reden* and his great dogmatic work the *Christliche Glaube*, and presents in the persons of its speakers phases of his growing appreciation of Christianity as well as the conflicting elements of the theology of the period. After the battle of Jena he returned to Berlin (1807), was soon appointed pastor of the Trinity Church there, and the next year married the widow of his friend Wilhelm. At the foundation of the Berlin university (1810), in which he took a prominent part, he was called to a theological chair, and soon became secretary to the Academy of Sciences. He was thus placed in a position suited to his powers and in domestic and social surroundings adapted to meet the wants of his rich nature. At the same time he approved himself in the pulpit and elsewhere as a large-hearted and fearless patriot in that time of national calamity and humiliation, acquiring a name and place in his country's annals with Arndt, Fichte, Stein, and Schopenhörst. He took a prominent part too in the reorganization of the Prussian church, and became the most powerful advocate of the union of the Lutheran and Reformed divisions of German Protestantism. The twenty-four years of his professional career in Berlin were opened with his short but important outline of theological study (*Kurze Darstellung des theologischen Studiums*, 1810), in which he sought to do for theology what he had done for religion in his *Reden*. While he preached every Sunday, he also gradually took up in his lectures in the university almost every branch of theology and philosophy—New Testament exegesis, introduction to and interpretation of the New Testament, ethics (both philosophic and Christian), dogmatic and practical theology, church history, history of philosophy, psychology, dialectics (logic and metaphysics), politics, pedagogy, and aesthetics. His own materials for these lectures and his students' notes and reports of them are the only form in which the larger proportion of his works exist,—a circumstance which has greatly increased the difficulty of getting a clear and harmonious view of fundamental portions of his philosophical and ethical system, while it has effectually deterred all but the most courageous and patient students from reading these posthumous collections. As a preacher he produced a powerful effect, yet not at all by the force of his oratory but by his intellectual strength, his devotional spirit, and the philosophical breadth and unity of his thought. In politics he was an earnest friend of

liberty and progress, and in the period of reaction which followed the overthrow of Napoleon he was charged by the Prussian Government with 'denaogogic agitation' in conjunction with the great patriot Arndt. At the same time he prepared for the press his chief theological work *Der christliche Glaube nach den Grundsätzen der evangelischen Kirche* (1821-22, 2d edition, greatly altered, 1830-31). The fundamental principle of this classical work is, that religious feeling, the sense of absolute dependence on God as communicated by Jesus Christ through the church, and not the creeds or the letter of Scripture or the rationalistic understanding, is the source and law of dogmatic theology. The work is therefore simply a description of the facts of religious feeling, or of the inner life of the soul in its relations to God, and these inward facts are looked at in the various stages of their development and presented in their systematic connexion. The aim of the work was to reform Protestant theology by means of the fundamental ideas of the *Reden*, to put an end to the unreason and superficiality of both supernaturalism and rationalism, and to deliver religion and theology from a relation of dependence on perpetually changing systems of philosophy. Though the work added to the reputation of its author, it naturally aroused the increased opposition of the theological schools it was intended to overthrow, and at the same time Schleiermacher's defence of the right of the church to frame its own liturgy in opposition to the arbitrary dictation of the monarch or his ministers brought upon him fresh troubles. He felt himself in Berlin more and more isolated, although his church and his lecture-room continued to be largely attended. But he prosecuted his translation of Plato and prepared a new and greatly altered edition of his *Christliche Glaube*, anticipating the latter in two letters to his friend Lucke (in the *Studien und Kritiken*, 1829), in which he defended with a mastery half his theological position generally and his book in particular against opponents on the right and the left. The same year he lost his only son—a blow which, he said, "dove the nails into his own coffin." But he continued to defend his theological position against Hegensteinberg's party on the one hand and the rationalists Von Cölln and D. Schulz on the other, protesting against both subscription to the ancient creeds and the imposition of a new rationalistic formulæ. In the midst of such labours, and enjoying still full bodily and mental vigour, he was carried off after a few days' illness by inflammation of the lungs. He died thinking "the profoundest speculative ideas which were one with his deepest religious feeling," and partaking of the sacrament of the Lord's supper, February 12, 1834.

Schleiermacher's friend, the naturalist and poet Steffens, has left the following description of his appearance about the beginning of the century.—"Schleiermacher was of small stature, a little deformed, yet hardly enough to disfigure him; all his movements were animated, and his features in the highest degree expressive; a certain keenness in his glance produced perhaps a repellent effect, indeed, he appeared to see through every one; his face rather long, all his features sharply cut, the lips firmly closed, the chin projecting, the eyes animated and flashing, his look always serious, collected, and thoughtful."

Philosophical system

Schleiermacher's Philosophical System—A great antithesis lies at the basis of all thought and life—that of the real and the ideal, of organism, or sense, and intellect. But the antithesis is not absolute, for in life and being both elements are united—though without its presence life and thought would be impossible. In the actual world the antithesis appears as reason and nature, in each of which, however, there is a combination of its two elements—the ideal and the real,—the reason having a preponderance of the first and nature a preponderance of the second. At the basis of nature lies universal reason as its organizing principle, and when reason

becomes a conscious power in man it finds itself in conflict as well as in harmony with eternal nature. The whole effort and end of human thought and action is the gradual reduction of the realm and the power of this antithesis in the individual, the race, and the world. Though the antithesis is real and deep, the human mind cannot admit its absolute nature, we are compelled to suppose a transcendental reality of causity in which the real and the ideal, being and thought, subject and object, are one. Consciousness itself involves the union of the antithetical elements, and yet to moral action nature is found organism and reason manifested or symbolized therein. We are ourselves proofs of the unity of the real and the ideal, of thought and being, for we are both, our self-consciousness supplying the expression of the fact. As we have in ourselves an instance of the identity of thought and being, we must suppose a universal identity of the ideal and the real behind the antithesis which constitutes the world. This supposition is the basis of all knowledge, for thought becomes knowledge only when it corresponds to being. The supposition may be called a belief, but it is so only in the sense in which belief appears in the religious department, where it is the ultimate ground of all action. The supposition is the basis of all ethics, for without the conviction of the correspondence of thought and reality action would be false and in the end impossible. It is above all the substance of religious feeling, which is the immediate consciousness of the unity of the world, of the absolute oneness behind the infinite multiplicity of contrasts, indeed, it is the religious conviction of the unity which is the best guarantee of the truth of the suppositions of philosophy. It is "the religious consciousness of the unity of the intellectual and physical world in God" which is to overcome the scepticism of the critical philosophy. But though the unity of the world is the basis of knowledge, it is absolute and transcendental. In contrast with the "world," as the totality of being in its differentiation, this absolute unity, or God, in whom the real as manifold, and the spirit as one, find their unifying base, by its very nature is unphenomenal, undefinable, and inconceivable. The idea is outside the boundary of thought, though its necessary postulate, and it is no less inaccessible to feeling and reality than to thought. Life and soul. Neither member of the antithesis of the real and the ideal must be conceived as producing the other, they are both equally existent and equally constituent elements of the world, but in God they are one, and therefore the world must not be identified with Him. The world and God are distinct, but correlative, and neither can be conceived without the other. The world without God would be "chaos," and God without the world would be empty idealism. But though God is transcendent and unknowable He is immanent in the world. In self-consciousness God is present as the basis of the unity of our nature in every transition from an act of knowledge to an act of will, and *vice versa*. As far as man is the unity of the real and the ideal, God is in him. He is also in all things, inasmuch as in everything the totality of the world and its transcendental basis is presupposed by virtue of their being and correlation. The unity of our personal life amidst the multiplicity of its functions is the symbol of God's immanence in the world, though we may not conceive of the Absolute as a person. The idea of the world as the totality of being is, like the correlative idea of God, only of regulative value, it is transcendent, as we never do more than make approaches to a knowledge of the sum of being. The one idea is the transcendental *terminus a quo* and the other the transcendental *terminus ad quem* of all knowledge, and though the world cannot be exhaustively known it can be known very extensively, and though the positive idea of God must always remain unattainable we are able to reject those ideas which involve a contradiction of the postulate of the Absolute. Thus the pantheistic and the theistic conceptions of God as the supreme power, as the first cause, as a person, are alike unlawful, since they all bring God within the sphere of antithesis and preclude His absolute unity. On the other hand, the world cannot be known as the realm of antithesis, and it is the correlative of God. Though He may not be conceived as the absolute cause of the world, the idea of absolute causality as symbolized in it may be taken as the best approximate expression of the contents of the religious consciousness. The unbroken connexion of cause and effect throughout the world becomes thus a manifestation of God. God is to be sought only in ourselves and in the world. He is completely immanent in the universe. It is impossible that His causality should have any other sphere than the world, which is the totality of being. "No God without a world, and no world without God." The divine omnipotence is quantitatively represented by the sum of the forces of nature, and qualitatively distinguished from them only as the unity of infinite causality from the multiplicity of its finite phenomena. Throughout the world—not excepting the realm of mind—absolute necessity prevails. As a whole the world is as good and perfect as a world could possibly be, and everything in it, as occupying its necessary place in the whole, is also good, evil being only the necessary limitation of individual being.

Schleiermacher's psychology takes as its basis the phenomenal dualism of the ego and the non-ego, and regards the life of man as

the interaction of these elements with their interpenetration as its infinite destination. The dualism is therefore not absolute, and, though present in man's own constitution as composed of body and soul, is relative only even there. The ego is itself both body and soul,—the conjunction of both constitutes it, our "organization," or sense nature has its intellectual element, and our "intellect," its organic element. There is no such thing as a "pure mind" or a "pure body." The one general function of the ego, thought, becomes in relation to the non-ego either receptive or spontaneous action, and in both forms of action its organic, or sense, and its intellectual energies co-operate, and in relation to man, nature, and the universe the ego gradually finds its true individuality by becoming a part of them,—every extension of consciousness being higher life. The various functions of the ego, as determined by the relative predominance of sense or intellect, are either functions of the senses (or organism) or functions of the intellect. The former fall into the two classes of feelings (subjective) and perceptions (objective), the latter, according as the receptive or the spontaneous element predominates, into cognition and volition. In cognition being is the object and in volition it is the purpose of thought. In the first case we receive (in our flesh) the object of thought into ourselves; in the latter we plant it into the world. Both cognition and volition are functions of thought as well as forms of moral action. It is in these two functions that the real life of the ego is manifested, but behind them is *self-consciousness* permanently present, which is always both subjective and objective—consciousness of ourselves and of the non ego. This self-consciousness is the third special form or function of thought,—which is also called feeling and immediate knowledge. In it we receive our own life as affected by the non-ego. As the non-ego helps or hinders, enlarges or limits, our inner life, we feel pleasure or pain. Aesthetic, moral, and religious feelings are respectively produced by the reception into consciousness of large ideas,—nature, mankind, and the world, whose feelings are the sense of being one with these vast objects. Religious feeling therefore is the highest form of thought and of life, in it we are conscious of our unity with the world and God, it is thus the sense of absolute dependence. Schleiermacher's doctrine of knowledge accepts the fundamental principle of Kant that knowledge is bounded by experience, but it seeks to remove Kant's scepticism as to knowledge of the *Ding an sich*, or *Sein*, as Schleiermacher's terms it. The idea of knowledge or scientific thought as distinguished from the passive form of thought,—of aesthetic,—religious,—moral,—thought, is produced by all thinkers of the same kind and which corresponds to being. All knowledge takes the form of the concept (*Begriff*) or the judgment (*Urtheil*), the former conceiving the variety of being as a definite unity and plurality, and the latter simply connecting the concept with certain individual objects. In the concept therefore the intellectual and in the judgment the organic or sense element predominates. The universal uniformity of the production of judgments presupposes the uniformity of our relations to the outward world, and the uniformity of concepts rests similarly on the likeness of our inward nature. This uniformity is not based on the sameness of either the intellectual or the organic functions alone, but on the correspondence of the forms of thought and sensation with the forms of being. The essential nature of the concept is that it combines the general and the special, and the same combination occurs in being, in being the system of substantial or permanent forms answering to the system of concepts and the relation of cause and effect to the system of judgments, and the higher concept answering to "force" and the lower to the phenomena of force, and the judgment to the contingent interaction of things. The sum of being consists of the two systems of substantial forms and interactional relations, and it reappears in the form of concept and judgment, the concept representing being and the judgment representing action. Knowledge has under both forms the same object, the relative difference of the two being that when the conceptual form predominates we have speculative science and when the form of judgment prevails we have empirical or historical science. Throughout the domain of knowledge the two forms are found in constant mutual relations, another proof of the fundamental unity of thought and being or of the objectivity of knowledge. It is obvious that Plato, Spinoza, and Kant had constituted characteristic systems of thought, and to this system we are directly or indirectly it was largely indebted to Schelling for fundamental conceptions.

Ethics. Schleiermacher's *Ethics* is,—indeed, religion and theology it was to the moral world, of which, next, the phenomena of religion and theology were in his systems only constituent elements, that he specially devoted himself. In his earlier essays he endeavored to point out the defects of ancient and modern ethical thinkers, particularly of Kant and Fichte, Plato and Spinoza only finding favour in his eyes. He failed to discover in previous moral systems any necessary basis in thought, any completeness as regards the phenomena of moral action, any systematic arrangement of its parts, and any clear and distinct treatment of specific moral acts and relations. His own moral system is an attempt to supply

these deficiencies. It connects the moral world by a deductive process with the fundamental idea of knowledge and being, it offers a view of the entire world of human action which at all events aims at being exhaustive, it presents an arrangement of the matter of the science which tabulates its constituents after the model of the physical sciences, and it supplies a sharply defined treatment of specific moral phenomena in their relation to the fundamental idea of human life as a whole. Schleiermacher deems ethics as the theory of the nature of the reason, or as the scientific treatment of the effects produced by human reason in the world of nature and man. As a theoretical or speculative science it is purely descriptive and not practical, being correlated on the one hand to physical science and on the other to history. Its method is the same as that of physical science, being distinguished from the latter only by its matter. The ontological basis of ethics is the unity of the real and the ideal, and the psychological and actual basis of the ethical process is the tendency of reason and nature to unite in the form of the complete organization of the latter by the former. The end of the ethical process is that nature (*φύσις*, all that is not mind, the human body as well as the external nature) may become simply the perfect symbol and organ of mind. Consciousness, as the subjective expression of the presupposed identity of reason and nature in their bases, guarantees the practicability of our moral vocation. Nature is predestined or constituted to become the symbol and organ of mind, just as mind is endowed with the impulse to realize this end. But the moral law must not be conceived under the form of an "imperative" or a "Sollen"; it differs from a law and is a law in the doing rather than in the fact that it ranks the mind as conscious will, or *voluntas*, above nature. Strictly speaking, the antitheses of good and bad and of free and necessary have no place in an ethical system, but simply in history, which is obliged to compare the actual with the ideal, but as far as the terms "good" and "bad" are used in morals they express the rule or the contrary of reason, or the harmony or the contrary of the particular and the general. The idea of "free" as opposed to necessary expresses simply the fact that the mind can produce to itself ends, though a man cannot alter his own nature. In contrast to Kant and Fichte and modern moral philosophers Schleiermacher roundly and assigned pre-eminent importance to the doctrine of the *summum bonum*, or highest good. It represents in his system the ideal and aim of the entire life of man, supplying the ethical view of the conduct of individuals in relation to society and the universe, and answering completely to the philosophy of the same time. Starting with the idea of the highest good and of its constituent elements (*Beste*), or the chief forms of the union of mind and nature, Schleiermacher's system divides itself into the doctrine of moral ends, the doctrine of virtue, and the doctrine of duties, in other words, as a development of the idea of the subjection of nature to reason it becomes a description of the actual forms of the triumphs of reason, of the moral power manifested therein, and of the specific forms of its employment. Every moral good or product has a twofold character: it is individual and universal, it is an organ and symbol of the reason, that is, it is the product of the individual with relation to the community, and represents or manifests as well as classifies and rules nature. The first two characteristics provide for the functions and rights of the individual as well as those of the community or race. Though a moral action may have these four characteristics at various degrees of intensity it cannot be measured according to them. All moral products may be classified according to the predominance of one or the other of these characteristics. Universal organizing action produces the forms of intercourse, and universal symbolizing action produces the various forms of science, individual organizing action yields the forms of property and individual symbolizing action the various representations of feeling, all these constituting, as we have seen, the productive spheres, or the social conditions of moral action. Moral functions cannot be performed by the individual in isolation but only in his relation to the family, the state, the school, the church, and society,—all forms of human life which ethical science finds to its hand and leaves to the science of natural history to account for. The moral process is accomplished by the various sections of humanity in their individual spheres, and the doctrine of virtue deals with the reason as the moral power in each used actually by the totality of moral products is obtained. Schleiermacher classifies the virtues under the two forms of *Gesamtheit* and *Fortigkeit*, the first consisting of the pure ideal element in action and the second the form it assumes in relation to circumstances, each of the two classes falling respectively into the two divisions of wisdom and love and of intelligence and application. In his system the doctrine of duty is the description of the method of the attainment of ethical ends, the conception of duty as an imperative, or obligation, being excluded, as we have seen. No action fulfils the conditions of duty except as it combines the three following antitheses: reference to the moral idea in its whole extent and likewise to a definite moral sphere, connexion with existing conditions and at the same time absolute personal production; the fulfilment of the entire moral vocation every moment though

Schleswig-Holstein Between Friedrichsburg and Lollhus is the old chateau of Gottorp, now despoiled of its art treasures and used as barracks. The former commercial importance of the town has disappeared, and the Schlei now affords access to small vessels only. Fishing and the manufacture of a few articles of common use are the chief occupations of the inhabitants. The population in 1885 was 15,187, all Protestants except about 250 Roman Catholics and 70 Jews.

Schleswig (ancient forms *Shethlap*, *Slans*, *sluc*, *sic*, the town of bay of the Sles or Schlei) is a town of very remote origin, and seems to have been a trading place of considerable importance as early as the 9th century. It served as a medium of commercial intercourse between the North Sea and the Baltic, and was known to the old Arabian geographers. The first Christian church in this district was built here by Ansgarus about 850, and it became the seat of a bishop about a century later. The town also became the seat of the dukes of Schleswig, but its commerce gradually dwindled owing to the rivalry of Lübeck, the numerous wars in which the district was involved, and the siting up of the Schlei. At the partition of 1544 the old chateau of Gottorp, originally built in 1100 for the bishop, became the residence of the ducal or Gottorp line of Schleswig-Holstein, which continued here till expelled by Frederick IV. in 1713. From 1731 to 1846 it was the seat of the Danish governors of the duchies. In the wars of 1648 and 1654 Schleswig was an important strategical point on account of its proximity to the Daneværk, and was occupied by the different contending parties in turn. It has been the capital of Schleswig-Holstein since its incorporation by Prussia.

To the south of Schleswig are the scanty remains of the *Danewerk*, or *Danewerk*, a line of entrenchments between the Schlei and the Treene, believed to have been originally thrown up in the 8th century or even earlier, and afterwards repeatedly strengthened and enlarged. After the union of Schleswig and Holstein it lost its importance as a frontier defence, and was allowed to fall into disrepair. The Daneværk was stormed by the Prussians in 1848, but was afterwards so greatly extended and strengthened by the Danes that it would have been almost impregnable if defended by a sufficient number of troops. In the war of 1864, however, the Danish army was far too small for this task, and General de Meza abandoned the Daneværk without striking a blow, a step which caused deep disappointment to the Danes and led to the dismissal of the general. Since then the works have been entirely levelled.

SCHLESWIG-HOLSTEIN, a maritime province in the north-west of Prussia, formed out of the once Danish duchies of Schleswig-Holstein and Lauenburg, is bounded on the W by the German Ocean, on the N by Jutland, on the E by the Baltic, Lübeck, and Mecklenburg, and on the S by Mecklenburg and the lower course of the Elbe (separating it from Hanover). It thus consists of the southern half of the Cimbric peninsula, and forms the connecting link between Germany and Denmark. In addition to the mainland, which decreases in breadth from south to north, the province includes several islands, the most important being Alsen and Fehmarn in the Baltic, and Rom, Sylt, and Föhr in the North Sea. The total area of the province is 7280 square miles, 450 of which belong to the small duchy of Lauenburg in the south-east corner, while the rest are divided almost equally between Holstein to the south of the Eider and Schleswig to the north of it. From north to south the province is about 140 miles long, while its breadth varies from 90 miles in Holstein to 35 miles at the narrower parts of Schleswig.

Schleswig-Holstein belongs to the great North-German plain, of the characteristic features of which it affords a faithful reproduction in miniature, down to the continuation of the Baltic ridge or plateau (see GERMANY) by a range of low wooded hills skirting its eastern coast and culminating in the Bungsberg (870 feet), a little to the north of Eutin. This hills district contains the most productive land in the province, the soil consisting of glacial drift or boulder clay. The central part of the province forms practically a continuation of the great Lüneburg Heath, and its thin sandy soil is of little use in cultivation. Along the west coast extends the "Marsh-

land" a belt of rich alluvial soil formed by the deposits of the German Ocean, and varying in breadth from five to fifteen miles. It is seldom more than a few feet above the sea-level, while at places it is actually below it, and it has consequently to be defended by an extensive system of dykes or embankments, 25 feet high, resembling those of Holland. The more ancient geological formations are scarcely met with in Schleswig-Holstein. The contrast between the two coast-lines of the province is very marked. The Baltic coast, about 300 miles in length, has generally steep well-defined banks and is very irregular in form, being pierced by numerous long and narrow fjords, which run deep into the interior of the land and often afford excellent harbours. The islands of Alsen and Fehmarn are separated from the coast by very narrow channels. The North Sea coast (200 miles), on the other hand, is very low and flat, and its smooth outline is interrupted only by the estuary of the Eider and the peninsula of Eiderstedt. Dunes or sand-hills, though rare on the protected mainland, occur on Sylt and other islands, while the small unprotected islands called "Halligen" are being gradually washed away by the sea. The numerous islands on the west coast probably formed part of the peninsula at no very remote period, and the sea between them and the mainland is very shallow and full of sandbanks. The climate of Schleswig-Holstein is mainly determined by the proximity of the sea, and the mean annual temperature, varying from 45° Fahr in the north to 49° Fahr in the south, is rather higher than is usual in the same latitude. Rain and fog are frequent, but the climate is on the whole very healthy. The lower course of the Elbe forms the southern boundary of Holstein for 65 miles, but the only river of importance within the province is the Eider, which rises in Holstein, and after a course of 120 miles falls into the North Sea, forming an estuary 3 to 12 miles in breadth. It is navigable from its mouth as far as Rendsburg, and the waterway between the two seas is completed by a canal from Rendsburg to Kiel. The new Baltic Canal, which is to be navigable for large vessels, will also intersect Holstein. There are numerous lakes in north-east Holstein, the largest of which are the Plöner See (12 square miles) and the Selenter See (9 square miles).

Of the total area of the province 53 per cent is occupied by tilled land, 28.5 per cent by meadows and pastures, and only 6.4 per cent by forests. The ordinary cereals are all cultivated with success and there is generally a considerable surplus for exportation, rapeseed is grown in the marsh lands and flax on the east coast, while large quantities of apples and other fruit are raised near Altona for the Hamburg and English markets. In 1858 the province contained 156,534 horses, 727,505 cattle, 320,768 sheep, 268,061 pigs, and 42,580 goats. The marsh lands afford admirable pasture, and a greater proportion of cattle (65 per 100 inhabitants) is reared in Schleswig-Holstein, mainly by small owners, than in any other Prussian province. Great numbers of the best cattle of Schleswig are exported to England. The Holstein horses are also in request, but sheep-farming is comparatively neglected. Bee-keeping is found a productive industry, and in 1859 the province possessed 113,896 hives. The hills skirting the bays of the Baltic coast are generally pleasantly wooded, but the forests are nowhere of great extent except in the duchy of Lauenburg. The fishing in the Baltic is productive, Eckernförde is the chief fishing station in Prussia. The oysters from the beds on the west coast of Schleswig are well known under the misnomer of "Holstein natives." The mineral resources of the province are almost confined to a few layers of rock-salt near Segeberg. The manufacturing industry is also insignificant and does not extend much beyond the large towns, such as Altona, Kiel, and Flensburg. The shipbuilding of Kiel and other seaports is, however, important, and lace is made by the peasants of North Schleswig. The commerce and shipping of Schleswig-Holstein, stimulated by its position between two seas, as well as by its excellent harbours and waterways, are much more prominent than its manufactures. Kiel is the chief seaport of Prussia, while an overseas trade is also carried on by Altona and Flensburg. The main exports are grain, cattle, horses, fish, and oysters, in return for which come lumber, coal, salt, wine, and

celand produce. The trading fleet of Schleswig-Holstein in 1854 consisted of 715 vessels, 142 steamers, with a total tonnage of 115,000 tons, more than half the ships belonged to the North Sea coast, but 90 per cent of the steamers and 65 per cent of the tonnage must be credited to the Brites.

The population of the province in 1880 was 1,127,119, comprising 1,111,953 Protestants, 8903 Roman Catholics, and 5322 Jews. The urban and rural communities are in the proportion of 4 to 6. About 98 per cent of the population are supported by agriculture, 26 per cent by manufacturing industry, 10 per cent by trade, while 12 per cent are domestic servants and day-labourers, 6 per cent is absorbed by the official and professional classes, and 5 per cent by those who receive no occupation. The great bulk of the Holsteiners and more than half the Schleswigers are of genuine German stock, but there are about 150,000 Danes in the north part of Schleswig. Among the Germans the prevalent tongue is Low German, but the North Frisians on the west coast of Schleswig and the North Sea islands (about 30,000 in all) still speak a Frisian dialect, which, however, is gradually dying out. The peninsula of Angeln, between the Gulf of Flensburg and the Schlei, is supposed to have been the original seat of the English, and most observers profess to see a striking resemblance between this district and the counties of Kent and Surrey. The peasants of Dithmarschen also retain many of their ancient peculiarities. The boundary between the Danish and German languages is approximately a line between Flensburg and Tondern, not more than 15 per cent of the entire population of the province speak Danish as their mother-tongue. The chief educational institution in Schleswig-Holstein is the university of Kiel, and the prevalence of the ordinary school system is proved by the fact that in 1853-54 the Schleswig-Holstein recruits showed a smaller proportion of illiteracy (0.11 per cent) than those from any other part of the German empire. Schleswig is the official capital of the province, but Altona and Kiel are the largest towns, the former being also the headquarters of an army corps and the latter the chief naval station of Germany. Kiel and Flensburg are fortified, and the old lines of Düppel are also maintained. The province sends ten members to the reichstag and nineteen to the Prussian house of deputies. The provincial estates meet in Rendsburg.

History.—The history of the southern part of the Cimbric peninsula is the record of a struggle between the Danes and the Germans, ending in the meantime in favour of the latter. The earliest inhabitants of whose existence we have any trace seem to have been of German stock, and German in their language, but that it was the emigration to England of the Jutes and Angles that first gave the Scandinavian or Danish element scope to develop in the district. In the early part of the ninth century we find Charlemagne in conflict with the Danish rulers of South Jutland or Schleswig* and establishing a "Danish mark" between the Eider and the Schlei. Some attempt to introduce Christianity was also made at this time by Bishop Ansgarus, but it was not till the middle of the following century that the new creed found anything approaching to general acceptance. In 1027 the Danish king Knud (the English Canute) obtained from Conrad the recognition of Schleswig's independence of the empire, and henceforth the Eider became the recognised boundary between Germany and Denmark ("Eidura Romani terminus imperii"). Schleswig, though a Danish province, was not merged in the other possessions of Denmark, but enjoyed a separate and hereditary government under the rule of viceroys or dukes chosen from the younger sons of the royal house. One of the most vigorous of these rulers was Knud Laward (1115-1181), who extended his sway over the Wendish district of Wagna (see below) and held it as a fief of the German empire. He was thus the first ruler of Schleswig to hold that singular double relationship to the king of Denmark and the German empire which afterwards became so important a factor in the history of the country. Valdemar I. and Knud, became king of Denmark and Knud's grandson, King Valdemar II., conferred the duchy of South Jutland or Schleswig on his son Abel in 1222. The terms of this investment afterwards became a fertile subject of dispute between the dukes and the crown, the former maintaining that they held their land as an hereditary and inalienable fief, while the kings argued that the fief was revocable at pleasure. The dukes, however, assisted by their kinsmen, the counts of Holsten, and finally establishing their position, and finally remained in undisputed possession of their duchy. In 1326 Duke Valdemar V. of Schleswig was raised to the throne of Denmark through the influence of his uncle, Count Gerhard of Holsten, to whom in return he ceded his duchy. Valdemar had to abdicate in 1380 and recovered his duchy back again, granting, however, the "Constitutio Valde-marica," which ensured the rights of eventual succession in Schleswig to the Holsten count. The compact came to fruition in 1375, when the male dual line became extinct, and Margaret of Denmark formally recognized the union of the two territories in 1386. Henceforth we have the same prince ruling over Schleswig and

Holsten, holding the first as a fief of the Danish crown and the other as a fief of the German empire.

The history of Holsten before its union with Schleswig has been partly indicated in the foregoing paragraph. Nordalunga, or the land to the north of the Elbe, was inhabited by the Saxons, under whom it was divided into four *gaues* or hundreds.—DITHMARSCHEN, or, on the west, the district of Holstein ("man of the forest") in the middle, Wagna on the east, and Stormarn on the south. The Nordalungians were the last of the Saxons to be subdued by Charlemagne (804), who gave Wagna to his Wendish allies the Obotrites, and established a Wendish mark on their frontier at the same time that he established a Danish mark on the Eider. The other three gaues were incorporated with the duchy of Saxony, Dithmarschen being included in the county of Stade while Holsten and Stormarn had counts of their own. In 1110 the countship of Holsten was conferred upon Adolphus I. of Schauenburg, who founded the influential line that eventually ruled over Schleswig-Holstein. Wagna was added to Holsten by Adolphus II. about 1140. In the beginning of the 18th century the Danish kings extended their sway over all German territory to the north of the Elbe, and their conquests were confirmed by an imperial grant in 1214. The dual state of affairs, however, was of no long continuance, and Adolphus III. of Holsten succeeded in re-establishing his independence in 1225. The Holsten family now became split up into several branch-lines, of which that of Rendsburg proved the most lasting and important. A daughter of this line married Duke Abel of Schleswig, and the Holsten counts lent faithful aid to their kinsmen in resisting the encroachments and claims of the kings of Denmark. In the district state of Denmark at the beginning of the 14th century Count Gerhard of Holsten became the practical ruler of the kingdom, but preferred to place the crown on the head of his nephew Valdemar. Legally speaking, Holsten remained a mediate fief of Saxony, but with the decline of the Saxon duchy this relationship became obscured, and, when the Holsten lands were created a duchy in 1474, the new duke held his lands directly from the emperor.

In 1448 the royal line of Denmark became extinct, and the crown was offered to Adolphus VII. of Schleswig-Holstein, who refused it for himself but exerted his influence to secure it for his nephew Christian of Oldenburg. Adolphus died in 1469, leaving no sons. Christian was the legal heir of Schleswig, but his claims to Holsten were by no means so strong. The estates of Schleswig-Holstein, however, decided in his favour on the plea that the line of Schleswig-Holstein should be separate and hereditary, and the confirmation of this indissoluble connexion. It was also formally stipulated that the duchies should never be actually incorporated with the kingdom of Denmark, while the hereditary nature of the fief was given up and the estates acquired the right to choose as their duke any one of Christian's descendants. This Succession Act was the basis of the union of the two duchies for the next four hundred years, and the practical contradiction between their own inseparable connexion and their feudal duty to different sovereigns at once the cause and the explanation of the complicated "Schleswig-Holsten question."

Now follows a series of endless shiftings, divisions, and reunions of the two duchies. After 1580 the various collateral lines of the Oldenburg family thus formed are represented by two main branches,—the royal or Göttingstad line and the Götting or dual line. The possession of Schleswig-Holstein, though the subject of no regard was paid to the boundary of the Eider, each of them ruled over detached parts of both duchies, though the whole of Schleswig was still under the sovereignty of Denmark and the whole of Holsten under that of Germany. Practically Schleswig came to be regarded merely as a part of Denmark, while Holsten's connexion with Germany preserved for it a flicker of independence. In 1680 Denmark became an absolute monarchy, and the principle of female succession was acknowledged, and in 1699 the right of inheritance was confined to the male line, the policy of Denmark was vigorously directed towards doing away as far as possible with all separate rights in the duchy and to getting the Götting or dual portions into the possession of the crown. This policy was naturally more successful in Schleswig than in Holsten, and in 1721 Frederick IV. was able to gain the guarantee of the powers for the incorporation of the whole of Schleswig with the Danish monarchy. He had, however, to give up his claim to Holsten. In 1762 the Holsten-Götting line succeeded to the throne of Russia in the person of Peter III., and this led in 1773 to an agreement by which the Götting line resigned its share of Holsten to the king of Denmark in exchange for Oldenburg and Delmenhorst. The whole of Schleswig-Holstein thus came once more under the sway of a ruler who was at the same time king of Denmark.

The period from 1773 to 1848 was one of peace for the duchies, with considerable progress in material prosperity. The fall of the

* The name of Schleswig did not come into general use for this part of the Cimbric peninsula until the end of the 14th century.

* Thus use of the term "duchies" anticipates a little, as Holstein was not made a duchy till 1474. Dithmarschen, indeed, which was supposed to be a part of dual Holstein, was not subdued till 1659.

German empire in 1806 released Holstein for a time from any connexion with a power outside of Denmark, but in 1815 the Danish monarch had to enter the German Confederation for Holstein and for the recently acquired duchy of LUTENBURG (q.v.). A strong feeling of German patriotism gradually arose in Holstein, affecting part of Schleswig also, and dissatisfaction with the delay of the Danish crown in recognizing the constitutional rights of the duchies led to the events forming the recent history of Schleswig-Holstein. These will be found described with some detail in the articles DENMARK (vol. vii pp. 83, 89) and GERMANY (vol. x pp. 507, 509-512). (J F M)

SCHLETTSTADT, a small town in Lower Alsace, stands on the Ill, 26 miles to the south of Strasburg. It possesses two fine churches, relics of a period of former importance, and carries on manufactures of wire gauze, and a considerable trade in country produce. The population in 1880 was 8979 (7755 Roman Catholics), showing a slight decrease since it has passed into German hands.

Schlettstadt is a place of very early origin, and became a free town of the empire in the 15th century. In the 15th century it was the seat of a celebrated academy, founded by Agricola, which contributed not a little to the revival of learning in this part of Germany. Erasmus of Rotterdam was one of its students. In 1634 the town came into the possession of France, and it was afterwards fortified by Vauban. It offered little resistance, however, to the Germans in 1870, and the fortifications have been razed.

SCHLOZER, AUGUST LUDWIG VON (1735-1809), German historian, was born at Gggstedt, in the county of Hohenlohe-Kirchberg, on the 5th July 1735. Having studied at the universities of Wittenberg and Göttingen, he went in 1755 as a tutor to Stockholm, and afterwards to Upsala, and while in Sweden he wrote in the Swedish language an *Essay on the History of Trade* (1758). In 1759 he returned to Göttingen, where he began the study of medicine. Afterwards he went to St Petersburg with Müller, the Russian historiographer, as Müller's literary assistant and as tutor in his family. Here Schlozer learned the Russian language and devoted himself to the study of Russian history, and in 1762 he was made an adjunct of the Academy and a teacher at the Rasumovsk educational institute. A quarrel with Müller placed him in a position of some difficulty, from which he was happily delivered by a call to a professorship at the university of Göttingen. He began his career at Göttingen in 1767, and soon ranked among the foremost historical writers of his day. His most important works were his *Allgemeine nordische Geschichte* (1772) and his translation of the Russian chronicler Nestor to the year 980 (1802-9). He awoke much intelligent interest in universal history by his *Weltgeschichte im Auszuge und Zusammenhange* (1792-1801), and in several works he helped to lay the foundations of statistical science. He also produced a strong impression by his political writings, the *Briefwechsel* (10 vols., 1776-82) and the *Staatsmengen* (18 vols., 1782-93). In 1804 he was ennobled by the emperor of Russia. He withdrew from active life in 1805, and died on the 9th September 1809.

See *Fernelo, August Ludwig Schlozer* (1875), and *Wissenand, Die Begründung der neuen deutschen Geschichtschreibung durch Götter und Schlozer* (1876). Schlozer's daughter, Dorothea, born on the 10th August, 1770, was one of the most learned women of her time, and received in 1787 the degree of doctor. She was recognized as an authority on several subjects, especially on Russian courage. After her marriage with Rodde, the burgomaster of Lübeck, she devoted herself to domestic duties. She died on the 12th July 1826. Schlozer's son, Christian (born 1774, died 1831) was a professor at Bonn, and published *Anfangsgründe der Staatswirtschaft* (1804-6) and his father's *Öffentliches und Privat-Leben aus Originalurkunden* (1828).

SCHMALKALDEN, a town of Prussia, in the province of Hesse-Nassau, lies about 30 miles to the south-west of Erfurt, and in 1885 contained 6788 inhabitants, chiefly employed in the manufacture of hardware articles. It still possesses the inn in which the important Protestant League of Schmalkalden or Smalkald was concluded

in 1531, and also the house in which the articles were drawn up in 1537 by Luther, Melancthon, and other Reformers. See GERMANY, vol. x p. 498, and LUTHER, vol. xv p. 83.

SCHNEIDEMUHL (Polish *Żyła*), a small town of Prussia, in the province of Posen, lies on the Cuddow, 45 miles north of Posen and 140 miles east by north of Berlin. It is a railway junction of some importance, carries on a trade in wood, grain, and potatoes, and possesses an iron foundry, several glass works and machine-shops, and other industrial establishments. In 1885 the population was 12,259, of whom 7700 were Protestants and about 1000 Poles.

SCHNORR VON KAROLSFELD, JULIUS (1794-1873), of a family of artists, was born in 1794 at Leipsic, where he received his earliest instruction from his father, a draughtsman, engraver, and painter. At seventeen he entered the Academy of Vienna, from which Overbeck and others of the new school who rebelled against the old conventional style had been expelled about a year before. In 1818 he followed the founders of the new school of German pre-Raphaelites in the general pilgrimage to Rome. This school of religious and romantic art abjured modern styles with three centuries of decadence, and reverted to and revived the principles and practice of earlier periods. At the outset an effort was made to recover fresco painting and "monumental art," and Schnorr soon found opportunity of proving his powers, when commissioned to decorate with frescos, illustrative of Ariosto, the entrance hall of the Villa Massimo, near the Lateran. His fellow-labourers were Cornelius, Overbeck, and Veit. His second period dates from 1825, when he left Rome, settled in Munich, entered the service of King Louis, and transplanted to Germany the art of wall-painting learnt in Italy. He showed himself qualified as a sort of poet-painter to the Bavarian court, he organized a staff of trained executants, and set about clothing five halls in the new palace with frescos illustrative of the *Nibelungenlied*. Other apartments his prolific pencil decorated with scenes from the histories of Charlemagne, Frederick Barbarossa, and Rudolph of Hapsburg. These vast and interminable compositions display the master's merits and defects: they are creative, learned in composition, masterly in drawing, but exaggerated in thought and extravagant in style. Schnorr's third period is marked by his "Bible Pictures" or Scripture History in 180 designs. The artist was a Lutheran, and took a broad and unsectarian view which won for his Pictorial Bible ready currency throughout Christendom. The merits are unequal frequently the compositions are crowded and confused, wanting in harmony of line and symmetry in the masses, thus they suffer under comparison with Raphael's Bible. Chronologically speaking, the style is severed from the simplicity and severity of early times, and surrendered to the florid redundancy of the later Renaissance. Yet throughout are displayed fertility of invention, academic knowledge with facile execution, and modern art has produced nothing better than Joseph Interpreting Pharaoh's Dream, the Meeting of Rebecca and Isaac, and the Return of the Prodigal Son. The completion of the arduous work was celebrated in 1862 by the artists of Saxony with a festival, and other German states offered congratulations and presented gifts.

Biblical drawings and cartoons for frescos formed a natural prelude to designs for church windows. The painter's renown in Germany secured commissions in Great Britain. Schnorr made designs, carried out in the royal factory, Munich, for windows in Glasgow cathedral and in St Paul's cathedral, London. This Munich glass provoked controversy, medievalists objected to its want

of lustre, and stigmatized the windows, as coloured blinds and picture transparencies. But the opposing party claimed for these modern revivals "the union of the severe and excellent drawing of early Florentine oil-paintings with the colouring and arrangement of the glass-paintings of the latter half of the 16th century." Schnorr's busy life closed at Munich in 1872.

SCHOLASTICISM is the name usually employed to denote the most typical products of mediæval thought. The final disappearance of ancient philosophy may be dated about the beginning of the 6th century of our era. Boetius, its last representative in the West, died in 525, and four years later the Athenian schools were closed by order of the emperor Justinian. Before this time Christian thought had already been active in the fathers of the church, but their activity had been entirely devoted to the elaborating and systematizing of theological dogmas. Although the dogmas unquestionably involve philosophical assumptions, the fathers deal with them throughout simply as churchmen, and do not profess to supply for them a philosophical or rational basis. Only incidentally do some of them—like Augustine, for example—digress into strictly philosophical discussion. After the centuries of intellectual darkness during which the settlement of the new races and their conversion to Christianity proceeded and the foundations of the modern European order were being laid, the first symptoms of renewed intellectual activity appear contemporaneously with the consolidation of the empire of the West in the hands of Charlemagne. That enlightened monarch endeavoured to attract to his court the best scholars of Britain and Ireland (where the classical tradition had never died out), and by imperial decree (787) commanded the establishment of schools in connexion with every abbey in his realms. Peter of Pisa and Alcuin of York were his advisers in directing this great work, and under their fostering care the opposition long supposed to exist between godliness and secular learning speedily disappeared. Besides the celebrated school of the Palace, where Alcuin had among his hearers the members of the imperial family and the dignitaries of the empire as well as talented youths of humbler origin, we hear of the episcopal schools of Lyons, Orleans, and St Denis, the cloister schools of St Martin of Tours, of Fulda, Corbie, Fontenelle, and many others, besides the older monasteries of St Gall and Reichenau. These schools became the centres of mediæval learning and speculation, and from them the name Scholasticism is derived. They were designed to communicate instruction in the seven liberal arts which constituted the educational curriculum of the Middle Ages—grammar, dialectic, and rhetoric forming the trivium of arts proper, while geometry, arithmetic, astronomy, and music constituted the quadrivium of the sciences. The name *doctor scholasticus* was applied originally to any teacher in such an ecclesiastical gymnasium, but, as the study of dialectic or logic soon became the object of absorbing interest to the best intellects of the time, it tended to overshadow the more elementary disciplines, and the general acceptance of "doctor" came to be one who occupied himself with the teaching of logic and the discussion of the philosophical questions arising therefrom. The philosophy of the later Scholastics is more extended in its scope, but to the very end of the mediæval period philosophy centres in the discussion of the same logical problems which began to agitate the teachers of the 9th and 10th centuries.

Scholasticism in the widest sense thus extends from the 9th to the end of the 14th or the beginning of the 15th century—from Erigena to Occam and his followers. The belated Scholastics who lingered beyond the last-mentioned date served only as marks for the obloquy heaped upon

the schools by the men of the new time. But, although every systematic account of Scholasticism finds it necessary to begin with Erigena, that philosopher is of the spiritual kindred of the Neoplatonists and Christian mystics rather than of the typical Scholastic doctors. In a few obscure writings of the 9th century we find the beginnings of discussion upon the logical questions which afterwards proved of such absorbing interest, but these are followed by the intellectual interregnum of the 10th century. The activity of Scholasticism is therefore mainly confined within the limits of the 11th and the 14th centuries. It is clearly divisible (by circumstances to be presently explained) into two well-marked periods,—the first extending to the end of the 12th century and embracing as its chief names Roscellinus, Anselm, William of Champeaux, and Abelard, while the second extended from the beginning of the 13th century to the Renaissance and the general distraction of men's thoughts from the problems and methods of Scholasticism. In this second period the names of Albertus Magnus, Thomas Aquinas, and Duns Scotus represent (in the 13th century and the first years of the 14th century) the culmination of Scholastic thought and its consolidation into system.

It is a remark of Pianti's that there is no such thing as Logic philosophy in the Middle Ages; there are only logic and theology. If pressed literally the remark is hypercritical, for it overlooks two facts,—in the first place that the main objects of theology and philosophy are identical, though the method of treatment is different, and in the second place that logical discussion commonly leads up to metaphysical problems, and that this was pre-eminently the case with the logic of the Schoolmen. But the saying draws attention in a forcible way to the two great influences which shaped mediæval thought—on the one side the traditions of ancient logic, on the other the system of Christian theology. Scholasticism opens with a discussion of certain points in the Aristotelian logic, it speedily begins to apply its logical distinctions to the doctrines of the church, and when it attains its full stature in St Thomas it has, with the exception of certain mysteries, rationalized or Aristotelianized the whole churchly system. Or we might say with equal truth that the philosophy of St Thomas is Aristotle Christianized. It is, moreover, the attitude of the Schoolmen to these two influences that yields the general characteristic of the period. Their attitude throughout is that of interpreters rather than of those conducting an independent investigation. And though they are at the same time the acutest of critics, and offer the most ingenious developments of the original thesis, they never step outside the charmed circle of the system they have inherited. They appear to contemplate the universe of nature and man not at first hand with their own eyes but in the glass of Aristotelian formula. Their chief works are in the shape of commentaries upon the writings of "the philosopher."¹ Their problems and solutions alike spring from the master's dicta—from the need of reconciling these with one another and with the conclusions of Christian theology.

The fact that the channels of thought during the Middle Ages were determined in this way by the external influence and of a twofold tradition is usually expressed by saying that reason in the Middle Age is subject to authority. It has not the free play which characterizes its activity in Greece and in the philosophy of modern times. Its conclusions are predetermined, and the initiative of the individual thinker is almost confined, therefore, to formal details in the treatment of his thesis. From the side of the church this characteristic of the period is expressed in the saying that reason has its proper station as the hand-

¹ The common designation of Aristotle in the Middle Ages.

maid of faith (*ancilla fidei*). But it is only fair to add that this principle of the subordination of the reason wears a different aspect according to the century and writer referred to. In Scotus Erigena, at the beginning of the Scholastic era, there is no such subordination contemplated, because philosophy and theology in his work are in implicit unity. According to his memorable expression, "Confectur unde veram esse philosophiam veram religionem, conversamque veram religionem esse veram philosophiam" (*De Divisione Naturæ*, i, 1). Reason in its own strength and with its own instruments evolves a system of the universe which coincides, according to Erigena, with the teaching of Scripture. For Erigena, therefore, the speculative reason is the supreme authority (as he himself indeed expressly asserts), and in accordance with its results the utterances of Scripture and of the church have not infrequently to be subjected to an allegorical or mystical interpretation. But this is only to say again in so many words that Erigena is more of a Neoplatonist than a Scholastic. In regard to the Scholastics proper, Cousin suggested in respect of this point a threefold chronological division,—at the outset the absolute subordination of philosophy to theology, then the period of their alliance, and finally the beginning of their separation. In other words, we note philosophy gradually extending its claims. Dialectics, to begin with, a merely secular art, and only by degrees as its terms and distinctions applied to the subject-matter of theology. The early results of the application, in the hands of Berengarius and Roscellinus, did not seem favourable to Christian orthodoxy. Hence the strength with which a champion of the faith like Anselm insists on the subordination of reason. To Bernard of Clairvaux and many other conservative churchmen the application of dialectic to the things of faith at all appears as dangerous as it is impious. At a later date, in the systems of the great Schoolmen, the rights of reason are fully established and amply acknowledged. The relation of reason and faith remains, it is true, an external one, and certain doctrines—an increasing number as time goes on—are withdrawn from the sphere of reason. But with these exceptions the two march side by side, they establish by different means the same results. For the conflicts which accompanied the first intrusion of philosophy into the theological domain more profound and cautious thinkers with a far ampler apparatus of knowledge had substituted a harmony. "The constant effort of Scholasticism to be at once philosophy and theology" seemed at last satisfactorily realized. But this harmony proved more apparent than real, for the further progress of Scholastic thought consisted in a withdrawal of doctrine after doctrine from the possibility of rational proof and their relegation to the sphere of faith. Indeed, no sooner was the harmony apparently established by Aquinas than Duns Scotus began this negative criticism, which was carried much farther by William of Ockham. But this is equivalent to a confession that Scholasticism had failed in its task, which was to rationalize the doctrines of the church. The two authorities refused to be reconciled. The Aristotelian firm refused to fit a matter for which it was never intended, the matter of Christian theology refused to be forced into an alien form. The Scholastic philosophy speedily ceased therefore to possess a *raison d'être*, and the spread of the sceptical doctrine of a twofold truth proclaims the destruction of the fabric erected by medieval thought. The end of the period was thus brought about by the internal decay of its method and principles quite as much as by the variety of external causes which contributed to transfer men's interests to other subjects.

But, although the relation of reason to an external Scholastic authority thus constitutes the badge of medieval thought, it would be in the last degree unjust to look upon Scholasticism as philosophically barren, and to speak as if reason, after an interregnum of a thousand years, resumed its rights at the Renaissance. Such language was excusable in the men of the Renaissance, fighting the battle of classic form and beauty and of the many-sidedness of life against the barbarous terminology and the monastic ideals of the schools, or in the protagonists of modern science protesting against the complete absorption of human talent by metaphysics—an absorption never witnessed to the same extent before or since. The new is never just to the old, we do not expect it to be so. It belongs to a later and calmer judgment to recognize how the old contained in itself the germs of the new, and a closer study of history is invariably found to diminish the abruptness of the picturesque new beginnings which furnish forth our current divisions of epochs and periods. In the schools and universities of the Middle Age the intellect of the semi-barbarous European peoples had been trained for the work of the modern world. It had advanced from a childish rudeness to an appreciation of the subtlest logical and metaphysical distinctions. The debt which modern philosophy owes to the Schoolmen for this formal training has been amply acknowledged even by a writer like J. S. Mill. But we may go further and say that, in spite of their initial acceptance of authority, the Scholastics are not the antagonists of reason, on the contrary they fight its battles. As has often been pointed out, the attempt to establish by argument the authority of faith is in reality the unconscious establishment of the authority of reason. Reason, if admitted at all, must ultimately claim the whole man. Anselm's motto, *Credo ut intelligam*, marks well the distance that has been traversed since Tertullian's *Credo quia absurdum est*. The claim of reason has been recognized to manipulate the data of faith, at first blindly and immediately received, and to weld them into a system such as will satisfy its own needs. Scholasticism that has outlived its day may be justly identified with obscurantism, but not so the systems of those who, by their mighty intellectual force alone, once held all the minds of Europe in willing subjection. The scholastic systems, it is true, are not the free products of speculation, in the main they are *summæ theologæ*, or they are modified versions of Aristotle. But each system is a fresh recognition of the rights of reason, and Scholasticism as a whole may be justly regarded as the history of the growth and gradual emancipation of reason which was completed in the movements of the Renaissance and the Reformation. Indeed, the widening of human interests which then took place is not without its prelude in the systems of the second period of Scholasticism. The complementary sciences of theology and philosophy remain, of course, the central and dominating interest; but Albertus Magnus was keenly interested in natural science, and a system like that of Aquinas is as wide as Aristotle's in its range, and holds no part of nature to be outside its inquiries.

In speaking of the origin of Scholasticism—name and "Universalis."—thing—it has been already noted that mediæval speculation takes its rise in certain logical problems. To be more precise, it is the nature of "universals" which forms the central theme of Scholastic debate. This is the case almost exclusively during the first period, and only to a less extent during the second, where it reappears in a somewhat different form as the difficulty concerning the principle of individuation. Otherwise expressed, the question on which centuries of discussion were thus expended concerns the nature of genera and species and their relation to the individual. On this, Nominalists and

¹ Milman's *Latin Christianity*, ix, 101

Realists take opposite side, and, exclusively logical as the point may at first sight seem to be, adherence to one side or the other is an accurate indication of philosophic tendency. The two opposing theories express at bottom, in the phraseology of their own time, the radical divergence of pantheism and individualism—the two extremes between which philosophy seems pendulum-wise to oscillate, and which may be said still to await their perfect reconciliation. First, however, we must examine the form which this question assumed to the first medieval thinkers, and the source from which they derived it. A single sentence in Porphyry's *Isagoge* or "introduction" to the *Categories* of Aristotle furnished the text of the prolonged discussion. The treatise of Porphyry deals with what are commonly called the predicables, i. e., the notions of genus, species, difference, property, and accident; and he mentions, but declines to discuss, the various theories that have been held as to the ontological import of genera and species. In the Latin translation of Boetius, in which alone the *Isagoge* was then known, the sentence runs as follows—"Mox de generibus et speciebus illud quidem sive substantiam, sive in suis nodis intellectibus posita sint, sive substantia corporalia sunt an incorporalia, et utrum separata a sensibilibus an in sensibilibus posita et circa hæc consistentia, dicere recusabo, altissimum enim negotium est huiusmodi et majoris egens inquisitionis." The second of these three questions may be safely set aside, the other two indicate with sufficient clearness three possible positions with regard to universals. It may be held that they exist merely as conceptions in our minds (*in solis nodis intellectibus*), this is Nominalism or Conceptualism. It may be held, in opposition to the Nominalistic view, that they have a substantial existence of their own (*substantia*), independent of their existence in our thoughts. But Realism, as this doctrine is named, may be again of two varieties, according as the substantially existent universals are supposed to exist apart from the sensible phenomena (*separata a sensibilibus*) or only in and with the objects of sense as their essence (*in sensibilibus posita et circa hæc consistentia*). The first form of Realism corresponds to the Platonic theory of the transcendence of the ideas, while the second reproduces the Aristotelian doctrine of the essence as inseparable from the individual thing. But, though he implies an ample previous treatment of the questions by philosophers, Porphyry gives no references to the different systems of which such distinctions are the outcome, nor does he give any hint of his own opinion on the subject, definite enough though that was. He simply sets the discussion aside as too difficult for a preliminary discourse, and not strictly relevant to a purely logical inquiry. Porphyry, the Neoplatonist, the disciple of Plotinus, was an unknown personage to those early students of the *Isagoge*. The passage possessed for them a mysterious charm, largely due to its isolation and to their ignorance of the historic speculations which suggested it. And accordingly it gave rise to the three great doctrines which divided the medieval schools:—Realism of the Platonic type, embodied in the formula *universalia ante rem*; Realism of the Aristotelian type, *universalia in re*; and Nominalism, including Conceptualism, expressed by the phrase *universalia post rem*, and also claiming to be based upon the Peripatetic doctrine.

To form a proper estimate of the first stage of Scholastic discussion it is requisite above all things to have a clear idea of the appliances then at the disposal of the writers. In other words, what was the extent of their knowledge of ancient philosophy? Thanks to the researches of Jourdain and others, it is possible to answer this question with something like precision. To begin with, we know that till the 13th century the Middle Ages was ignorant

of Greek, and possessed no philosophical works in their Greek original, while in translations their stock was limited to the *Categories* and the *De Interpretatione* of Aristotle in the versions of Boetius, and the *Timæus* of Plato in the version of Chalcidius. To this must be added, of course, Boetius's translation of Porphyry's *Isagoge* already referred to. The whole metaphysical, ethical, and physical works of Aristotle were thus unknown, and it was not till the 12th century (after the year 1120) that the *Analytics* and the *Topics* became accessible to the logicians of the time. Some general information as to the Platonic doctrines (chiefly in a Neoplatonic garb) was obtainable from the commentary with which Chalcidius (6th cent.) accompanied his translation, from the work of Apuleius (2d cent.) *De Dogmaticis Platonicis*, and indirectly from the commentary of Macrobius (c. 400) on the *Somnium Scipionis* of Cicero, and from the writings of St Augustine. As aids to the study of logic, the doctors of this period possessed two commentaries by Boetius on the *Isagoge* (*Ad Porphyrium a Victorino translatus* and *In Porphyrium a se translatus*), two commentaries by the same author on the *De Interpretatione* and one on the *Categories*, as well as another, mainly rhetorical, *Ad Ciceronianam Topicam*. To these are to be added the following original treatises of Boetius—*Introductio ad Categoricos Syllogismos*, *De Syllogismo Categorico*, *De Syllogismo Hypothetico*, *De Divisione*, *De Definitione*, and *De Differentiis Topicis*, the last dealing almost exclusively with rhetoric. There were also in circulation two tracts attributed to St Augustine, the first of which, *Præceptorum Dialecticorum*, is probably his, but is mainly grammatical in its import. The other tract, known as *Categoriarum Decem*, and taken at first for a translation of Aristotle's treatise, is really a rapid summary of it, and certainly does not belong to Augustine. To this list there must be added three works of an encyclopedic character, which played a great part as text-books in the schools. Of these the oldest and most important was the *Satyricon* of Marcianus Capella (close of 5th century), a curious medley of prose and allegorical verse, the greater part of which is a treatise on the seven liberal arts, the fourth book dealing with logic. Similar in its contents is the work of Cassiodorus (468–562), *De Artibus ac Disciplinis Liberalium Litterarum*, of which the third work referred to, the *Origines* of Isidore of Seville (ob. 636), is little more than a reproduction. The above constitutes without exception the whole material which the earlier Middle Ages had at its disposal.

The grandly conceived system of Erigena (see ERIGENA Erigena, and MYSTICISM) stands by itself in the 9th century like the product of another age. John the Scot was still acquainted with Greek, seeing that he translated the work of the pseudo-Dionysius, and his speculative genius achieved the fusion of Christian doctrine and Neoplatonic thought in a system of quite remarkable metaphysical completeness. It is the only complete and independent system between the decline of ancient thought and the system of Aquinas in the 13th century, if indeed we ought not to go further, to modern times, to find a parallel. Erigena pronounces no express opinion upon the question which was even then beginning to occupy men's minds, but his Platonico-Christian theory of the Eternal Word as containing in Himself the exemplars of created things is equivalent to the assertion of *universalia ante rem*. His whole system, indeed, is based upon the idea of the divine as the exclusively real, of which the world of individual existence is but the theophany; the special and the individual are immanent, therefore, in the general. And hence at a much later date (in the beginning of the 13th century) his name was invoked to cover the pantheistic heresies of Amalrich of Bena. Erigena

does not separate his Platonic theory of pre-existent exemplars from the Aristotelian doctrine of the universal as in the individuals. As Ueberweg points out, his theory is rather a result of the transference of the Aristotelian conception of substance to the Platonic idea, and of an identification of the relation of accidents to the substance in which they inhere with that of the individuals to the Idea of which, in the Platonic doctrine, they are copies (*Hist. of Philosophy*, 1 363, Eng. trans.) Hence it may be said that the universals are in the individuals, constituting their essential reality (and it is an express part of Erigena's system that the created but creative Word, the second division of Nature, should pass into the third stage of created and non-creating things), or, rather, perhaps, we ought to say that the individuals exist in the bosom of their universal. At all events, while Erigena's Realism is pronounced, the Platonic and Aristotelian forms of the doctrine are not distinguished in his writings. Prantl has professed to find the headstream of Nominalism also in Scotus Erigena, but beyond the fact that he discusses at considerable length the categories of thought and their mutual relations, occasionally using the term "voces" to express his meaning, Prantl appears to adduce no reasons for an assertion which directly contradicts Erigena's most fundamental doctrines. Moreover Erigena again and again declares that dialectic has to do with the studia of a real or divine classification—"Intelligitur quod ars illa, quae dividit genera in species et species in genera resolvit, quae διαλεκτική dicitur, non ab humanis machinationibus sit facta, sed in natura rerum ab auctore omnium artium, quae verae artes sunt, condita et a sapientibus inventa" (*De Divisione Naturae*, iv 4).

The immediate influence of Erigena's system cannot have been great, and his works seem soon to have dropped out of notice in the centuries that followed. The real germs of Realism and Nominalism, as they took shape in medieval thought, are to be found in the 9th century, in scattered commentaries and glosses (mostly still in manuscript) upon the statements of Porphyry and Boetius. Boetius in commenting upon Porphyry had already started the discussion as to the nature of universals. He is definitely anti-Platonic, and his language sometimes takes even a nominalistic tone, as when he declares that the species is nothing more than a thought or conception gathered from the substantial similarity of a number of dissimilar individuals. The expression "substantial similarity" is still, however, sufficiently vague to cover a multitude of views. He concludes that the genera and species exist as universals only in thought, but, inasmuch as they are collected from singulars on account of a real resemblance, they have a certain existence independently of the mind, but not an existence disjoined from the singulars of sense—"Subsistunt ergo circa sensibilia, intelliguntur autem praeter corpora." Or, according to the phrase which recurs so often during the Middle Ages, "universale intelligitur, singulare sentitur." Boetius ends by declining to adjudicate between Plato and Aristotle, remarking in a semi-apologetic style that, if he has expounded Aristotle's opinion by preference, his course is justified by the fact that he is commenting upon an introduction to Aristotle. And, indeed, his discussion cannot claim to be more than semi-popular in character. The point in dispute has not in his hands the all-absorbing importance it afterwards attained, and the keenness of later distinctions is as yet unknown. In this way, however, though the distinctions drawn may still be comparatively vague, there existed in the schools a Peripatetic tradition to set over against the Neoplatonic influence of John the Scot, and amongst the earliest remains of Scholastic thought we find this tradition asserting itself some-

what vigorously. There were Nominalists before Roscellinus among these early thinkers.

Alcuin, the first head of the school of the Palace, does nothing more in his *Dialectica* than abridge Boetius and the other commentators. But in the school of Fulda, presided over by his pupil Hrabanus Maurus (776-856), there are to be found some fresh contributions to the discussion. The collected works of Hrabanus himself contain nothing new, but in some glosses on Aristotle and Porphyry, first exhumed by Cousin, there are several noteworthy expressions of opinion in a Nominalistic sense. The author interprets Boetius's meaning to be "*Quod eadem res individuum et species et genus est, et non esse universalia individua quasi quoddam diversum*." He also cites, apparently with approval, the view of those who held Porphyry's treatise to be not *de quinque rebus*, but *de quinque vocibus*. A genus, they said, is essentially something which is predicated of a subject, but a thing cannot be a predicate (*res enim non praedicatur*). These glosses, it should be added, however, have been attributed by Prantl and Kaulich, on the ground of divergence from doctrines contained in the published works of Hrabanus, to some disciple of his rather than to Hrabanus himself. Fulda had become through the teaching of the latter an intellectual centre. Eric or Heimicus, who studied there under Hamon, the successor of Hrabanus, and afterwards taught at Auxerre, wrote glosses on the margin of his copy of the pseudo-Augustinian *Categoriae*, which have been published by Cousin and Hauréau. He there says in words which recall the language of Locke (*Essay*, iii. 3) that because proper names are innumerable, and no intellect or memory would suffice for the knowing of them, they are all as it were comprehended in the species ("Sciendum autem, quia propria nomina primum sunt innumerabilia, ad quae cognoscenda intellectus nullus seu memoria sufficit, haec ergo omnia coartata species comprehendit, et facit primum gradum.") Taken in their strictness, these words state the position of extreme Nominalism, but even if we were not forbidden to do so by other passages, in which the doctrine of moderate Realism is adopted (under cover of the current distinction between the singular as felt and the pure universal as understood), it would still be unfair to press any passage in the writings of this period. As Cousin says, "Realism and Nominalism were undoubtedly there in germ, but their true principles with their necessary consequences remained profoundly unknown, their connexion with all the great questions of religion and politics was not even suspected. The two systems were nothing more as yet than two different ways of interpreting a phrase of Porphyry, and they remained unnoticed in the obscurity of the schools. . . . It was the 11th century which gave Nominalism to the world."¹

Remi or Remigius of Auxerre, pupil of Eric, became the most celebrated professor of dialectic in the Parisian schools of the 10th century. As he reverted to Realism, his influence, first at Rheims and then in Paris, was doubtless instrumental in bringing about the general acceptance of that doctrine till the advent of Roscellinus as a powerful disturbing influence. "There is one genus more general than the rest," says Remi (*apud Hauréau, De la Philosophie Scolastique*, i 146), "beyond which the intellect cannot rise, called by the Greeks *oúsia*, by the Latins *essentia*. The essence, indeed, comprehends all natures, and everything that exists is a portion of this essence, by participation in which everything that is hath its existence." And similarly with the intermediate genera. "Homo est multorum hominum substantialis unitas." Remigius is thus a Realist, as Hauréau remarks,

Maurus

Rem.

Influence of
Boetius

not so much in the sense of Plato as in the spirit of Parmenides, and Haureau applies to this form of Realism Bayle's description of Realism in general as "le Spinozisme non développé." The 10th century as a whole is especially marked out as a dark age, being partly filled with civil troubles and partly characterized by a reaction of faith against reason. In the monastery of St Gall there was considerable logical activity, but nothing of philosophical interest is recorded. The chief name of the century is that of Gerbert (died as Pope Sylvester II in 1003). He studied at Autillac under Otto of Clugny, the pupil of Remigius, and later among the Moors in Spain, and taught afterwards himself in the schools of Tours, Fleury, Sens, and Rheims. He was a man of universal attainment, but only his treatise *De Rationali et Ratione uti* need be mentioned here. It is more interesting as a display of the logical acquirements of the age than as possessing any direct philosophical bearing. The school of Chartres, founded in 990 by Fulbert, one of Gerbert's pupils, was distinguished for nearly two centuries not so much for its dialectics and philosophy as for its humanistic culture. The account which John of Salisbury gives of it in the first half of the 12th century, under the presidency of Theodoric and Bernard, gives a very pleasant glimpse into the history of the Middle Ages. Since then, says their regretful pupil, "less time and less care have been bestowed on grammar, and persons who profess all arts, liberal and mechanical, are ignorant of the primary art, without which a man proceeds in vain to the rest. For albeit the other studies assist literature, yet this has the sole privilege of making one lettered."¹

Hitherto, if dialectical studies had been sometimes viewed askance by the stricter churchmen it was not because logic had dared to stretch forth its hands towards the ark of God, but simply on the ground of the old opposition between the church and the world. These secular studies absorbed time and ability which might have been employed for the glory of God and the service of the church. But now bolder spirits arose who did not shrink from applying the distinctions of their human wisdom to the mysteries of theology. It was the excitement caused by their attempt, and the heterodox conclusions which were its first result, that lifted these Scholastic disputations into the central position which they henceforth occupied in the life of the Middle Ages. And whereas, up to this time, discussion had been in the main of a purely logical character, the next centuries show that peculiar combination of logic and theology which is the mark of Scholasticism, especially in the period before the 15th century. For reason, having already asserted itself so far, could not simply be put under a ban. Orthodoxy had itself to put on the armour of reason, and so penopled its champions soon proved themselves superior to their antagonists on their own battlefield.

One of the first of these attacks was made by Berengarius of Tours (999-1088) upon the doctrine of transubstantiation, he denied the possibility of a change of substance in the bread and wine without some corresponding change in the accidents. Berengarius had studied at Chartres, where his exclusive devotion to dialectic caused Fulbert more than once to remonstrate with his pupil. According to the testimony of his opponent and former fellow-student, Lanfranc, he seems even in his student days to have been by temperament a rebel against authority. "When we were in the schools together," says Lanfranc, "it was your part always to collect authorities against the Catholic faith." M de

Reuclat characterizes his view on the Eucharist as a specific application of Nominalism ("un nominalisme spécial au re-trait à une seule question"). More intimately connected with the progress of philosophical thought was the tritheistic view of the Trinity propounded by Roscellinus as one of the results of his Nominalistic theory of knowing and being. The sharpness and one-sidedness with which he formulated his position were the immediate occasion of the contemporaneous crystallization of Realism in the theories of Anselm and William of Champeaux. Henceforth discussion is carried on with a full consciousness of the differences involved and the issues at stake, and, thanks to the heretical conclusion disclosed by Roscellinus, Realism became established for several centuries as the orthodox philosophical creed. Roscellinus (*ob* c 1125) was looked upon by later times as the originator of the *sententia vocum*, that is to say, of Nominalism proper. Unfortunately, we are reduced for a knowledge of his position to the scanty and ill-natured notices of his opponents (Anselm and Abelard). From these we gather that he refused to recognize the reality of anything but the individual, he treated "the universal substance," says Anselm, as no more than "flatus vocis," a verbal breathing or sound, and in a similar strain he denied any reality to the parts of which a whole, such as a house, is commonly said to be composed. The parts in the one case, the general name or common attributes in the other, are only, he seems to have argued, so many subjective points of view from which we choose to regard that which in its own essence is one and indivisible, existing in its own right apart from any connexion with other individuals. This pure individualism, consistently interpreted, involves the denial of all real relation whatsoever; for things are related and classified by means of their general characteristics. Accordingly, if these general characteristics do not possess reality, things are reduced to a number of characterless and mutually indifferent points. It is possible, as Haureau maintains, that Roscellinus meant no more than to refute the untenable Realism which asserts the substantial and, above all, the independent existence of the universals. Some of the expressions used by Anselm in controverting his position favour this idea, since they prove that the Realism of Anselm himself embraced positions discarded by the wiser advocates of that doctrine. Anselm upbraids Roscellinus, for example, because he was unable to conceive whiteness apart from its existence in something white. But this is precisely an instance of the hypostatization of abstractions in exposing which the chief strength and value of Nominalism lie. Cousin is correct in pointing out, from the Realistic point of view, that it is one thing to deny the hypostatization of an accident like colour or wisdom, and another thing to deny the foundation in reality of those "true and legitimate universals" which we understand by the terms genera and species. "The human race is not a word, or, if it is, we are driven to assert that there is really nothing common and identical in all men—that the brotherhood and equality of the human family are pure abstractions, and that, since individuality is the sole reality, the sole reality is difference, that is to say, hostility and war, with no right but might, no duty but interest, and no remedy but despotism. These are the sad but necessary consequences which logic and history impose upon Nominalism and Empiricism."² It is not for a moment to be supposed that the full scope of his doctrine was present to the mind of Roscellinus, but Nominalism would hardly have made the sensation it did had its assertions been as innocent as Haureau would make them. Like most innovators, Roscellinus had his posi-

Application of logic to theology

Berengarius

tion in bold language, which emphasized his opposition to accepted doctrines, and his words, if not his intentions, involved the extreme Nominalism which, by making universality merely subjective, pulverizes existence into detached particulars. And, though we may acquit Roscellinus of consciously propounding a theory so subversive of all knowledge, his criticism of the doctrine of the Trinity is proof at least of the determination with which he was prepared to carry out his individualism. If we are not prepared to say that the three Persons are one thing—in which case the Father and the Holy Ghost must have been incarnate along with the Son—then, did usage permit, he says, we ought to speak of three Gods.

Anselm

It was this theological deduction from his doctrine that drew upon Roscellinus the polemic of his most celebrated opponent, Anselm of Canterbury (1033-1109). Roscellinus appears at first to have imagined that his tritheistic theory had the sanction of Lanfranc and Anselm, and the latter was led in consequence to compose his treatise *De Fide Triunitatis*. From this may be gathered, in a somewhat inductive and incidental fashion, his views on the nature of universals. "How shall he who has not arrived at understanding how several men are in species one man comprehend how in that most mysterious nature several persons, each of which is perfect God, are one God?" The manner in which humanity exists in the individual was soon to be the subject of keen discussion, and to bring to light diverging views within the Realistic camp, but St. Anselm does not go into detail on this point, and seems to imply that it is not surrounded by special difficulties. In truth, his Realism, as has just been seen, was of a somewhat unorthodox type. It was simply accepted by him in a broad way as the orthodox philosophic doctrine, and the doctrine which, as a sagacious churchman, he perceived to be most in harmony with Christian theology. But Anselm's heart was not in the dialectical subtleties which now began more and more to engross the schools. The only logical treatise which he wrote, *De Grammatica*, falls so far below the height of his reputation that it leads Prantl into undue depreciation of Anselm's eminence as a thinker. Anselm's natural element was theology, and the high metaphysical questions which are as it were the obverse of theology. Hauréau calls him with truth "the last of the fathers", the sweep of his thought recalls St. Augustine rather than the men of his own time. On the other hand, as the first to formulate the ontological argument for the existence of God, he joins hands with some of the profoundest names in modern philosophy. This celebrated argument, which fascinated in turn Descartes, Leibnitz, and Hegel, not to mention other names, appears for the first time in the pages of Anselm's *Proslogium*. To Anselm specially belongs the motto *Crede ut intelligam*, or, as it is otherwise expressed in the sub-title of his *Proslogium*, *Fides quaerens intellectum*. "His method," says Cousin (p. ci.), "is to set out from the sacred dogmas as they are given by the hand of authority, and without at any time departing from these dogmas to impregnate them by profound reflexion, and thus as it were raise the darkness visible of faith to the pure light of philosophy." In this spirit he endeavoured to give a philosophical demonstration not only of the existence of God but also of the Trinity and the Incarnation, which were placed by the later Scholastics among the "mysteries." The Christological theory of satisfaction expounded in the *Cur Deus Homo* falls beyond the scope of the present article. But the Platonically conceived proof of the being of God contained in the *Monologium* shows that Anselm's doctrine of the universals as substances in things (*universalia in re*) was closely connected in his mind with the thought of the *universalia ante rem*, the exemplars of

perfect goodness and truth and justice, by participation in which all earthly things are judged to possess these qualities. In this way he rises like Plato to the absolute Goodness, Justice, and Truth, and then proceeds in Neoplatonic fashion to a deduction of the Trinity as involved in the idea of the divine Word.

Besides its connexion with the speculations of Anselm, the doctrine of Roscellinus was also of decisive influence within the school in crystallizing the opposite opinion. William of Champeaux is reputed the founder of a definitely formulated Realism, much as Roscellinus is regarded as the founder of Nominalism. William of Champeaux (1070-1121) was instructed by Roscellinus himself in dialectic. His own activity as a teacher belongs to the first years of the 12th century. He lectured in Paris in the cathedral school of Notre Dame till the year 1103, when he retired to the priory of St. Victor on the outskirts of Paris. But soon afterwards, unable to resist the importunities of his friends and pupils, he resumed his lectures there, continuing them till his removal to the see of Châlons in 1113, and thus laying the foundation of the reputation which the monastery soon acquired. Unfortunately none of the philosophical works of William have survived, and we are forced to depend for an account of his doctrine upon the statements of his opponent Abelard, in the *Historia Calamitatum Nostrearum*, and in certain manuscripts discovered by Cousin. From these sources it appears that William professed successively two opinions on the nature of the universals, having been dislodged from his first position by the criticism of Abelard, his quondam pupil. There is no obscurity about William's first position. It is a Realism of the most uncompromising type, which by its reduction of individuals to accidents of one identical substance seems to tremble on the very verge of Spinozism. He taught, says Abelard, that the same thing or substance was present in its entirety and essence in each individual, and that individuals differed no whit in their essence but only in the variety of their accidents. "Erst autem in essentia dea communicante universalium, ut eandem essentialem rem totam simul singulis suis inesse adstruere individuum, quoniam quidem nulla esset in essentia diversitas, sed sola multitudo accidentium varietas." Thus "Socratas" is merely an accident of the substance "humanitas," or, as it is put by the author of the treatise *De Generibus et Speciebus*,¹ "Man is a species, a thing essentially one (*res una essentialiter*), which receives certain forms which make it Socrates. This thing, remaining essentially the same, receives in the same way other forms which constitute Plato and the other individuals of the species man; and, with the exception of those forms which mould that matter into the individual Socrates, there is nothing in Socrates that is not the same at the same time under the forms of Plato. . . . According to these men, even though rationality did not exist in any individual, its existence in nature would still remain intact" (Cousin, *Introduction*, &c., p. cxx). Robert Pullen expresses the same point of view concisely when he makes the Realist say, "Species una est substantia, ejus vero individua multae personae, et hae multae personae sunt illa una substantia." But the difficulties in the way of treating the universal as substance or thing are so insuperable, and at the same time so obvious, that criticism was speedily at work upon William of Champeaux's position. He had said expressly that the universal essence, by the addition

William of Champeaux

¹ This treatise, first published by Cousin in his *Ouvrages inédits d'Abélard*, was attributed by him to Abelard, and he was followed in this opinion by Hauréau, but Prantl adduces reasons which seem satisfactory for believing it to be the work of an unknown writer of somewhat later date (see Prantl, *Geschichte d. Logik*, ii. 143).

of the individual forms, was individualized and present *seorsim tota sua gradualitate* in each individual. But if *homo* is wholly and essentially present in Socrates, then it is, as it were, absorbed in Socrates, where Socrates is not; it cannot be, consequently not in Plato and the other *individui hominis*. This was called the argument of the *homo Socrates*, and it appears to have been with the view of obviating such time and space difficulties, emphasized in the criticism of Abelard, that William latterly modified his form of expression. But his second position is enveloped in considerable obscurity. Abelard says, "Sic autem corrent sententiam, ut deinceps rem eandem non essentialiter sed individualiter diceret." In other words, he merely sought to avoid the awkward consequences of his own doctrine by substituting "individualiter" for "essentialiter" in his definition. If we are to put a sense upon this new expression, William may probably have meant to recall any words of his which seemed, by locating the universal in the entirety of its essence in each individual to confer upon the individual an independence which did not belong to it—thus leading in the end to the demand for a separate universal for each individual. In opposition to this Nominalistic view, which implied the reversal of his whole position, William may have meant to say that, instead of the universal being multiplied, it is rather the individuals which are reduced to unity in the universal. The species is essentially one, but it takes on individual varieties or accidents. If, however, we are more ill-natured, we may regard the phrase, with Prantl, as simply a meaningless makeshift in extremities; and if so, Abelard's account of the subsequent decline of William's reputation would be explained. But there is in some of the manuscripts the various reading of "indifferentier" for "individualiter," and this is accepted as giving the true sense of the passage by Cousin and Rémusat (Hauréau and Prantl taking on different grounds, the opposite view). According to this reading, William sought to rectify his position by asserting, not the numerical identity of the universal in each individual, but rather its sameness in the sense of indistinguishable similarity. Ueberweg cites a passage from his theological works which apparently bears out this view, for William there expressly distinguishes the two senses of the word "same." Peter and Paul, he says, are the same in so far as they are both men, although the humanity of each is, strictly speaking, not identical but similar. In the Persons of the Trinity, on the other hand, the relation is one of absolute identity.

Whether this view is to be traced to William or not, it is certain that the theory of "indifference" or "non-difference" (*indifferentia*) was a favourite solution in the Realistic schools soon after his time. The inherent difficulties of Realism, brought to light by the explicit statement of the doctrine and by the criticism of Abelard, led to a variety of attempts to reach a more satisfactory formula. John of Salisbury, in his account of the controversies of these days (*Metalogicus*, II. 17) reckons up nine different views which were held on the question of the universals, and the list is extended by Prantl (II. 118) to thirteen. In this list are included of course all shades of opinion, from extreme Nominalism to extreme Realism. The doctrine of indifference as it appears in later writers certainly tends, as Prantl points out, towards Nominalism, inasmuch as it gives up the substantiality of the universals. The universal consists of the non-different elements or attributes in the separate individuals, which alone exist substantially. If we restrict attention to these non-different elements, the individual becomes for us the species, the genus, &c.; everything depends on the point of view from which we regard it. "Nihil omnino est traser

individuum, sed et aliud aliter et aliter attentum species et genus et generalissimum est." A. Dard of Bath (whose treatise *De Eodem et Diverso* must have been written between 1105 and 1117) was probably the author or at all events the elaborator of this doctrine, and he sought by its means to effect a reconciliation between Plato and Aristotle. "Since that which we see is at once genus and species and individual, Aristotle rightly insisted that the universals do not exist except in the things, of sense. But, since those universals, so far as they are called genera and species, cannot be perceived by any one in their purity without the admixture of imagination, Plato maintained that they existed and could be beheld beyond the things of sense, to wit, in the divine mind. Thus these men, although in words they seem opposed, yet held in reality the same opinion." Prantl distinguishes from the system of indifference the "status" doctrine attributed by John of Salisbury to Walter of Mortagne (c. 1174), according to which the universal is essentially united to the individual, which may be looked upon, e.g., as Plato, man, animal, &c., according to the "status" or point of view which we assume. But this seems only a different expression for the same position, and the same may doubtless be said of the theory which employed the outlandish word "maneries" (*Fr. maniere*) to signify that genera and species represented the different ways in which individuals might be regarded. The concessions to Nominalism which such views embody make them representative of what Hauréau calls "the Peripatetic section of the Realistic school."

Somewhat apart from current controversies stood the teaching of the school of Chartres, humanistically nourished on the study of the ancients. Bernard of Chartres (c. Bernard 1167), called by John of Salisbury "perfectissimus inter Platonicos seculi nostri," taught at Chartres in the beginning of the 12th century, when William was still lecturing at St Victor. He endeavoured, according to John of Salisbury, to reconcile Plato and Aristotle, but his doctrine is almost wholly derived from the former through St Augustine and the commentary of Chalcidius. The *universalia in re* have little place in his thoughts, which are directed by preference to the eternal exemplars as they exist in the supersensible world of the divine thought. His *Megacosmus* and *Microcosmus* are little more than a poetic gloss upon the *Timæus*. William of Conches, a pupil of Bernard's, was more eclectic in his views, and, devoting himself to psychological and physiological questions, was of less importance for the specific logico-metaphysical problem. But Gilbert de la Porrée (Gilbertus Gilbert Porretanus, or, from his birthplace, Pontiers, also called la Pictaviensis, 1075–1154), who was also a pupil of Bernard's, and who was afterwards for about twenty years chancellor of the cathedral of Chartres before he proceeded to lecture in Paris, is called by Hauréau the most eminent logician of the Realistic school in the 12th century and the most profound metaphysician of either school. The views which he expressed in his commentary on the pseudo-Boethian treatise, *De Trinitate*, are certainly much more important than the mediating systems already referred to. The most interesting part of the work is the distinction which Gilbert draws between the manner of existence of genera and species and of substances proper. He distinguishes between the *quod est* and the *quo est*. Genera and species certainly exist, but they do not exist in their own right as substances. What exists as a substance and the basis of qualities or forms (*quod est*) may be said *substante*, the forms on the other hand by which such an individual substance exists qualitatively (*quo est*) *substantum*, though it cannot be said that they *substant*. The intellect collects the universal, which exists but not

as a substance (*est sed non substantia*), from the particular things which not merely are (*sunt*) but also, as subjects of accidents, have substantial existence (*substantia*), by considering only their substantial similarity or conformity. The universals are thus forms inherent in things—"native forms," according to the expression by which Gilbert's doctrine is concisely known. The individual consists of an assemblage of such forms. and it is individual because nowhere else is exactly such an assemblage to be met with. The form exists concretely in the individual things (*sensibilibus in re sensibilibus*), for in sensible things form and matter are always united. But they may be conceived abstractly or non-sensuously by the mind (*sed mente concipitur insensibilibus*), and they then refer themselves as copies to the Ideas their divine exemplars. In God, who is pure form without matter, the archetypes of material things exist as eternal immaterial forms. In this way Gilbert was at once Aristotelian and Platonist. The distinctions made by him above amount to a formal criticism of categories, and in the same spirit he teaches that no one of the categories can be applied in its literal sense to God. Gilbert was also the author of a purely logical work, *De Sex Principiis*, in which he criticized the Aristotelian list of the ten categories, drawing a distinction between the first four—substance, quality, quantity, and relation (*sc.*, according to Gilbert, indeterminate or potential relation)—which he called *formae inherentes*, and the remaining six, which he maintained belong to an object only through its actual relation to other objects (*respectu alterius*). To these six, therefore, he gave the name of *formae assistentes*. This distinction was adopted in all the schools till the 16th century, and the treatise *De Sex Principiis* was bound up with the *Isagoge* and the *Categorías*.

Abelard. But by far the most outstanding figure in the controversies of the first half of the 12th century is Abelard (Petrus Abelardus, also called Palatinus from Pallet, the place of his birth, 1079-1142). Abelard was successively the pupil of Roscelinus and William of Champeaux, and the contrast between their views doubtless emphasized to him at an early period the extravagances of extreme Nominalism and extreme Realism. He speedily acquired a reputation as an unrivalled dialectician, the name Peripateticus being bestowed upon him in later years to signify this eminence. Almost before he had emerged from the pupillary state, he came forward in public as the acute and vehement critic of his masters' doctrines, especially that of William of Champeaux, whom Abelard seems ultimately to have superseded in Paris. About Abelard's own system there is far from being perfect unanimity of opinion, some, like Ritter and Erdmann, regarding it as a moderate form of Realism,—a return indeed to the position of Aristotle,—while others, like Cousin, Rémusat, Hauréau, and Ueberweg, consider it to be essentially Nominalistic, only more prudently and perhaps less consistently expressed than was the case with Roscelinus. His position is ordinarily designated by the name Conceptualism, though there is very little talk of concepts in Abelard's own writings, and Conceptualism, Haerdtel tells us, "*c'est le nominalisme raisonnable*." There can be no doubt, at all events, that Abelard himself intended to strike out a *via media* between the extreme Nominalism of Roscelinus and the views of the ordinary Realists. As against Realism he maintains consistently *Res de re non praedicatur*; genera and species, therefore, which are predicated of the individual subject, cannot be treated as things or substances. This is manifestly true, however real the facts may be which are designated by the generic and specific names; and the position is fully accepted, as has been seen, by a Realist like Gilbert, who perhaps adopted it first from Abelard. Abelard also perceived that Realism, by separ-

ating the universal substance from the forms which individualize it, makes the universal indifferent to these forms, and leads directly to the doctrine of the identity of all beings in one universal substance or matter—a pantheism which might take either an Averroistic or a Spinozistic form. Against the system of non-difference Abelard has a number of logical and traditional arguments to bring, but it is sufficiently condemned by his fundamental doctrine that only the individual exists in its own right. For that system still seems to recognize a generic substance as the core of the individual, whereas, according to Cousin's rendering of Abelard's doctrine, "only individuals exist, and in the individual nothing but the individual." The individual Socrates may be said to be made Socrates by the form *Socratitas*, now "the subject of this form is not humanity in itself but that particular part of human nature which is the nature of Socrates. The matter in the individual Socrates is therefore quite as much individual as his form" (p. clxxv). Holding fast then on the one hand to the individual as the only true substance, and on the other to the traditional definition of the genus as that which is predicated of a number of individuals (*quod praedicatur de pluribus*), Abelard declared that this definition of itself condemns the Realistic theory, only a name, not a thing, can be so predicated,—not the name, however, as a *status vocis* or a collection of letters, but the name as used in discourse, the name as a sign, as having a meaning—in a word, not *vox* but *sermo*. *Sermo est praedicabilis*. By these distinctions Abelard hoped to escape the consequences of extreme Nominalism, from which, as a matter of history, his doctrine has been distinguished under the name of Conceptualism, seeing that it lays stress not on the word as such but on the thought which the word is intended to convey. Moreover, Abelard evidently did not mean to imply that the distinctions of genera and species are of arbitrary or merely human imposition. His favourite expression for the universal is "*quod de pluribus natum est praedicari*" (a translation of Aristotle, *De Interpretatione*, 7), which would seem to point to a real or objective counterpart of the products of our thought, and the traditional definitions of Boetius, whom he frequently quotes, support the same view of the concept as gathered from a number of individuals in virtue of a real resemblance. What Abelard combats is the substantiation of these resembling qualities, which leads to their being regarded as identical in all the separate individuals, and thus paves the way for the gradual undermining of the individual, the only true and indivisible substance. But he modifies his Nominalism so as to approach, though somewhat vaguely, to the position of Aristotle himself. At the same time he has nothing to say against the Platonic theory of *universalia ante rem*, the Ideas being interpreted as exemplars, existing in the divine understanding before the creation of things. Abelard's discussion of the problem (which it is right to say is on the whole incidental rather than systematic) is thus marked by an eclecticism which was perhaps the source at once of its strength and its weakness. Rémusat characterizes his teaching as displaying "rather an originality of talent than of ideas," and Prantl says that in the sphere of logic his activity shows no more independence than that of perhaps a hundred others at the same time. But his brilliant ability and restless activity made him the central figure in the dialectical as in the other discussions of his time. To him was indirectly due, in the main, that troubling of the Realistic waters which resulted in so many modifications of the original thesis, and his own somewhat eclectic ruling on the question in debate came to be tacitly accepted in the schools, as the ardour of the disputants began to abate after the middle of the century.

Bernard
of Clair-
vaux

Abelard's application of dialectic to theology betrayed the Nominalistic basis of his doctrine. He zealously combated the Trithemism of Roscellinus, but his own views on the Trinity were condemned by two councils (at Soissons in 1121 and at Sens in 1140). Of the alternatives—three Gods or *non res*—which his Nominalistic logic presented to Roscellinus, Roscellinus had chosen the first, Abelard recoiled to the other extreme, reducing the three Persons to three aspects or attributes of the Divine Being (Power, Wisdom, and Love). For this he was called to account by Bernard of Clairvaux (1091–1153), the recognized guardian of orthodoxy in France. Bernard declared that he “savoured of Arius when he spoke of the Trinity, of Pelagius when he spoke of grace, and of Nestorius when he spoke of the person of Christ.” “While he laboured to prove Plato a Christian, he showed himself a heathen.” Nor can it be said that the instinct of the saint was altogether at fault. The gems of Rationalism were unquestionably present in several of Abelard's opinions, and still more so, the traditionalists must have thought, in his general attitude towards theological questions. “A doctrine is believed,” he said, “not because God has said it, but because we are convinced by reason that it is so.” “Doubt is the road to inquiry, and by inquiry we perceive the truth” (“*Dubitando enim ad inquisitionem venimus, inquirendo veritatem percipimus*”). The application of dialectic to theology was not new. Anselm had made an elaborate employment of reason in the interest of faith, but the spirit of pious subordination which had marked the demonstrations of Anselm seemed wanting in the arguments of this bolder and more restless spirit, and the church, or at least an influential section of it, took alarm at the encroachments of Rationalism. Abelard's remarkable compilation *Sic et Non* was not calculated to allay their suspicions. In bringing together the conflicting opinions of the fathers on all the chief points of Christian dogmatics, it may be admitted that Abelard's aim was simply to make these contradictions the starting point of an inquiry which should determine in each case the true position and *via media* of Christian theology. Only such a determination could enable the doctrines to be summarily presented as a system of thought. The book was undoubtedly the precursor of the famous *Books of Sentences* of Abelard's own pupil Peter Lombard and others, and of all the *Summae Theologiae* with which the church was presently to abound. But the antinomies, as they appeared in Abelard's treatise, without their solutions, could not but seem to insinuate a deep-laid scepticism with regard to authority. And even the position to apply the unaided reason to solve questions which had divided the fathers must have been resented by the more rigid churchmen as the rash intrusion of an over-confident Rationalism.

Realism was in the beginning of the 12th century the dominant doctrine and the doctrine of the church, the Nominalists were the innovators and the especial representatives of the Rationalistic tendency. In order to see the difference in this respect between the schools we have only to compare the peaceful and fortunate life of William of Champeaux (who enjoyed the friendship of St Bernard) with the agitated and persecuted existence of Roscellinus and, in a somewhat less degree, of Abelard. But now the greater boldness of the dialecticians awakened a spirit of general distrust in the exercise of reason on sacred subjects, and we find even a Realist like Gilbert de la Porrée arraigned by Bernard and his friends before a general council on a charge of heresy (at Rheims, 1148). Though Gilbert was acquitted, the fact of his being brought to trial illustrates the growing spirit of suspicion. Those heresy-hunts show us the worst side of St Bernard,

yet they are in a way just the obverse of his deep mystical piety. This is the judgment of Otto of Freising, a contemporary—“He was, from the favour of his Christian religion, as jealous as, from his habitual meekness, he was in some measure credulous, so that he held in abhorrence those who trusted in the wisdom of this world and were too much attached to human reasonings, and if anything alien from the Christian faith were said to him in reference to them he readily gave ear to it.” The same attitude is maintained by the mystical school of St Victor. Hugo of St Victor (1097–1141) declares that “the uncorrupted truth of things cannot be discovered by reasoning.” The perils of dialectic are manifold, especially in the overbold spirit it engenders. Nevertheless Hugo, by the composition of his *Summa Sententiarum*, endeavoured to give a methodical or rational presentation of the content of faith, and was thus the first of the so-called Summists. Richard of St Victor, prior of the monastery from 1162 to 1173, is still more absorbed in mysticism, and his successor Walter loses his temper altogether in abuse of the dialecticians and the Summists alike. The Summists have as much to say against the existence of God as for it, and the dialecticians, having gone to school to the pagans, have forgotten over Aristotle the way of salvation. Abelard, Peter Lombard, Gilbert de la Porrée, and Peter of Poitiers he calls the “four labyrinths of France.”

This anger and contempt may have been partly justified. Decline by the discreditable state into which the study of logic had fallen. The speculative impulse was exhausted which marks the end of the 11th and the first half of the 12th century,—a period more original and more interesting in many ways than the great age of Scholasticism in the 13th century. By the middle of the century, logical studies had lost to a great extent their real interest and application, and had degenerated into trivial displays of ingenuity. On the other hand, the Summists¹ occupied themselves merely in the systematizing of authorities. The mystics held aloof from both, and devoted themselves to the practical work of preaching and edification. The intellect of the age thus no longer exhibited itself as a unity; disintegration had set in. And it is significant of this that the ablest and most cultured representative of the second half of the century was rather an historian of opinion than himself a philosopher or theologian. John of Salisbury (Johannes John of Salisbury) was educated in France in the years 1136–48—in Paris under Abelard (who had then returned to Paris, and was lecturing at St Genesivère) and Robert of Melm, at Chartres under William of Conches, then again in Paris under Gilbert de la Porrée and Robert Pullen. The autobiographical account of these years contained in his *Metalogicon* is of the utmost value as a picture of the schools of the time, it is also one of the historian's chief sources as a record of the many-coloured logical views of the period. John was a man of affairs, secretary to three successive archbishops of Canterbury, of whom Becket was one. He died in 1180 as bishop of Chartres. When a pupil there, he had imbibed to the full the love of classical learning which was traditional in the school. An ardent admirer of Cicero, he was himself the master of an elegant Latin style, and in his works he often appears

¹ Among these may be mentioned Robert Pullen (ob. 1150), Peter Lombard (ob. 1164), called the *Magister Sententiarum*, whose work became the text-book of the schools, and remained so for centuries. Hundreds of commentaries were written upon it. Peter of Poitiers, the pupil of Peter Lombard, flourished about 1160–70. Other names are Robert of Melm, Hugo of Anagni, Stephen Langton, and William of Auvergne. More important is Alan de Lille (Alanus de Insulis), who died at an advanced age in 1203. His *De Arte seu de Arte Catholica Fides* is a *Summa* of Christian theology, but with a greater infusion than usual of philosophical reasoning. Alanus was acquainted with the celebrated *Liber de Civitate*

more as a cultivated humanist than as a Scholastic divine. His *Pohatations*, it has been said, "is to some extent an encyclopedia of the cultivated thought of the middle of the 12th century." The *Metaphysics* is a defence of logic against those who despised all philosophical training. But John recoiled from the idle casuistry which occupied his own logical contemporaries, and, mindful probably of their aimless ingenuity, he adds the caution that dialectic, valuable and necessary as it is, is "like the sword of Hercules in a pigmy's hand" unless there be added to the acquirement of the other sciences Catholic in spirit rather than dogmatic, John ranks himself at times among the Academics, "since, in those things about which a wise man may doubt, I depart not from their footsteps." The list which he gives of things which may be doubted (*quæ sunt dubitabilia sapientis*) is at once curious and instructive. It is not fitting to subtilize overmuch, and in the end John of Salisbury's solution is the practical one, his charitable spirit pointing him in particular to that love which is the fulfilling of the law.

The first period of Scholasticism being thus at an end, there is an interval of nearly half a century without any noteworthy philosophical productions. The cause of the new development of Scholasticism in the 13th century was the translation into Latin for the first time of the complete works of Aristotle. An inventory has been given of the scanty stock of works accessible to students in the 9th century. The stock remained unenlarged till towards the middle of the 12th century, when the remaining treatises of the *Organon* became known. Abelard expressly states that he knew only the *Categorias* and the *De Interpretatione*, but it seems from passages adduced by Prantl that he must, before the date of his *Dialectica*, have had some indirect and hazy knowledge of the contents of the other treatises, though without being able himself to consult a copy. The books made their way almost noiselessly into the schools. In 1132 Adam de Petit-Pont, it is stated, made a version of the *Prior Analytics*. Gilbert de la Porrée, who died in 1154, refers to the *Analytics* as currently known. His disciple Otto of Freising carried the *Analytics*, the *Topics*, and the *Soph. Elenchos* from France to Germany, probably in the translation of Boetius. John of Salisbury was acquainted with these and also with newer and more literal translations. But, while the fuller knowledge of the ancient logic resulted in an increase of formal acuteness, it appears to have been of but small benefit to serious studies till there was added to it a knowledge of the other works of Aristotle. This knowledge came to the Scholastics in the first instance through the medium of Arabian philosophy. (See ARABIAN PHILOSOPHY.) The doctrines and the works of Aristotle had been transmitted by the Nestorians to the Arabs, and among those kept alive by a succession of philosophers, first in the East and afterwards in the West. The chief of these, at least so far as regards the influence which they exerted on medieval philosophy, were Avicenna, Averroes, and Averroes. The unification by the last-mentioned of Aristotle's active intellect in all men, and his consequent denial of individual immortality are well known. The universal human intellect is made by him to proceed from the divine by a series of Neoplatonic emanations. In the course of the 12th century the writings of these men were introduced into France by the Jews of Andalusia, of Marseille, and Montpellier. "These writings contained," says Hauréau, "the text of the *Organon*, the *Physics*, the *Metaphysics*, the *Ethics*, the *De Anima*, the *Parva Naturalia*, and a large number of other treatises of Aristotle, accompanied by continuous commentaries. There arrived besides by the same channel the glosses of Theophrastus, of Simplicius, of Alexander

of Aphrodisias, of Philoponus, annotated in the same sense by the same hands. This was the rich but dangerous present made by the Musliman school to the Christian" (i. 382). To these must be added the Neoplatonically inspired *Fons Vitæ* of the Jewish philosopher and poet Ibn Gebirol, whom the Scholastics cited as Avicenna and believed to be an Arabian.

By special command of Raimund, archbishop of Toledo, the chief of these works were translated from the Arabic through the Castilian into Latin by the archdeacon Dominicus Gonzalvi with the aid of Johannes Avendath (= ben David), a converted Jew, about 1150. About the same time, or not long after, the *Liber de Causis* became known—a work destined to have a powerful influence on Scholastic thought, especially in the period immediately succeeding. Accepted at first as Aristotle's, and actually printed in the first Latin editions of his works, the book is in reality an Arabian compilation of Neoplatonic theses. Of a similar character was the pseudo-Aristotelian *Theologia* which was in circulation at least as early as 1200.

The first effects of this immense acquisition of new material were markedly unsettling on the doctrinal orthodoxy of the time. The apocryphal Neoplatonic treatises and the views of the Arabian commentators obscured for the first students the genuine doctrine of Aristotle, and the 13th century opens with quite a crop of mystical heresies. The mystical pantheism taught at Paris by Amalrich of Bena (ob. 1207, see AMALRICH and MYSTICISM), though based by him upon a revival of Scotus Erigena, was doubtless connected in its origin with the Neoplatonic treatises which now become current. The immanence of God in all things and His incarnation as the Holy Spirit in themselves appear to have been the chief doctrines of the Amalrichians. They are reported to have said, "Omnia unum, quia quicquid est Deus." About the same time David of Dinant, in a book *De Totius* (rendered by Albertus *De Divinisibus*), taught the identity of God with matter (or the indivisible principle of bodies) and nous (or the indivisible principle of intelligences)—an extreme Realism culminating in a materialistic pantheism. If they were diverse, he argued, there must exist above them some higher or common element or being, in which case this would be God, nous, or the original matter. The spread of the Amalrichian doctrine led to fierce persecutions, and the provincial council which met at Paris in 1209, after condemning the heresies of Amalrich and David, expressly decreed "that neither the books of Aristotle on natural philosophy, nor commentaries on the same, should be read, whether publicly or privately, at Paris." In 1215 this prohibition is renewed in the statutes of the university of Paris, as sanctioned by the papal legate. "Et quod legant libros Aristotelis de dialectica tam veteri quam de nova. Non legantur libri Aristotelis de metaphysica et naturalibus philosophia, nec summa de eisdem." Permission is thus given to lecture on the logical books, but those which had been known all along and those introduced since 1128, but the veto upon the *Physics* is extended to the *Metaphysics* and the summaries of the Arabian commentators. By 1231, however, the fears of the church were beginning to be allayed. A bull of Gregory IX. in that year makes no mention of any Aristotelian works except the *Physics*. As these had been "prohibited by the provincial council for specific reasons" they are not to be used in the university "till such time as they have been examined and purged of all suspicion of errors." Finally, in the year 1254, we find the university officially prescribing how many hours are to be devoted to the explanation of the *Metaphysics* and the principal physical treatises of Aristotle. These dates enable us to measure accurately the stages by

which the church accommodated itself to, and as it took possession of the Aristotelian philosophy. Growing knowledge of Aristotle's works and the multiplication of translations enabled students to distinguish the genuine Aristotle from the questionable accompaniments with which he had made his first appearance in Western Europe. Fresh translations of Aristotle and Averroes had already been made from the Arabic by Michael Scot and Hermannus Alemannus, at the instance of the emperor Frederick II, so that the whole body of Aristotle's works was at hand in Latin translations from about 1210 to 1225. Soon afterwards efforts began to be made to secure more literal translations direct from the Greek. Robert Grosseteste (ob. 1253) was one of the first to stir in this matter, and he was followed by Albertus Magnus and Thomas Aquinas. Half a century thus sufficed to remove the ban of the church, and soon Aristotle was recognized on all hands as "the philosopher" *par excellence*, the master of those that know. It even became customary to draw a parallel between him as the *præcursor Christi in naturalibus* and John the Baptist, the *præcursor Christi in gratiis*.

This unquestioned supremacy was not yielded, however, at the very beginning of the period. The earlier doctors who avail themselves of Aristotle's works, while bowing to his authority implicitly in matters of logic, are generally found defending a Christianized Platonism against the doctrine of the *Metaphysics*. So it is with Alexander of Hales (ob. 1245), the first Scholastic who was acquainted with the whole of the Aristotelian works and the Arabian commentaries upon them. He was more of a theologian than a philosopher, and in his chief work, *Summa Universæ Theologie*, he simply employs his increased philosophical knowledge in the demonstration of theological doctrines. So great, however, did his achievement seem that he was honoured with the titles of *Doctor Irrefragabilis* and *Theologorum Monarcha*. Alexander of Hales belonged to the Franciscan order, and it is worth remarking that it was the mendicant orders which now came forward as the protagonists of Christian learning and faith and, as it were, reconquered Aristotle for the church. During the first half of the 13th century, when the university of Paris was plunged in angry feuds with the municipality, feuds which even led at one time (1229) to the flight of the students in a body, the friars established teachers in their convents in Paris. After the university had settled its quarrels these continued to teach, and soon became formidable rivals of the secular lecturers. After a severe struggle for academical recognition they were finally admitted to all the privileges of the university by a bull of Alexander IV. in 1253. The Franciscans took the lead in this intellectual movement with Alexander of Hales and Bonaventura, but the Dominicans were soon able to boast of two greater names in Albert the Great and Thomas Aquinas. Still later Duns Scotus and Occam were both Franciscans. Alexander of Hales was succeeded in his chair of instruction by his pupil John of Rochelle, who died in 1271 but taught only till 1253. His treatise *De Anima*, on which Hauréau lays particular stress, is interesting as showing the greater scope now given to psychological discussions. This was a natural result of acquaintance with Aristotle's *De Anima* and the numerous Greek and Arabian commentaries upon it, and it is observable in most of the writers that have still to be mentioned. Even the nature of the universals is no longer discussed from a purely logical or metaphysical point of view, but becomes connected with psychological questions. And, on the whole, the widening of intellectual interests is the chief feature by which the second period of Scholasticism may be distinguished from the first. In some respects

there is more freshness and interest in the speculations which burst forth so ardently in the end of the 11th and the first half of the 12th century. Albert and Aquinas, no doubt stood on a higher level than Anselm and Abelard, not merely by their wider range of knowledge but also by the intellectual massiveness of their achievements, but it may be questioned whether the earlier writers did not possess a greater force of originality and a keener talent. Originality was at no time the strong point of the Middle Ages, but in the later period it was almost of necessity buried under the mass of material suddenly thrust upon the age, to be assimilated. On the other hand, the influence of this new material is everywhere evident in the wider range of questions which are discussed by the doctors of the period. Interest is no longer to the same extent concentrated on the one question of the universals. Other questions, says Hauréau, are "placed on the order of the day,—the question of the elements of substance, that of the principle of individuation, that of the origin of the ideas, of the manner of their existence in the human understanding and in the divine thought, as well as various others of equal interest" (i. 420). Some of these, it may be said, are simply the old Scholastic problem in a different garb, but the extended horizon of which Hauréau speaks is amply proved by mere reference to the treatises of Albert and St Thomas. They there seek to reproduce for their own time all the departments of the Aristotelian system.

John of Rochelle was succeeded in 1253 by John Bonaventura, better known as Bonaventura (1221-74), who had also been a pupil of Alexander of Hales. But the fame of "the Seraphic Doctor" is connected more closely with the history of mysticism (see MYSTICISM) than with the main stream of Scholastic thought. Like his master, he defended Plato—or what he considered to be the Platonic theory—against the attacks of Aristotle. Thus he defended the *universalia ante rem* as exemplars existent in the divine intelligence, and censured Aristotle's doctrine of the eternity of the world. Among the earlier teachers and writers of this century we have also to name William of Auvergne (ob. 1249), whose treatises *De Universo* and *De Anima* make extensive use of Aristotle and the Arabians, but display a similar Platonic leaning. The existence of intelligences in our minds is, he maintains, a sufficient demonstration of the existence of an intelligible world, just as the ideas of sense are sufficient evidence of a sensible world. This archetypal world is the Son of God and true God. Robert Grosseteste, important in the sphere of ecclesiastical politics, has been already mentioned as active in procuring translations of Aristotle from the Greek. He also wrote commentaries on logical and physical works of Aristotle. Michael Scot, the renowned wizard of popular tradition, earned his reputation by numerous works on astrology and alchemy. His connexion with philosophy was chiefly in the capacity of a translator. Vincent of Beauvais (ob. 1264) was the author of an encyclopedic work called *Speculum Majus*, in which, without much independent ability, he collected the opinions of ancient and mediæval writers on the most diverse points, transcribing the fragments of their works which he deemed most interesting.

Albertus Magnus introduces us at once to the great age of Scholasticism. Born in Swabia in 1193, he lived to the great age of eighty-seven, dying at Cologne in 1280. The limits of his life thus include that of his still greater pupil Thomas Aquinas, who was born in 1227 and died while still comparatively young in 1274. For this reason, and because the system of Thomas is simply that of Albert rounded to a greater completeness and elaborated in parts by the subtle intellect of the younger man, it will be convenient not to separate the views of master and scholar,

except where their differences make it necessary, and in giving an account of them common system it will be well to present it at once in its most perfect form. Albert was "the first Scholastic who reproduced the whole philosophy of Aristotle in systematic order with constant reference to the Arabic commentators, and who remodelled it to meet the requirements of ecclesiastical dogma" (Ueberweg, i 436). On this account he was called by his contemporaries "the Universal Doctor." But in Albert it may be said that the matter was still too new and too multifarious to be thoroughly mastered. The fabric of knowledge is not fitly jointed together in all its parts, the theologian and the philosopher are not perfectly fused into one individual, but speak sometimes with different voices. In St Thomas this is no longer so, the fusion is almost perfect. The pupil, entering into his master's labours, was able from the first to take a more comprehensive survey of the whole field, and in addition he was doubtless endowed with an intellect which was finer, though it might not be more powerful, than his master's. Albert had the most touching affection for his distinguished scholar. When he went to Paris in 1245 to lecture and to take his doctor's degree, his pupil accompanied him, and, on their return to Cologne, Aquinas taught along with his master in the great Dominican school there. At a later date, when Aquinas proceeded to Paris to lecture independently, he occupied the Dominican chair at the same time that Bonaventura held the Franciscan professorship. They received the degree of doctor in the same year, 1257. Rivals in a manner though they were, and differing on points of philosophy, the Angelic and Seraphic Doctors were united in friendship and Christian charity.

The monotheistic influence of Aristotle and his Arabian commentators shows itself in Albert and Aquinas, at the outset, in the definitive fashion in which the "mysteries" of the Trinity and the Incarnation are henceforth detached from the sphere of rational or philosophical theology. So long as the Neoplatonic influence remained strong, attempts were still made to demonstrate the doctrine of the Trinity, chiefly in a mystical sense as in Eriugena, but also by orthodox churchmen like Anselm. Orthodoxy, whether Catholic or Protestant, has since generally adopted Thomas's distinction. The existence of God is maintained by Albert and Aquinas to be demonstrable by reason; but here again they reject the ontological argument of Anselm, and restrict themselves to the *a posteriori* proof, rising after the manner of Aristotle from that which is prior for us (*πρὸτερον πρὸς ἡμᾶς*) to that which is prior by nature or in itself (*πρὸτερον φύσει*). God is not fully comprehensible by us, says Albert, because the finite is not able to grasp the infinite, yet he is not altogether beyond our knowledge, our intellects are touched by a ray of his light, and through this contact we are brought into communion with him. God, as the only self-subsistent and necessary being, is the creator of all things. Here the Scholastic philosophy comes into conflict with Aristotle's doctrine of the eternity of the world. Albert and Aquinas alike maintain the beginning of the world in time, time itself only exists since the moment of this marvellous creation. But Thomas, though he holds the fact of creation to be rationally demonstrable, regards the beginning of the world *in time* as only an article of faith, the philosophical arguments for and against being inconclusive.

The question of universals, though fully discussed, no longer forms the centre of speculation. The great age of Scholasticism presents, indeed, a substantial unanimity upon this vexed point, maintaining at once, in different senses, the existence of the universals *ante rem*, *in re*, and *post rem*. Albert and Aquinas both profess the moderate

Aristotelian Realism which treats genera and species only as *substantiæ secundæ*, yet as really inherent in the individuals, and constituting their form or essence. The universals, therefore, have no existence, as universals, *in rebus natura*, and Thomas endorses, in this sense, the polemic of Aristotle against Plato's hypostatized abstractions. But, in the Augustinian sense of ideas immanent in the divine mind, the universal *ante rem* may well be admitted as possessing ideal existence. Finally, by abstraction from the individual things of sense, the mind is able to contemplate the universal apart from its accompaniments (*animal sine homine, asino, et aliis speciebus*), these subjective existences are the *universalia post rem* of the Nominalists and Conceptualists. But the difficulties which embarrassed a former age in trying to conceive the mode in which the universal exists in the individual reappear in the systems of the present period as the problem of the *principium individuationis*. The universal, as the form or essence of the individual, is called its *principium quidditatis* (its "what-ness" or nature), but, besides possessing a general nature and answering to a general definition (i.e., being a "what"), every man, for example, is this particular man, here and now. It is the question of the particularity or "this-ness" (*haecceitas*, as Duns Scotus afterwards named it) that embarrasses the Scholastics. Albert and Aquinas agree in declaring that the principle of individuation is to be found in matter, not, however, in matter as a formless substrate but in determinate matter (*materia signata*), which is explained to mean matter quantitatively determined in certain respects. "The variety of individuals," says Albert, "depends entirely upon the division of matter" (*individuationum multitudo fit omnis per divisionem materiae*), and Aquinas says "the principle of the diversity of individuals of the same species is the quantitative division of matter" (*diversio materiae secundum quantitatem*), which his followers render by the abbreviated phrase *materia quantita*. A tolerably evident shortcoming of such a doctrine is that, while declaring the quantitative determination of matter to be the individual element in the individual, it gives no account of how such quantitative determination arises. Yet the problem of the individual is really contained in this prior question; for determinate matter already involves particularity or this-ness. This difficulty was presently raised by Duns Scotus and the realistically-inclined opponents of the Thomist doctrine. But, as Ueberweg points out, it might fairly be urged by Aquinas that he does not pretend to explain how the individual is actually created, but merely states what he finds to be an invariable condition of the existence of individuals. Apart from this general question, a difficulty arises on the Thomist theory in regard to the existence of spirits or disembodied personalities. This affects first of all the existence of angels, in regard to whom Aquinas admits that they are immaterial or separate forms (*formae separatae*). They possess the principle of individuation in themselves, he teaches, but plurality of individuals is in such a case equivalent to plurality of species (*in eis tot sunt species quot sunt individua*). The same difficulty, however, affects the existence of the disembodied human spirit. If individuality depends in matter, must we not conclude with Averroes that individuality is extinguished at death, and that only the universal form survives? This conclusion, it is needless to say, is strenuously opposed both by Albert and Thomas. Albert wrote a special treatise *De Unitate Intellectus contra Averroistas*, and Thomas in his numerous writings is even more explicit. It is still admissible, however, to doubt whether the hateful consequence does not follow consistently from the theory laid down. Aquinas regards the souls of men, like the angels, as immaterial forms; and he includes in the soul-unit, so to

"Mysteries" excluded from philosophy

speak, not merely the *anima rationalis* of Aristotle, but also the vegetative, sensitive, appetitive, and motive functions. The latter depend, it is true, on bodily organs during our earthly sojourn, but the dependence is not necessary. The soul is created by God when the body of which it is the entelechy is prepared for it. It is the natural state of the soul to be united to a body (*lamine prius content esse unita corpori quam esse a corpore separata*), but being immaterial it is not affected by the dissolution of the body. The soul must be immaterial since it has the power of cognizing the universal, and its immortality is further based by St Thomas on the natural longing for unending existence which belongs to a being whose thoughts are not confined to the "here" and "now," but are able to abstract from every limitation.

Thomism, which was destined to become the official philosophy of the Roman Catholic Church, became in the first instance the accepted doctrine of the Dominican order, who were presently joined in this allegiance by the Augustinians. The Franciscan order, on the other hand, early showed their rivalry in attacks upon the doctrines of Albert and Aquinas. One of the first of these was the *Reprehensio uen. seu Correctio vni. Fratris Thomae*, published in 1285 by William Lamsire, in which the Averroistic consequences of the Thomist doctrine of individuation are already pressed home. More important was Richard of Middleton (died about 1300), who anticipated many of the objections urged soon after him by Duns Scotus. This renowned opponent of the Thomist doctrine was born in the second half of the 13th century, and after achieving an extraordinary success as a lecturer in Oxford and Paris died at an early age in the year 1308. His system is conditioned throughout by its relation to that of Aquinas, of which it is in effect an elaborate criticism. The chief characteristic of this criticism is well expressed in the name bestowed on Duns by his contemporaries—*Doctor Subtilis*. It will be sufficient therefore to note the chief points in which the two great antagonists differ. In general it may be said that Duns shows less confidence in the power of reason than Thomas, and to that extent Erdmann and others are right in looking upon his system as the beginning of the decline of Scholasticism. For Scholasticism, as perfected by Aquinas, implies the harmony of reason and faith, in the sense that they both teach the same truths. To this general position Aquinas, it has been seen, makes several important exceptions, but the exceptions are few in number and precisely defined. Scotus extends the number of theological doctrines which are not, according to him, susceptible of philosophical proof, including in this class the creation of the world out of nothing, the immortality of the human soul, and even the existence of an almighty divine cause of the universe (though he admits the possibility of proving an ultimate cause superior to all else). His destructive criticism thus tended to reintroduce the dualism between faith and reason which Scholasticism had laboured through centuries to overcome, though Scotus himself, of course, had no such sceptical intention. But the way in which he founded the leading Christian doctrines (after confessing his inability to rationalize them) on the arbitrary will of God was undoubtedly calculated to help in the work of disintegration. And it is significant that this primacy of the undetermined will (*voluntas superior intellectus*) was the central contention of the Scotists against the Thomist doctrine. Voluntary action, St Thomas had said, is action originating in self or in an internal principle. As compared with the animals, which are immediately determined to their ends by the instinct of the moment, man determines his own course of action freely after a certain process of rational comparison (*ex collatione quadam rationis*).

It is evident that the freedom here spoken of is a freedom from the immediacy of impulse—a freedom based upon our possession of reason as a power of comparison, memory, and forethought. Nothing is said of an absolute freedom of the will, the will is, on the contrary, subordinated to the reason in so far as it is supposed to choose what reason pronounces good. Accordingly, the Thomist doctrine may be described as a moderate determinism. To this Scotus opposed an indeterminism of the extreme type describing the will as the possibility of determining itself motivelessly in either of two opposite senses. Transferred to the divine activity, Thomas's doctrine led him to insist upon the *persensus boni*. The divine will is, equally with the human, subject to a rational determination; God commands what is good because it is good. Scotus, on the other hand, following out his doctrine of the will, declared the good to be so only by arbitrary imposition. It is good because God willed it, and for no other reason, had He commanded precisely the opposite course of conduct, that course would have been right by the mere fact of His commanding it. Far removed from actuality as such speculations regarding the priority of intellect or will in the Divine Being may seem to be, the side taken is yet a sure index of the general tendency of a philosophy. Aquinas is on the side of rationalism, Scotus on the side of scepticism.

While agreeing with Albert and Thomas in maintaining the threefold existence of the universals, Duns Scotus attacked the Thomist doctrine of individuation. The distinction of the universal essence and the individualizing determinations in the individual does not coincide, he maintained, with the distinction between form and matter. The additional determinations are as truly "form" as the universal essence. If the latter be spoken of as *quidditas*, the former may be called *haecceitas*. Just as the genus becomes the species by the addition of formal determinations called the difference, so the species becomes the individual by the addition of fresh forms of difference. As *animal* becomes *homo* by the addition of *humanitas*, so *homo* becomes Socrates by the addition of the qualities signified by *Socratas*. It is false, therefore, to speak of matter as the principle of individuation, and if this is so there is no longer any foundation for the Thomist view that in angelic natures every individual constitutes a species apart. Notwithstanding the above doctrine, however, Scotus holds that all created things possess both matter and form—the soul, for example, possessing a matter of its own before its union with the body. But the matter of spiritual beings is widely different from the matter of corporeal things. In his treatment of the conception of matter, Duns shows that he inclined much more to the Realism which makes for pantheism than was the case with the Aristotelianism of Thomas. A perfectly formless matter (*materia prima*) was regarded by him as the universal substratum and common element of all finite existences. He expressly intimates in this connexion his acceptance of Avicenna's position. *Ego autem ad positionem Avicennae redeo*, that is, to the Neoplatonically conceived *Pons Vitae* of the Jew Gebrul.

In the end of the 13th century and the beginning of the 14th the Thomists and Scotists divided the philosophical and theological world between them. Among the Thomists may be named John of Paris, Ægidius of Lessines (wrote in 1278), Bernard of Triha (1240–92), and Peter of Auvergne. More important was Ægidius of Colonna (1247–1316), general of the Augustinian order, surnamed *Doctor Fundamentarius* or *Fundamentarius*. Hervaeus Natalis (d. 1393) and Thomas Bradwardine (d. 1349) were determined opponents of Scotism. Siger of Brabant and Gottfried of Fontaines, chancellor of the university of Paris, taught Thomism

at the Sorbonne, and through Humbert, abbot of Pulli, the doctrine won admission to the Cistercian order. Among the disciples of Duns Scotus are mentioned John de Bassolis, Franciscus de Mayronis (ob. 1327), Antonius Andrea (ob. c. 1320), John Dumbleton and Walter Burleigh (1275-1337) of Oxford, Nicolaus de Lyra, Peter of Aquila, and others. Henry Goethals, or Henry of Ghent (Hunricus Gandavensis, 1217-93), surnamed *Doctor Solennis*, occupied on the whole an independent and pre-Thomist position, leaning to an Augustinian Platonism. Gerard of Bologna (ob. 1317) and Raoul de Britany are rather to be ranked with the Thomists. So also is Petrus Hispanus (died 1277 as Pope John XXI.), who is chiefly important, however, as the author of the much-used manual *Summula Logicales*, in which the logic of the schools was expanded by the incorporation of fresh matter of a semi-grammatical character. Petrus Hispanus had predecessors, however, in William of Shyreswood (died 1249 as chancellor of Lincoln) and Lambert of Auxerre, and it has been hotly disputed whether the whole of the additions are not originally due to the Byzantine *Synopsis* of Pselus. By far the greatest disciple of Aquinas is Dante Alighieri, in whose *Divina Commedia* the theology and philosophy of the Middle Ages, as fixed by Saint Thomas, have received the immortality which poetry alone can bestow. Two names stand apart from the others of the century—Raymond Lully (1234-1315) and Roger Bacon (1214-94). The *lrs Magus* of the former professed by means of a species of logical machine to give a rigid demonstration of all the fundamental Christian doctrines, and was intended by its author as an unfailing instrument for the conversion of the Saracens and heathen. Roger Bacon was rather a pioneer of modern science than a Scholastic, and persecution and imprisonment were the penalty of his opposition to the spirit of his time.

The last stage of Scholasticism preceding its dissolution is marked by the revival of Nominalism in a militant form. This doctrine is already to be found in Petrus Aureolus (ob. 1321), a Franciscan trained in the Scotist doctrine, and in William Durand of St Pourçain (ob. 1332), a Dominican who passed over from Thomism to his later position. But the name with which the Nominalism of the 14th century is historically associated is that of the "Invincible Doctor," William of Occam (ob. 1347), who, as the author of a doctrine which came to be almost universally accepted, received from his followers the title *Venerabilis Inceptor*. The hypostatization of abstractions is the error against which Occam is continually fighting. His constantly recurring maxim—known as Occam's razor—is *Entia non sunt multiplicanda praeter necessitatem*. The Realists, he considers, have greatly sinned against this maxim in their theory of a real universal or common element in all the individuals of a class. From one abstraction they are led to another, to solve the difficulties which are created by the realization of the first. Thus the great problem for the Realists is how to derive the individual from the universal. But the whole inquiry moves in a world of unrealities. Everything that exists, by the mere fact of its existence, is individual (*Quaelibet res, eo ipso quod est, est haec res*). It is absurd therefore to seek for a cause of the individuality of the thing other than the cause of the thing itself. The individual is the only reality, whether the question be of an individual thing in the external world or an individual state in the world of mind. It is not the individual which needs explanation but the universal. Occam reproaches the "modern Platonists" for perverting the Aristotelian doctrine by these speculations, and claims the authority of Aristotle for his own Nominalistic doctrine. The universal is not anything really existing; it is a *terminus* or

predicable (whence the followers of Occam were at first called Terminists). It is no more than a "mental concept signifying univocally several singulars." It is a natural sign representing these singulars, but it has no reality beyond that of the mental act by which it is produced and that of the singulars of which it is predicated. As regards the existence (if we may so speak) of the universal *in mente*, Occam indicates his preference, on the ground of simplicity, for the view which identifies the concept with the *actus intellectus* ("une modalité passagère de l'âme," as Hauréau expresses it), rather than for that which treats ideas as distinct entities within the mind. And in a similar spirit he explains the *univoca solutio* as being, not substantial existences in God, but simply God's knowledge of things—a knowledge which is not of universals but of singulars, since these alone exist *realtate*. Such a doctrine, in the stress it lays upon the singular, the object of immediate perception, is evidently inspired by a spirit differing widely even from the moderate Realism of Thomas. It is a spirit which distrusts abstractions, which makes for direct observation, for inductive research. Occam, who is still a Scholastic, gives us the Scholastic justification of the spirit which had already taken hold upon Roger Bacon, and which was to enter upon its rights in the 15th and 16th centuries. Moreover, there is no denying that the new Nominalism not only represents the love of reality and the spirit of induction, but also contains in itself the germs of that empiricism and sensualism so frequently associated with the former tendencies. St Thomas had regarded the knowledge of the universal as an intellectual activity which might even be advanced in proof of the immortality of the soul. Occam, on the other hand, maintains in the spirit of Hobbes that the act of abstraction does not presuppose any activity of the understanding or will, but is a spontaneous secondary process by which the first act (perception) or the state it leaves behind (*habitus derelictus* *ex primo actu*—Hobbes's "decaying sense") is naturally followed, as soon as two or more similar representations are present.

In another way also Occam heralds the dissolution of Scholasticism. The union of philosophy and theology is the mark of the Middle Ages, but in Occam their severance is complete. A pupil of Scotus, he carried his master's criticism farther, and denied that any theological doctrines were rationally demonstrable. Even the existence and unity of God were to be accepted as articles of faith. The *Centilogium Theologicum*, which is devoted to this negative criticism and to showing the irrational consequences of many of the chief doctrines of the church, has often been cited as an example of thoroughgoing scepticism under a mask of solemn irony. But if that were so, it would still remain doubtful, as Erdmann remarks, whether the irony is directed against the church or against reason. On the whole, there is no reason to doubt Occam's honest adhesion to each of the two guides whose contrariety he laboured to display. None the less is the position in itself an untenable one and the parent of scepticism. The principle of the twofold nature of truth¹ thus embodied in Occam's system was unquestionably adopted by many merely to cloak their theological unbelief, and, as has been said, it is significant of the internal dissolution of Scholasticism. Occam denied the title of a science to theology, emphasizing, like Scotus, its practical character. He also followed his master in laying stress on the arbitrary will of God as the foundation of morality.

¹ This principle appeared occasionally at an earlier date, for example in Simon of Tournay about 1290. It was expressly censured by Pope John XXI in 1276. But only in the period following Occam did it become a current doctrine.

Spread of Nominalism was at first met by the opposition of the church and the constituted authorities. In 1539 Occam's treatises were put under a ban by the university of Paris, and in the following year Nominalism was solemnly condemned. Nevertheless the new doctrine spread on all hands. Dominicans like Armand de Beaufort (ob. 1534) and Gregory of Rimini accepted it. It was taught in Paris by Albert of Saxony (about 1350-60) and Marsilius of Inghen (about 1364-71, afterwards at Heidelberg), as well as by Johannes Buridanus, who was rector of the university as early as 1227. We find, however, as late as 1473 the attempt made to bind all teachers in the university of Paris by oath to teach the doctrines of Realism, but this expiring effort was naturally ineffectual, and from 1481 onward even the show of obedience was no longer exacted.

Pierre d'Ailly (1350-1425) and John Gerson (Jean Chailher de Gerson, 1363-1429), both chancellors of the university of Paris, and the former a cardinal of the church, are the chief figures among the later Nominalists. Both of them, however, besides their philosophical writings, are the authors of works of religious edification and mystical piety. They thus combine temporarily in their own persons what was no longer combined in the spirit of the time, or rather they satisfy by turns the claims of reason and faith. Both are agreed in placing repentance and faith far above philosophical knowledge. They belong indeed (Gerson in particular) to the history of mysticism rather than of Scholasticism, and the same may be said of another cardinal, Nicolaus of Cusa (1401-64), who is sometimes reckoned among the last of the Scholastics, but who has more affinity with Scotus Eriugena than with any intervening teacher. The title "last of the Scholastics" is commonly given to Gabriel Biel, the summarizer of Occam's doctrine, who taught in Tübingen, and died in the year 1495. The title is not actually correct, and might be more fitly borne by Francis Suarez, who died in 1617. But after the beginning of the 15th century Scholasticism was divorced from the spirit of the time, and it is useless to follow its history further. As has been indicated in the introductory remarks, the end came both from within and from without. The harmony of reason and faith had given place to the doctrine of the dual nature of truth. While this sceptical thesis was embraced by philosophers who had lost their interest in religion, the spiritually minded sought their satisfaction more and more in a mysticism which frequently cast itself loose from ecclesiastical trammels. The 14th and 15th centuries were the great age of German mysticism, and it was not only in Germany that the tide set this way. Scholasticism had been the expression of a universal church and a common learned language. The university of Paris, with its scholars of all nations numbered by thousands, was a symbol of the intellectual unity of Christendom, and in the university of Paris, it may almost be said, Scholasticism was reared and flourished and died. But the different nations and tongues of modern Europe were now beginning to assert their individuality, and men's interests ceased to be predominately ecclesiastical. Scholasticism, therefore, which was in its essence ecclesiastical, had no longer a proper field for its activity. It was in a manner deprived of its accustomed subject-matter and died of inanition. Philosophy, as Hauréau finely says, was the passion of the 13th century, but in the 15th humanism, art, and the beginnings of science and of practical discovery were busy creating a new world, which was destined in due time to give birth to a new philosophy.

Authorities.—Besides the numerous works dealing with individual philosophers, the chief histories of Scholasticism are those of Hauréau (*De la Philosophie Scolastique*, 2 vols., 1850, revised

and expanded in 1870 as *Histoire de la Phil. Scol.*), Kauleh (*Geschichte der schol. Philosophie*), and Stahl (*Gesch. der Phil. des Mittelalters*). Supplementary details are given in Hauréau's *Synopsis des Historiques de Litterature*, 1861, and in E. L. Poole's *Foundations of the History of Medieval Thought* (1854). The accounts of medieval thought given by Ritter, Eucken, and Uebachs, in their general histories of philosophy are exceedingly good. There are also notices of the leading systems in Milman's *History of Latin Christianity*, and the same writers are consulted from the theological side in many works devoted to theology and the history of dogma. Jourdain's *Recherches Critiques sur l'Age de l'Inquisition* (*Trois Lettres Latines d'Albi*) (Paris, 1819, 2d edition, 1843), Roussier's *Études sur la Philosophie dans le Moyen-Âge* (1849-52), Cousin's Introduction to his *Ouvrages écrits de Philosophie* (1836), and Paul's *Geschichte der Logik im Mittelalter* (4 vols., 1855-70) are invaluable aids in studying the history of medieval thought. (A SE.)

SCHOMBERG, FREDERICK ARMAND, DUK OF (c. 1619-1690), marshal of France and English general, was descended from an old family of the Palatinate, and was born about 1619. He began his military career under Frederick Henry, prince of Orange, and after his death in 1659 entered the service of France, acquiring ultimately a reputation as a general second only to that of Turenne and the prince of Condé. In Paris he made the acquaintance of Charles II, who according to his own account "admitted him to great familiarities with him." In 1660 he was sent to Portugal, and on his way thither passed through England to concert with Charles measures for supporting that country in the contest with Spain. For his services to Portugal he was in 1668 made a grandee, and received a pension of £5000 a year. In 1673 he was invited by Charles to England, with the view of taking command of the army, but so strong was the general sentiment against the appointment as savouring of French influence that it was not carried into effect. He therefore again entered the service of France, and after his capture of Bellegarde, 29th July 1675, received the rank of marshal. In subsequent campaigns he continued to add to his reputation until the revocation of the edict of Nantes (22d October 1685) compelled him as a Protestant to quit his adopted country. Ultimately he was chosen commander-in-chief of the forces of the elector of Brandenburg, and with the elector's consent he joined the prince of Orange on his expedition to England in 1688, as second in command to the prince. The following year he was made a knight of the Garter, created successively baron, marquis, and duke, and received from the House of Commons a vote of £100,000. In August he was appointed commander-in-chief of the expedition to Ireland against James II. After capturing Carrickfergus he marched unopposed through a country desolated before him to Dundalk, but, as the bulk of his forces were raw and undisciplined as well as inferior in numbers to the enemy, he deemed it imprudent to risk a battle, and entrenching himself at Dundalk declined to be drawn beyond the circle of his defences. Shortly afterwards pestilence broke out, and when he retired to winter quarters in Ulster his forces were in a more shattered condition than if they had sustained a severe defeat. At the same time competent authorities were agreed that the policy of masterly inactivity which he pursued was the only one open to him. In the spring he began the campaign with the capture of Charlemont, but no advance southward was made until the arrival of William. At the Boyne (July 1, 1690) Schomberg gave his opinion against the determination of William to cross the river in face of the opposing army. In the battle he held command of the centre, and, while riding through the river without his cuirass to rally his men, was surrounded by a band of Irish horsemen and met instantaneous death. He was buried in St Patrick's cathedral, Dublin, where there is a monument to him, with a Latin inscription by Dean Swift. Schomberg was generally regarded in Eng-

The
"last
of the
Schol-
astics."

land with great respect, and his manners and bearing rendered him universally popular.

SCHÖNEBIN, CHRISTIAN FRIEDRICH (1799-1868), from 1828 professor of chemistry at Basel, is known as the discoverer of OZONE (*q.v.*)

SCHÖNEBECK, a town of Prussian Saxony, on the left bank of the Elbe, 9 miles above Magdeburg. It contains manufactories of chemicals, machinery, percussion caps, starch, white lead, and various other articles, but is chiefly noted for its extensive salt springs and works, which produce about 70,000 tons of salt per annum. Large beds of rock-salt also occur in the neighbourhood, in which shafts have been sunk to a depth of more than 1200 feet. There is a harbour on the Elbe here, and a brisk trade is carried on in grain and timber. In 1855 Schönebeck contained 13,316 inhabitants (including the adjoining communities of Salze, Elmen, and Frohse, about 20,000).

SCHÖNEBERG, a so-called Prussian "village," in the province of Brandenburg, is now really a suburb of Berlin, which it adjoins on the south-west. It contains the royal botanic garden, a large maison de santé, and manufactories of paper collars, enamels, railway rolling-stock, and chemicals. The population in 1880 was 11,180. The foundation of Alt-Schöneberg is ascribed to Albert the Bear (12th century), while Neu-Schöneberg was founded by Frederick the Great in 1750 to accommodate some Bohemian weavers, exiled for their religion (*cf.* RIXDORF).

SCHONGAUER, or SHOEX, MARTIN (1450-c. 1488), the most able engraver and painter of the early German school. His father was a goldsmith named Casper, a native of Augsburg, who had settled at Colmar, where the chief part of Martin's life was spent.¹ Schongauer established at Colmar a very important school of engraving, out of which grew the "little masters" of the succeeding generation, and a large group of Nuremberg artists. As a painter, Schongauer was a pupil of the Flemish Roger Van der Weyden the Elder, and his rare existing pictures closely resemble, both in splendour of colour and exquisite minuteness of execution, the best works of contemporary art in Flanders. Among the very few paintings which can with certainty be attributed to him, the chief is a magnificent altarpiece in the church of St Martin, at Colmar, representing the Virgin and Child, crowned by Angels, with a background of roses—a work of the highest beauty, and large in scale, the figures being nearly life size. The Colmar Museum possesses eleven panels by his hand, and a small panel of David with Goliath's Head in the Munich Gallery is attributed to him. The miniature painting of the Death of the Virgin in the English National Gallery is probably the work of some pupil.² In 1488 Schongauer died at Colmar, according to the register of St Martin's church.

The main work of Schongauer's life was the production of a large number of most highly finished and beautiful engravings, which were largely sold, not only in Germany, but also in Italy and even in England. In this way his influence was very widely extended. Vasari speaks of him with much enthusiasm, and says that Michelangelo copied one of his engravings—the Trial of St Anthony.³ Schongauer was known in Italy by the names "Bel

Martino" and "Martino d'Anversa." His subjects are always religious; more than 130 prints from copper by his hand are still known, and about 100 more are the production of his *bottega*.⁴ Most of his pupils' plates as well as his own are signed M+S. Among the most beautiful of Schongauer's engravings are the series of the Passion and the Death of the Virgin, the Virgin, and the series of the Wise and Foolish Virgins, as much as £420 has been given for a fine state of the Coronation plate. All are remarkable for their miniature-like treatment, their brilliant touch, and their chromatic force. Some, such as the Death of the Virgin and the Adoration of the Magi, are richly-filled compositions of many figures, treated with much largeness of style in spite of their minute scale. Though not free from the mannerism of his age and country, Schongauer possessed a true feeling for beauty and for dignity of pose, and in technical power over his grave and copper plate he has never been surpassed.

The British Museum possesses a fine collection of Schongauer's prints. Fine facsimiles of his engravings have been produced by Amand-Durand with text by Duplessis, Paris, 1851.

SCHOOLCRAFT, HENRY ROWE (1793-1864), a North-American traveller, ethnologist, and author, was born 28th March 1793 at Watervliet (now called Guilderland), Albany county, New York, and died at Washington 10th December 1864. After studying chemistry and mineralogy at college he had several years' experience of their practical application, especially at a glass-factory of which his father was manager, and in 1817 published his *Vitreology*. In the following year he was appointed to the Geological Survey of Missouri and Arkansas, and in 1819 he published his *View of the Lead Mines of Missouri*. Soon after he accompanied General Cass as geologist in his expedition to the Lake Superior copper region, and evinced such capacity for good exploring work on the frontier that in 1823 he was appointed "agent for Indian affairs." He then married the granddaughter of an Indian chief, and during several years' official work near Lake Superior he acquired a vast fund of accurate information as to the physique, language, social habits, and tribal institutions of the American natives. From 1828 to 1832 Schoolcraft was an active member of the Michigan legislature, during the same period delivering lectures on the grammatical structure of the Indian language, which procured him the gold medal of the French Institute. In 1832 also, when on an embassy to some Indians, he ascertained the real source of the Mississippi to be Lake Itasca.

Previous to 1832 he had published *Travels in the Central Portions of the Mississippi Valley*, and in 1839 appeared his *Algonacques*, containing "Memoirs of a Residence of Thirty Years with the Indian Tribes," and also, notably, "The Myth of Haxatha, and other Oral Legends,"—probably the first occurrence of the name immortalized (in 1855) in Longfellow's poem. Schoolcraft's literary activity was indeed remarkable, since, besides his ethnological writings he composed a considerable quantity of poetry and several minor prose works, especially *Notes on the Troquois* (1848), *Statistics of the Six Nations* (1845), *Scenes and Adventures in the Ozark Mountains* (1853). His principal book, *Historical and Statistical Information respecting the Indian Tribes of the United States*, illustrated with 398 well-executed plates from original drawings, was issued under the patronage of Congress in six quarto volumes, from 1851 to 1857. It is a vast mine of ethnological researches as to the Red Men of America, systematically arranged and fully, if not exhaustively, detailed,—describing not only their origin, history, and antiquities, but the physical and mental "type," the tribal characteristics, the vocabulary and grammar, the religion and mythology. Schoolcraft's diplomatic work on the Indian frontier was important,—more than sixteen millions of acres being added to the States' territory by means of treaties which he negotiated.

given by the lovely Faenza plate in the British Museum, on which is painted a copy of Martin's beautiful engraving of the Death of the Virgin, see POTTERY, vol. xix p. 627.

⁴ See Barth, *Peintre Graveur*, and Willshire, *Ancient Prints*, best edition of 1877. According to a German tradition Schongauer was the inventor of printing from metal plates, he certainly was one of the first who brought the art to perfection. See an interesting article by Sidney Colvin in the *Jahrbuch der k. preussischen Kunstsammlung*, vi p. 69, Berlin, 1885.

¹ The date of Schongauer's birth is usually given wrongly as c. 1420, he was really born about thirty years later, and is mentioned by A. Dürer as being a young apprentice in 1470. His portrait in the Munich Pinakothek is now known to be a copy by Burgkmair, painted after 1510, from an original of 1483, not 1458 as has been supposed. The date of Schongauer's death, 1499, written on the back of the panel by Burgkmair is obviously a blunder, see Hensler in *Neumann's Archiv*, 1867, p. 129, and Wurzbach, *M. Schongauer*, Vienna, 1880. These contradict the view of Gontzwiller, in his *Martin Schongauer et son Ecole*, Paris, 1875. Cf. Schnaase, "Gesch. M. Schongauer's," in *Mittheil. der K. K. Commission*, 1866, No. 7.

² Another painting of the same subject in the Doria Palaces in Rome (usually attributed to Dürer) is given to Schongauer by Crowe and Cavalcaselle, *Flemish Painters*, London, 1873, p. 369, but the execution is not equal to Schongauer's wonderful touch.

³ An interesting example of Schongauer's popularity in Italy is

SCHOOLS OF PAINTING

Meaning
of
"school."

THE word "school" as applied to painting¹ is used with various more or less comprehensive meanings. In its widest sense it includes all the painters of one country, of every date,—as, for example, "the Italian school." In its narrowest sense it denotes a group of painters who all worked under the influence of one man,—as, for example, "the school of Raphael." In a third sense it is applied to the painters of one city or province who for successive generations worked under some common local influence, and with some general similarity in design, colour, or technique,—as, for example, "the Florentine school," "the Umbrian school." In a fourth sense it is applied to well-defined schools of painting is now almost wholly a thing of the past, and the conditions under which the modern artist gains his education, finds his patrons, and carries out his work have little in common with those which were prevalent throughout the Middle Ages. Painters in the old times were closely bound together as fellow-members of a painters' guild, with its clearly defined set of rules and traditions; moreover, the universal system of apprenticeship, which compelled the young painter to work for a term of years in the *bottega* or studio of some established freeman of the guild, frequently caused the impress of the genius of one man to be very clearly stamped on a large number of pupils, who thus all picked up and frequently retained for life certain tricks of manner or peculiarities of method which often make it difficult to distinguish the authorship of a special painting.² The strong similarity which often runs through the productions of several artists who had been fellow-pupils under the same master was largely increased by the fact that most popular painters, such as Botticelli or Perugino, turned out from their *botteghe* many pictures to which the master himself contributed little beyond the general design,—the actual execution being in part or even wholly the work of pupils or paid assistants. It was not beneath the dignity of a great painter to turn out works at different scales of prices to suit rich or poor, varying from the well-paid-for altarpiece given by some wealthy donor, which the master would paint wholly with his own hand, down to the humble bit of decorative work for the sides of a wedding *cassone*, which would be left entirely to the 'prentice hand of a pupil. In other cases the heads only in a picture would be by the master himself or possibly the whole of the principal figures, the background and accessories being left to assistants. The buyer sometimes stipulated in a carefully drawn up contract that the cartoon or design should be wholly the work of the master, and that he should himself transfer it on to the wall or panel. It will thus be seen how impossible it is always to decide whether a picture should be classed as a piece of *bottega* work or as a genuine production of a noted master; and this will explain the strange inequality of execution which is so striking in many of the works of the old masters, especially the Italians. Among the early Flemish and Dutch painters this method of painting does not appear to have been so largely practised, probably because they considered minute perfection of workmanship to be of paramount importance.

1. *Italian.*

In Italy, as in other parts of Europe, the Byzantine school of painting was for many centuries universally prevalent,³ and it was not till quite the end of the 13th

century that one man of extraordinary talent—Giotto—broke through the long-established traditions and inaugurated the true Renaissance of this art. According to Vasari, it was Cimabue who first ceased to work in the Byzantine manner; but the truth is that his pictures, though certainly superior to those of his predecessors, are thoroughly characteristic specimens of the Byzantine style. Ghiberti, in his *Commentary* (a century earlier than Vasari's work), with greater accuracy remarks that both Duccio of Siena and Cimabue worked in the Byzantine manner, and that Giotto was the first who learnt to paint with naturalistic truth.

In the 12th and the early part of the 13th century Pisa, Lucca and Lucca were the chief seats of what rude painting then ex-

isted in Italy. A number of works of this date still exist, chiefly painted Crucifixions treated in the most conventional Byzantine manner. Giunta Pisano, who was painting in the first half of the 13th century, was a little superior to the otherwise dead level of hieratic conventionalism. He is said to have been Cimabue's master. In the 14th century painting in Pisa was either Florentine or Sienese in style.

No city, not even Florence, was so fertile as Siena in native painters during the 13th and 14th centuries. The earliest, working before 1300,

did not emancipate themselves from the old Byzantine mannerism; Guido da Siena, Duccio (see fig. 1) and Segna di Buoninsegna possessed many of the peculiarities of the old school,—its rigid attitudes, its thin stiff folds, and its greenish shadows in the flesh tints. In the first half of the 14th century a number of very able painters were carrying on at Siena a parallel development to that which Giotto had inaugurated

FIG. 1.—Centre of a triptych, by Duccio di Buoninsegna,—the Madonna with Angels, and, above, David and six Prophets. (National Gallery, London.)

Siena.

Byzantine influence.

¹ For classical painting, see ARCHOLOGY, vol. ii. p. 348 sq.; see also FRESKO, MURAL DECORATION, TEMPERA, and the articles on separate painters.

² This is especially the case with the numerous pupils of Perugino.

³ See MURAL DECORATION, vol. xvii. p. 43 sq.

at Florence; chief among them were Simone di Martino, Lippo Memmi, and especially Ambrogio Lorenzetti, a

FIG. 3.—Fresco in the church of Santa Croce, Florence, by Giotto—the Disciples of St Francis discovering the Stigmata on his Body.

painter of both panels and large frescos, which show rich and noble imaginative power and much technical skill. It is important to note that Ambrogio and probably other painters of his time were, like the earlier Pisan Niccola, beginning to study the then rare examples of classical sculpture. Ghiberti, in his *Commentary*, speaks with enthusiasm of the beauty of an antique statue which he knew only from a drawing by Ambrogio Lorenzetti. In the second half of the 14th century Siena produced a large

FIG. 5.—Picture on canvas in the Uffizi, Florence, by Botticelli—the Birth of Venus.

number of more mediocre painters; but these were succeeded by an abler generation, among whom the chief were

FIG. 6.—The Annunciation, by Lippo Lippi. (National Gallery.)

perhaps Sano di Pietro and Matteo di Giovanni, whose grand altarpiece (No. 1155), recently acquired, is one of

the glories of the English National Gallery. Many excellent masters were working at Siena throughout the 15th century and even later; the last names of any real note are those of Peruzzi and Beccafumi. Sodoma, though he settled in Siena in 1501, does not belong to the school of Siena; his early life was passed at Milan, chiefly under the influence of Da Vinci. His talent was developed at Rome among the followers of Raphael.

On the whole the Florentine school surpasses in importance all others throughout Italy. Cimabue, though he

FIG. 8.—The so-called School of Pao, by Signorelli, the most beautiful of his easel pictures. (Berlin Gallery.)

did not emancipate himself from the Byzantine manner, was a painter of real genius (see fig. 2).

Giotto is perhaps the most important painter in the history of the development of art, for during the whole of the 14th century the painters of Florence may be said to have been his pupils and imitators (see fig. 3). Orcagna alone developed rather a different line, more richly decorative in style and brighter in colour,—a link between the art of Giotto and that of Siena. In the 15th century Flo-

FIG. 9.—Fresco of Isaiah, by Michelangelo, once reached its period of highest artistic splendour and developed an almost

from the vault of the Sistine Chapel.

naturalistic school, which appears to have been inaugurated by Masolino and Masaccio. Some few painters, such as Fra Angelico (see fig. 4) and his pupil Benozzo Gozzoli, produced more purely sacred and decorative work, following the lead of Orcagna. As Baron Rumohr has pointed out, the main bulk of the Florentine 15th-century painters may be divided into three groups with different characteristics. The first, including Masolino, Masaccio, Lippo Lippi, Botticelli, Filippino Lippi, and their pupils, aimed especially at strong action, dramatic force, and passionate expression (see figs. 5 and 6). The second, including Baldovinetti, Rosselli, Ghirlandaio, and his pupils, are remarkable for realistic truth and vigorous individuality (see fig. 7). To the third belong Ghiberti, who began life as a painter, Pollaiuolo,¹ Verrocchio, and his pupils Leonardo da Vinci and Lorenzo di Credi, — a group largely influenced by the practice of the arts of the goldsmith and the sculptor. Signorelli, whose chief works are at Orvieto and Monte Oliveto near Siena, was remarkable for his knowledge and masterly treatment of the nude (see fig. 8), and had much influence on the early development of Michelangelo, whose gigantic genius in later life produced the most original and powerful works that the modern world has seen (see fig. 9). Andrea del Sarto was one of the last artists of the golden age of painting in Florence; the soft beauty of his works is, however, often marred by a monotonous mannerism. To him are wrongly attributed many paintings by Fuligo and other scholars,

FIG. 10.—Baptism of Christ, by Piero della Francesca. (National Gallery.)

FIG. 11.—The Adoration of the Shepherds, by Lorenzo di Lorenzo. (Gallery at Perugia.)

who imitated his style with various degrees of closeness. The 16th century in Florence was a period of the most rapid decline and was for long chiefly remarkable for its feeble caricatures of Michelangelo's inimitable style.

Umbria. Between the end of the 14th and the beginning of the

¹ It is interesting to note how Ant. Pollaiuolo's fine figure of St Sebastian in the National Gallery (London) resembles the statue of the same saint in Lucca cathedral by Matteo Civitate.

16th century the Umbrian school produced many painters of great importance grouped around a number of different centres, such as Gubbio, where Ottaviano Nelli lived; San Severino, with its two Lorenzos; Fabriano, famed for its able masters Allegretto Nuzi and Gentile da Fabriano; Foligno, whence Niccolò took his name; and above all Borgo San Sepolcro, where Piero della Francesca was born. Piero was one of the most charming of all painters for his delicate modelling, tender colour, and beauty of expression (see fig. 10). His masterpiece, a large altar-painting of the Madonna enthroned, with standing saints at the side and in front kneeling portrait of Duke Federico da Montefeltro, in the Brera gallery,

FIG. 12.—Centre of triptych, by Perugino, painted for the Certosa near Pavia. (National Gallery.)

FIG. 13.—The Madonna between St John Baptist and St Mary Magdalene, by Andrea Mantegna, on canvas. (National Gallery.)

is, strange to say, attributed to his pupil Fra Carnevale.²

² The attribution of this magnificent picture to Fra Carnevale rests wholly on a statement, evidently erroneous, of Pungiliotti; and hence many other works by Piero, such as the St Michael in the National Gallery, are wrongly given to Carnevale. It is doubtful whether any genuine picture by the latter is now known; if the Brera picture were really by him he would not only be greater than his master Piero, but would be one of the chief painters of the 15th century.

Gentile da Fabriano worked in the purely religious and richly decorative style that characterized Fra Angelico at Perugia. Fiorenzo di Lorenzo (see fig. 11) and Bonfigli prepared the way for Perugino (see fig. 12) and his pupils Pinturicchio, Raphael, Lo Spagna, and others. Timoteo Viti was another Umbrian painter of great ability, whose portrait by Raphael in black and red chalk is one of the most beautiful of the drawings in the Print Room of the British Museum.

Padua.

The Paduan school is chiefly remarkable for the great name of Andrea Mantegna, the pupil of Squarcione; his firm and sculpturesque drawing is combined with great beauty of colour and vigorous expression (see fig. 13). His pupil Montagna also studied under Gian. Bellini at Venice. Andrea Mantegna influenced and was influenced by the Venetian school; to him are attributed many of the early paintings of his brother-in-law Gian. Bellini, such as the Vatican *Pieta*, and other works more remarkable for vigour than for grace.

Arezzo.

The school of Arezzo was early in its development. Margaritone, who is absurdly overpraised by his fellow-townsmen Vasari, was an artist of the most feeble abilities. In the 14th century Arezzo produced such painters as Spinello di Luca, Niccolò di Gerini, and Lorenzo di Bicci. In the 15th century it possessed no native school worth recording.

Venice.

Venice did not come into prominence till the 15th century; the Vivarini family of Murano were at work about the middle of it, and were perhaps influenced by the German style of a contemporary painter from Cologne, known as Johannes Alemanus, who had settled in Venice. Some years later the technical methods of Flanders were introduced by Antonello of Messina, who is said to have learnt the secret of an oil medium from the Van Eycks.¹ Crivelli, an able though mannered painter of the second half of the 15th century, adhered to an earlier type than his contemporaries (see fig. 14). Gian. Bellini is one of the chief glories of

the Venetian school (see fig. 15); as are also in a secondary degree his brother Gentile and his pupil Vittore

FIG. 14.—So-called Sacred and Profane Love, by Titian. (Borghese Gallery, Rome.)

Carpaccio.² In the following century Venice possessed a school which for glory of colour and technical power has

never been rivalled, though it soon lost the sweet religious sentiment of the earlier Venetians. The chief names of this epoch are Palma Vecchio, Giorgione, Titian (see fig. 16), and Lorenzo Lotto, —the last a magnificent portrait painter, a branch of art in which Venice occupied the highest rank. In the 16th century Tintoretto and Paul Veronese were supreme (see fig. 17). In the 17th and 18th centuries Venice produced some fairly good

FIG. 17.—Various saints, by Paul Veronese. (Bresc. Gallery, Milan.)

work.

The Brescian school has bequeathed two very illustrious names, —Moretto and his pupil Moroni, both portrait painters of extraordinary power during the 16th century (see fig. 18). Moretto also painted some fine large altar-pieces, remarkable for their delicate silver-grey tones and refined modelling. Romanino was an extremely able painter of frescos as well as of easel pictures.

The school of Verona, which existed from the 13th to the 17th century, contains few names of highest importance; except that of Pisanello, the chief were painters of the

FIG. 18.—Portrait of a Tailor, by Moroni. (National Gallery.)

end of the 15th and the early part of the 16th century, as Domenico and Francesco Morone, Bonsignori, Girolamo dai Libri, and Cavaz-

¹ Antonello certainly possessed technical knowledge beyond that of his contemporaries in Venice, namely, that of glazing in transparent oil colours over a tempera ground, and he must either in Italy or in Flanders have come in contact with some painter of the Flemish school; many of the chief Flemish painters visited Italy in the 15th century.

² It should be noted that there are a large number of forged signatures of Gian. Bellini, many of them attached to their own pictures by his pupils, such as Catena and Rondinelli.

zola. Paul Veronese, though at first he painted in his native town, soon attached himself to the Venetian school.

Ferrara. Ferrara possessed a small native school in the 15th and 16th centuries, Cosimo Tura, Ercolo Grandi, Dosso Dossi, and Garofalo being among the chief artists. The paintings of this school are often vigorous in drawing, but rather mannered, and usually somewhat hard in colour. After

FIG. 19.—Pieta, by Francia. (National Gallery.)

1470 there was an intimate connexion between the schools of Ferrara and Bologna.

Bologna. The Bologna school existed, though not in a very characteristic form, in the 14th century. Francia and Lorenzo Costa of Ferrara were its chief painters at the end of the 15th century (see fig. 19). It was, however, in the 16th and 17th centuries that Bologna took a leading place as a school of Italian painting, the beginning of which dates from about 1480, when several able painters from Ferrara settled in Bologna. The three Caracci, Guido (see fig. 20), Domenichino, and Guercino were the most admired painters of their time, and continued to be esteemed far beyond their real value till about the middle of the 19th century. Since then, however, the strong reaction in favour of earlier art has gone to the other extreme, and the real merits of the Bolognese school, such as their

FIG. 20.—Ecce Homo, by Guido. (National Gallery.)

powerful drawing and skilful though visibly scholastic composition, are now usually overlooked.

Both Modena and Parma possessed mediocre painters in the 14th and 15th centuries. In the 16th Correggio and his pupil Parmigiano attained to a very high degree of popularity. Correggio, who was largely influenced by the Ferrara-Bologna school, is sometimes weak in drawing and affected in composition, but will always be esteemed for the rich softness of his modelling and the delicate Fig. 21.—The Education of Cupid, by Correggio. (National Gallery.)

tints. Fig. 21 is an excellent example of his style, though much injured by repainting.

The small school of Cremona occupies only a subordinate position. Boccacino was its ablest painter; his rare works are remarkable for conscientious finish, combined with some provincial mannerism.

In the 15th and early part of the 16th century Milan Milan had one of the most important schools in Italy.

Its first member of any note was Vincenzo Foppa, who was painting in 1457 and was the founder of the early school. Ambrogio Borgognone (born c. 1455) was an artist of great merit and strong religious sentiment. He followed in the footsteps of Foppa, and his pictures are remarkable for the calm beauty of the faces, and for their delicate colour (see fig. 22), which recalls the manner of Piero della Francesca. Leonardo da Vinci, though trained in Florence, may be said to have created the later Milanese school.

FIG. 22.—The Mystic Marriage of St Catherine of Alexandria and St Catherine of Siena to Christ, by Ambrogio Borgognone. (National Gallery.)

Fig. 23 shows one of the very few pictures by his hand which still exist. The marvellous and almost universal

genius of Leonardo caused his influence to be powerfully extended, not only among his immediate pupils, but also among almost all the Lombard painters of his own and the succeeding generation. His closest followers were Salaino, Luini, Cesare da Sesto, Beltraccio, and Marco d'Oggiono, and in a lesser degree Andrea Solaro, Gandenzio Ferrari, and Sodoma, who introduced a new style of painting into

FIG. 23.—The Madonna with the Rocks, by Leonardo da Vinci. (National Gallery.)

Siena. Solaro also studied in Flanders, and in Venice under Gian Bellini, so that a curiously composite style is visible in some of his magnificent portraits (see fig. 24). Most of the pictures and many drawings usually attributed to Da Vinci are really the work of his pupils and imitators. Luini, in his magnificent frescoes, was one of the last painters who preserved the religious dignity and simplicity of the older mediæval schools. Fresco painting was practised by the Milanese after it had been generally abandoned elsewhere.

Rome. Rome has always been remarkable for its absence of native talent in any of the fine arts, and nearly all the members of the so-called Roman school came from other cities. This school at first consisted of the personal pupils of Raphael,—Fran. Penni, Da Imola, Giulio Romano, and Del Yaga. Sassoferrato and Carlo Maratta were feeble but very popular painters in the 17th century.

Naples. The early history of the Neapolitan school is mostly mythical; it had no individual existence till the 16th century, and then chiefly in the person of Caravaggio. During the 15th century many works of the Van Eycks and other Flemish painters were imported into Naples; some of these were afterwards claimed by the vanity of native writers as paintings by early Neapolitan artists, for whom imaginary names and histories were invented. The Spaniard Ribera, Salvator Rosa, and Giordano were its chief members in the 17th century.

2. German.

German school.

It was especially at Cologne in Westphalia and in the Rhine provinces generally that German painting was developed at an early time. William of Cologne, who died about 1378, painted panels with much delicacy and richness of colour (see fig. 25). A number of large and highly finished altarpieces were painted in this part of Germany during the 15th century, but the names of very few of the painters of that time are known. Artists such as Schongauer, Von Meckenen, Cranach, and others were more at home in the engraving of copper and wood than in painting, and to some extent the same might be said of Albert Dürer, an artist of the highest and most varied talents, who especially excelled as a portrait painter (see fig. 26). The Hans Holbeins, father and son, especially the latter, attained the highest rank as portrait painters; nothing

can exceed the vivid truthfulness and exquisite workmanship of the portraits by the younger Holbein (see fig. 27), who also painted very beautiful religious pictures. Since his time Germany has produced few noteworthy painters. In the 19th century Overbeck was remarkable for an attempt to revive the long dead religious spirit in painting, and he attained much popularity, which, however, has now almost wholly died away.

3. Flemish.

Hubert and Jan van Eyck, who were Fig. 27.—Portrait of an Unknown Lady, by Holbein. (The Hague Gallery.)

painting at the beginning of the 15th century, were artists of the very highest rank; with their unrivalled technical skill, their exquisite finish, and the splendour of their colour, they produced works which in some respects even surpassed those of any of the Italian painters. Probably no other artists ever lavished time and patient labour quite to the same extent to which Jan van Eyck did upon some of his works, such as the Arnolfini and Fig. 28.—Portrait, by Jan van Eyck; 1433. (National Gallery.)

other portraits in the National Gallery (see fig. 28), and the Madonna with the

The Van Eycks and their school.

FIG. 29.—The Entombment of Christ, by Jan van Eyck the elder, painted in tempera on unprimed linen. (National Gallery.)

knelling Donor in the Louvre. This last is one of the

loveliest pictures in the world, both as a figure painting and from its exquisite miniature landscape and town in the distance, all glowing with the warm light of the setting sun. The elder Van der Weyden was a most able pupil of the Van Eycks; he occasionally practised a very different technical method from that usually employed in Flanders,—that is to say, he painted in pure tempera colours on unprimed linen, the flesh tints especially being laid on extremely thin, so that the texture of the linen remains unhidden. Other colours, such as a smalto blue used for draperies, are applied in greater body, and the whole is left uncovered by any varnish. A very perfect example of this exists in the National Gallery (see fig. 29). The special method used

with such success by the Van Eycks and their school was to paint the whole picture carefully in tempera and then to glaze it over in transparent oil colours; the use of oil as a medium was common in the 13th century and even earlier (see *MURAL DECORATION*). To the school of the Van Eycks belong a number of other very talented painters, who inherited much of their mar-

vellous delicacy of finish and richness of colour; the chief of these were Memling, Van der Meire, and the younger Van der Weyden, to whom is attributed No. 654 in the National Gallery (see fig. 30). The colour of this lovely picture is magnificent beyond all description. Quintin Matsys (Massys) and Gheerardt David also produced works of great beauty and extraordinary finished execution.²

At the beginning of the 16th century Flemish art began to lose rapidly in vigour, a weaker style being substituted under the influence of Italy. To this period belong Mabuse, Van Orley, and Patinir, who appear to have been special admirers of Raphael's latest manner. In the latter half of the century Antonij Mor, usually known as Antonio Moro, was a portrait painter of the very highest rank. A por-

FIG. 30.—St. Mary Magdalene, attributed to the younger Van der Weyden. (National Gallery.)

FIG. 31.—Portrait by Rubens, known as the "Chapeau de Paille." (National Gallery.)

¹ Elaborate directions for painting in oil are given by the German monk Theophilus (*Sched. dic. art.*, i. 37, 38), who wrote in the 12th century.

² Though the elder Van der Weyden and other Flemish painters of his time visited Italy, the Italian style of painting appears to have had very little influence on their vigorous work. The weaker Flemish painters of the 15th century, on the contrary, were close imitators of the Italians and produced pictures of a rather feebly pretty type.

trait of Queen Mary of England at Madrid, and one of a youth of the Farnese family at Parma, are real masterpieces of portraiture. He spent some time in England. The Breughel family in the 16th and 17th centuries produced feeble works finished with microscopic detail. Rubens and his pupil Vandyck in the 17th century were among the greatest portrait painters the world has ever seen (see figs. 31 and 32), and had many able followers on the Continent and in England. The portraits of Cornelius Van der Geest, by Vandyck or Rubens. (National Gallery.) land.

FIG. 32.—Portrait of Cornelius Van der Geest, by Vandyck or Rubens. (National Gallery.)

4. Dutch.

This school was chiefly remarkable for its painters of Dutch *genre* subjects, often treated with a very ignoble realism, school, especially by the various members of the Teniers family. Rembrandt, the greatest painter of the school, developed a quite original style, remarkable for the force shown in his effective treatment of light and shade.

The vigorous life and technical skill shown in some of his portraits have never been surpassed (see fig. 33). As a rule, however, he cared but little for colour, and used the etching needle with special enjoyment and dexterity. Terburg, Gerhard Dou (Dou), and Wouwerman had more sense of beauty, and worked with the most miniature-like delicacy. Another school excelled in landscape, especially Ruysdael and Hobbema (see figs. 34 and 35). Vandevelde was remarkable for

FIG. 33.—Portrait of an Old Woman, by Rembrandt. (National Gallery.)

FIG. 34.—Landscape, by Ruysdael. (National Gallery.)

his sea-pieces, and Paul Potter for quiet pastoral scenes with exquisitely painted cattle. Throughout the 17th

century the painters of the Dutch school far outnumbered

FIG. 35.—View of Middelhamnis in Holland, by Hobbema. (National Gallery.)

those of any other, and many of them reached a very fair average of skill.

5. Spanish.

Spanish school.

The early Spanish painters of the 15th and 16th centuries were merely feeble imitators of Italian art. Many of them, such as Juan de Juanes, studied in Italy. Ribalta and Zurbaran were perhaps the first able artists who developed a national style. The latter is remarkable for his paintings of monks; fig. 36 shows one of the best examples. His large altarpieces are less successful.

Velazquez, one of the greatest masters of skilful execution the world has seen, was alike great in portraiture (see fig. 37) and in large figure subjects. His early religious paintings, executed under the influence of Ribalta, are far inferior to his later works, the best of which are at Madrid. Murillo is usually rather undervalued; he was very unequal in his work, and is well represented nowhere except at Seville. No words can describe the exquisite religious beauty and pathos of his great picture of Christ on the Cross bending down to embrace St Francis. Goya, who lived into the

FIG. 36.—Francisco Priar, by Zurbaran. (National Gallery.)

FIG. 37.—Portrait of Philip IV. of Spain, by Velazquez. (National Gallery.)

19th century, was an artist of great power, haunted by a hideous imagination. Fortuny, a very clever young painter, who died in Rome in 1874, was remarkable for his daring use of the most brilliant colour, with which his pictures are studded like a mosaic. His success has caused him to have countless imitators, most of whom reproduce the faults rather than the merits of his work. His influence on modern Continental art has been very great.

6. French.

French art, like that of Spain, was almost wholly under French Italian influence during the 15th and 16th centuries, school. Nicolas Poussin, in the 17th century, was the first to develop a native style, though he was much influenced by Titian. His best works are bacchanalian scenes, of which one of the finest is in the National Gallery (see fig. 38).

FIG. 38.—Bacchanalian Scene, by Nicolas Poussin. (National Gallery.)

When at his best his flesh painting resembles that of Titian, but it is frequently marred by unpleasant hot colouring. Claude Lorrain is remarkable for his beautiful and imaginative landscapes,—often wanting in a real study of nature (see fig. 39). His finest works are in

FIG. 39.—Landscape, by Claude Lorrain. (National Gallery.)

England (see p. 445). Throughout the 18th century the French school was very prolific, but shared the mediocrity of the age, the corruption and artificiality of which impressed themselves strongly on the painting of the time. The most popular artists of that century were Watteau, Boucher, Greuze, Claude Vernet, Fragonard, and David, the reviver of the pseudo-classic style. In the first half of the 19th century Prud'hon, Ingres, Horace Vernet, and Delaroche—artists of only moderate merit—were in great repute, and more deservedly the very brilliant landscape painter Rousseau. Millet, though little valued during his lifetime, is now highly appreciated. Regnault, a very able

painter, who while yet young was killed at the siege of Paris in 1871, belongs to the latest development of French art. At present (1886) Paris possesses by far the most important school of art existing, and French painters on the whole are supreme in power of drawing and in technical skill. Unhappily these great merits are often counterbalanced by false sentimentalism or excessive realism, and especially by gross sensuality. Art in France—that is, in Paris—is now in a state of the most prolific activity, and is branching out into new and startling phases, such as the impressionist style, in which *form* is suppressed for the sake of *colour*, and the naturalist school, which leans rather to what is ugly or even loathsome; to the latter belong some of the technically ablest painters alive.¹ As in Spain and Italy, the influence of Fortuny is strong in Paris, and Parisian influence now extends very widely, as the École des Beaux-Arts is resorted to by art students from all countries except Germany.

7. British.

The modern British² school begins with the painters of miniature portraits in the 16th and 17th centuries, among whom the earliest were Nicholas Hilliard and Isaac Oliver, artists of some note in the reign of Elizabeth. Many very beautiful miniatures were produced by them and by the younger Peter Oliver, who rose into celebrity under the Commonwealth. Other able portrait painters of the 17th century were the Scotch Jamesone, a pupil of Rubens, William Dobson, a pupil of Vandyck,³ and Samuel Cooper; but the chief court painters after the Restoration were the Flemish Sir Peter Lely and Sir Godfrey Kneller, whose influence on art in England was disastrous. The 18th century produced many painters of the highest merit, as Hogarth, who stands unrivalled as a caricaturist and moralist, Reynolds and his rival Gainsborough, notable among the chief portrait painters of the world (see figs. 40 and

FIG. 40.—Portrait of Dr. Johnson, by Reynolds. (National Gallery. A replica of this exists in Pembroke College, Oxford.)

FIG. 41.—Portrait of Mrs. Siddons, by Gainsborough. (National Gallery.)

¹ A few years ago a gold medal was won at the Salon by a picture of this class, a real masterpiece of technical skill. It represented Job as an emaciated old man covered with ulcers, carefully studied in the Paris hospitals for skin diseases.

² For mediæval painting in England, see *MURAL DECORATION*, vol. vii. p. 45.

³ Vandyck lived and worked in England from 1632 to 1641.

41), and Richard Wilson, the founder of the English school of landscape, the chief artistic speciality of the country. The three brothers Smith of Chichester, Gainsborough, and later in the century John (Old) Crome of Norwich and James Ward, were all landscape painters of great ability. England has since the 18th century been specially famed for its school of water-colour painters, of which Paul Sandby was one of the founders; he was followed by Wheatley, Webber, Girtin, and Prout. Sir Henry Raeburn was a Scottish portrait painter of the highest rank

(see fig. 42), but Fig. 42.—Portrait of Rev. Arch. Alison, by Sir was far less ad- H. Raeburn. (National Portrait Gallery.) mired in England than the very feeble Lawrence. Little can be said in favour of many of the most popular

FIG. 43.—The Temeraire towed to her last moorings, by Turner. (National Gallery.)

painters of that time, as West, Barry, Fuseli, Northcote, and Shee, who practised what was considered the highest branches of art, such as historical painting. William Blake, in spite of his wonderful poetical and imaginative power, lived and died with very inadequate recognition. To the first half of the 19th century belong Turner, the greatest of all landscape painters (see fig. 43), and his very able contemporaries Constable, J. J. Chalon, Copley Fielding, and Stan-

FIG. 44.—Portrait, by Dante Gabriel Rossetti.

field Scotland produced two of the chief painters of this time—Sir William Allan and Sir David Wilkie. Mulready was a fine draughtsman, skilful in composition, but weak in colour. Etty's scholastic drawing recalls the merits and faults of the Bolognese school, and he is frequently very fine in colour. Eastlake was weak in drawing and feeble in composition. Sir Edwin Landseer excelled in animal painting, especially in his rendering of the texture of hair and fur, but was frequently rather laish in colour and commonplace in motive. David Roberts is worthy of note for his very clever water-colours of architectural scenes, J. F. Lewis for his ex-

quisitely finished Oriental subjects, and J. S. Raven for his grand and imaginative landscapes, which, however, are very little known. Dante Gabriel Rossetti (see fig. 44), who died in 1882, was one of the chief painters of the century, both for the richness of his colouring and for his strong poetical imagination, he was one of the founders of the Pre-Raphaelite "brotherhood" (see ROSSETTI), whose rise, development, and widespread influence on painting in Britain have been the chief artistic events in this century, and have produced a few painters whose earnestness of purpose and originality of power give them a foremost and absolutely unique position in modern Europe.

LIST OF PAINTERS

The following lists give the chief painters classified according to their schools in chronological order.*

1. Italian Schools¹(i) *Lucca and Pisa.*

Lottarino and Raimondo of Lucca, known only from a document, a treaty with Pisa, signed by them in 1258.
Bonaventura Berlinghieri,² fl. 1235-44.
Erasmo di Pisa, miniature, fl. 1238.
Marco Berlinghieri, miniature in a MS Bible, 1250.
Barone Berlinghieri, several crucifixes, fl. 1240-84.
Daddato Orlandi of Lucca, fl. 1288-1301.
Gineto Pisano, first half of 13th century.
Tornito Vanni, second half of 14th century.
The names of many other Pisan painters of the later part of the 13th century are recorded in documents, but no paintings by them are known to exist.

(ii) *Sienna.*

Guido da Siena, fl. 1220.
Dottino, fl. 1270.
Duccio di Buoninsegna, fl. 1280.
Simone di Buoninsegna, fl. 1305.
Sergio di Martino, fl. 1285-1344.
Lippo Memmi, fl. 1347.
Berni, fl. early 14th century.
Pietro Lorenzetti, fl. 1320-1348.
Ambrogio Lorenzetti, Pietro's brother, fl. 1330, a. c. 1348.
Niccolo di Segna, fl. 1342.
Jacopo di Mino, fl. 1342.
Lippo Vanni, fl. 1350-1375.
Niccolo di Buonaccorso, fl. 1380-88.
Bartolo di Fredi, fl. 1368-1413.
Luca di Tomme, fl. 1367.
Paolo di Giovanni, fl. 1380.
Meo da Siena, fl. 1380.
Guido di Bartolo, 1388-1422.
Andrea di Bartolo, 1380-1428.
Gregorio Cecchi, fl. 1400.
Martino di Bartolomeo, fl. 1403, fl. 1418.
Donato di Bartolo, fl. 1440.
Stefano di Gino, fl. 1428, fl. 1450.
Giovanni di Paolo, fl. 1408-1422.
Sano di Pietro, 1408-81.
Lorenzo di Pietro (Vespignetta), 1410-50, better known as a sculptor.
Matteo di Giovanni, 1420-85.
Benvenuto di Giovanni, 1430-1518.
Francesco di Giorgio, fl. 1439.
Neroccio di Landi, 1447-1500.
Pietro di Donato, 1460-1501.
Bernardino Pungili, 1460-1512.
Andrea di Niccolo, 1460-1520.
Giovanni di Benvenuto, 1470-1524.
Gasparo Pacherotus,³ fl. 1474.
Giurolamo del Pacchia,⁴ 1477 to after 1521.

* When the years of a painter's birth and death are unknown, it is for "about" (shied) is put before the date, which is taken either from existing dated pictures or from documentary records.
† Of recent years a more careful search for documents relating to Italian art has done much to correct the dates of many painters' lives. Hence in many cases the years of a painter's birth and death given in the following list differ from those in most previous works on the subject.

* The three Berlinghieri were of a Luccan family, but worked mostly at Lucca.

* Most valuable assistance in the preparation of this list of Siennese painters was given by Mr O. Zaichax Murray.

* The works of these two painters are frequently confounded, a chronologi-

cal error. **Gov. Ant. Beati (Giotto),** 1477-1549, though not of the Siennese school, had much influence on the Siennese painters in the early part of the 16th century.
Baldassare Peruzzi, 1481-1557.
Donato Michelino (Beccafumi), 1480-99.
The most important Siennese painters during the second half of the 15th and the first centuries were Arezzo, Silvestro, Alessandro Casola, Pietro Savi, Ventura Salmanni, Francesco Vanni, Francesco Fausti, Bartolo Mastri, Astolfo Petrazzi, and Raffaele Vanni 6.

(iii) *Florence.*
Andrea del, 1430-84 (Vasari).
Corrado di Matteo, 1430-75.
Guido Gaddi, 1399-1432 (according to Vasari).
Giovanni Gualcheri (Ombra), 1340-1362.
Gottio di Bondone, 1376-1387.
Taddeo Gaddi, 1360 to after 1366.
Puccio Capanna, first half of 14th century.

Buonamico Christofani (Buonaccorso), first half of 14th century.
Agnolo Gaddi (son of Taddeo Gaddi), 14th century.
Andrea Orcagna, c. 1316-1376, and his brothers Leonardo? (fl. 1333-47) and Jacopo.

Francesco Traini, chief of Orcagna's pupils, fl. 1341-45.
Antonio Longhi (Veneziano), fl. 1370-87.
Gherardo Starnina, 1364, d. after 1406.
Giuliano d'Arrigo (Faiello), 1367 to after 1427.
Tommasso di Fim (Masolino), b. 1388.
Lorenzo Monaco, fl. 1404-13.
Fra Angelico (Guccio di Vicochio), 1387-1455.
Andrea del Castagno, 1360-1457.
Paolo Uccello, c. 1366-1475.
Tommasso di S. Giovanni (Masaccio), pupils, fl. 1421-45.
Pia Lippo Lippi, c. 1410-69.
Francesco del Pollaiuolo (Pollaiuolo), 1429-57.
Antonio Baldovino, fl. 1430-50.
Domenico Veneziano, fl. 1438, d. 1461.
Benozzo Gozzoli, 1424, d. after 1485.
Marcello Schiavone, 1434-1468.
Antonio Pollaiuolo, 1438-98.
Cosmo Rosselli, 1458-1467.
Andrea del Verrocchio, fl. 1470-1498.
Luca, his principal pupil, was Girolamo Genga, 1470-1561.

Pietro Pollaiuolo, 1445, b. before 1469.
Stefano di Stefano, 1447-1515.
Donato Girolandini (Girolandino), 1449-84. His works were closely imitated by his pupil and brother-in-law **Bastiano Mainardi.**
Lorenzo di Credi, 1459-1537. His chief scholar was **Segni, 1462-1544.**
Philippo Lippi, 1460-1504.
Piero di Cosimo, 1462-1502.
Stefanuccio di Stefano, 1460-1524.
Francesco Granacci, 1460-1543.
Giuliano Bugiardini, 1471-1554.
Marcello Albertini, 1474-1510.
Fra Bartolomeo della Porta, 1475-1527.

graph of a fresco by Pollaiuolo—a scene from the life of St Catherine—has been published by the Arnold-Boeckly as being from a work of Zuccherotto.

* See *Lavin, Painting in Italy*, Bonn's ed., vol. 1, p. 280.

* Wrongly called Bernardo by Vasari.

Michelangelo Buonarroti, 1475-1564.
Francesco di Cristofano (Francisco Bigio), 1482-1525.
Raffaello Ghirlandajo, 1483-1560.
Andrea del Sarto, 1487-1531. His scholar **Pupillo** closely imitated his style.
Jacopo Carucci da Pontorno, 1490-1557.

Giulio Clovio di Dalmata, miniature, fl. 1500-1578.
Angelo Bronzino, 1502-72.
Marcello Venusti, d. c. 1560.
Antonio da Tivoli, 1500-85.
Francesco de' Rossi (called Del Salviati), 1510-68.

Giorgio Vasari, art historian, 1511-74.
Alessandro Allori, 1525-1507.
Osasio Lotti de' Gherleschi, 1522-1640.
Cristoforo Allori, 1577-1621.
Carlo Dolce, 1616-88.
The other Florentine painters of the latter part of the 16th and 17th centuries are of little importance.

(iv) *Umbria.*
Oderisio di Gubbio, miniature, (Dante, 1345, vi, 79), fl. 1304-c. 1320.
Guido Fulminacci (Gubbio), 1380-c. 1345.

Allegretto Nuzzi, fl. 1340-83.
Gentile da Fabriano, b. between 1300 and 1370, d. 1410.
Ottaviano Nelli, fl. 1410-84.
Lorenzo da San Severo, b. 1374, fl. 1410-84.

Piero Borghese (Della Francesca), c. 1415 to after 1494.
Fra Giovanni, pupil of P. Borghese, second half of 14th century.
Benedetto Bonifigi, fl. 1420-96.
Niccolo di Poligno, fl. 1465-99.
Lorenzo da San Severo the younger, fl. 1450-90.

Matteo da Forlì, 1438-94.
Florentino di Lorenzo, fl. 1470-90.
Giuliano Spini (father of Raphael), pupil of Matteo da Forlì, fl. 1434.
Pietro Vannucci (Perugino), 1440-1534.
Bernardino di Bello (Pinturicchio), 1454-1513.

Marco Falegnaneri di Forlì, c. 1458, d. after 1537.
Andrea Alvogio (Tingegno), fl. 1484, d. 1490.
Lodovico Angeli, fl. 1481-1500.
Giuliano di Pietro (Lo Spagna), fl. 1508, b. in or before 1480.

Giannicola Manni, fl. 1495, d. 1544.
Tiziano Viti, 1493-1538.
Agostino Scilla, 1493-1520, belonged to the Perugia school only during the first few years of his career.

See important Umbrian painters of the 15th century were **Giov. Boccato, Giuliano di Giovanni, Matteo da Perugia, Francesco di Tommaso, and Pietro Antonio, also a number of third-rate painters who belonged to the school of Perugia.**

(v) *Padua.*
Guariento, fl. 1310-65.
Fra Giovanni (Gusto Giovanni), c. 1380-1400, apparently a follower of Giotto.

Francesco Squarcione, 1384-1474.
Gregorio Squarcione, second half of 14th century.
Antonio da Barbato, 1431-1490. His chief pupils were **his son Francesco (b. c. 1470, died after 1517), Carlo (called the Master of the St. George altarpiece), and Francesco Bonifazi.**

Giulio da Mantova, 1431-1490. His chief pupils were **his son Francesco (b. c. 1470, died after 1517), Carlo (called the Master of the St. George altarpiece), and Francesco Bonifazi.**

Wright called Bernardo by Vasari.

Batistone Montagna (fl. 1457, d. 1523), a pupil of Mantegna and Gian Bellini, founded a school at Vicenza, to which belonged Giovanni Squarcione and Bonifazio Montagna, the latter an able engraver.

(vi) *Arezzo.*
Margherita di Magnano? (according to Vasari), 1516-85.

Ricci di Lorenzo, d. c. 1305-10.
Jacopo di Casentino, c. 1410-c. 1490.
Spinello di Luca (Aretino), chief pupil of Casentino, fl. 1380-1410.
Niccolo di Pietro Gherini, d. before 1389. His son **Lorenzo** was also a painter.

Lorenzo di Bicci, fl. 1370-1409.
Piero Spinelli, early 15th century.
Ricci di Lorenzo, d. 1420, fl. 1420.
Bartolomeo della Gatta, c. 1410-91. His pupils **Donatello** and **Niccolo** Segni were men of but little talent.

(vii) *France.*
Niccolo Semacolo, fl. 1381-1400.
Lorenzo Veneziano, fl. 1387-79.
Stefano Veneziano, d. 1390-81.

Carlo di Stefano, fl. 1380-80.
Johannes Alenstans, probably of Cologne, fl. 1440-95.
Ysaie Bellini, 1365-1470, and his two sons—

Gentile Bellini (1421-1497) and Giovanni Bellini (1430-1516). Giovanni's closest imitator was **Niccolo Rondelli.**

Tommaso Vivarini, fl. 1440-70.
Antonio Vivarini, fl. 1440-70.
Batistone Vivarini, fl. 1460-80.
Alfano Vivarini, fl. 1460-1500.
Antonio da Messina, fl. 1444-1493.
Carlo Crivelli, fl. 1468 to after 1500.

Manet, fl. 1490-1500.
Vittore Carpaccio, c. 1450 to after 1522. His chief pupil was **Lazzaro Beldamini.**
Marco Mazzola, fl. 1490-1507.
Marco Basaiti, fl. 1470-1520.

Francesco Toledo (Moretto), 1496-1549.
Giulio Campi, fl. 1490-1531.
Onna da Conegliano, fl. 1498-1517.
Macchio d'Alba, fl. 1490-1508.
Giorgio Schiavone, fl. c. 1505-80.
Marco Belli, fl. 1511.

Francesco Risoldo, fl. 1500-88.
Giulio Campi, fl. 1500-88.
Andrea Previtali, fl. 1505, d. 1528.
Lorenzo Loti, c. 1470-1556.
Giorgio Barbacchi (Giovannetti), 1471-1521.

Tiziano Vecellio, 1477-1578.
Jacopo Palma (Vecellio), 1480-1558.
Giov. Ant. Licinio (Cordone), 1483-1559.
Sebastiano Luciani (Dei Fiambo), 1466-1540.

Girolamo da Treviso, 1497-1504.
Bonifazio. There were three painters of this name—**Bonifazio of Verona, d. 1540, another Veronese Bonifazio,**

Magaritano, a very bad painter, much overpraised by Vasari, belongs really to no special school, his works are inferior to contemporary and earlier paintings of the Byzantine School. The National Gallery possesses an ugly but interesting example of his work, "Margaret de Arto." Some other painters born at Arezzo belong to the Florentine school, among them **Giorgio Vasari, a very feeble imitator of Michelangelo.**

* These two painters belong rather to the Florentine school.

d 1533, both pupils of Palma Vecchio, and a Venetian, who was painting after 1575, probably a son of one of the elder Bonifazio.
Girolamo da Santacroce, fl. 1530-48.
Pans Bonifazio, 1505-57.
Jacopo da Ponte (Bassano), 1510-62.
Four of his sons were painters.
Jacopo Robusti (Michelangelo), 1512-94.
Bernardino da Pordenone, 1530-70.
Andrea Belfanti, 1523-82.
Paolo Cagnani (Veronese), 1528-68.
Battista Zelotti, fl. 1532-93.
Jacopo Palma (Giorgione), 1544-1628.
Alessandro Varotari (Padovano), 1560-1650.
Sebastiano Ross, 1560-1784.
Gov. Bart. Tiepolo, 1686-1770.
Antonio Canale (Cannetolo), 1667-1768.
Francesco Zuccherelli, 1702-93.
Francesco Guardi, 1733-98.
Bernardo Bellotto, 1730-80, nephew of Canaletto and a close imitator of his style.

(vii) Brescia

Vincenzo Foppa, fl. 1450-60 (see also Milan).
Vincenzo Civerchio di Crema, fl. 1405-1540.
Boravante Ferramola, end of 15th cent.
Girolamo Romanelli (Il Romanino), c. 1480-c. 1560.
Giovanni Savoldo, c. 1487 to after 1540.
Alessandro Benvenuto (Moretto), 1495-1708.
Gov. Batt. Moroni di Bergamo, c. 1525-78.

(v) Verona

Torre da Verona, fl. 1360.
Alcibero da Zevio and Gasparo degli Avanzi, 14th century. The other Veronese painters of the 14th century were of little artistic power.
Vittore Pisano (Pisanello), 1380-c. 1455.
His chief pupils were Stefano di Zevio, Giovanni Ortolano, and Bono di Ferrara (see Ferrara).
Domènico Morena, d. after 1503.
Liberale da Verona, 1461-1568.
Francesco Bonaguidi, 1468-1619.
Nicolo Goltino, c. 1485 to after 1518.
Francesco Morone, 1473-1629.
Giovanni dal Lupo, 1473-1629.
Paolo Morando (Cavazzola), 1489-1692.
Paolo Veronese and his imitator Battista Zelotti, a master of the school, belong rather to the Venetian school.

(vi) Ferrara

Cosimo Turra, 1480-1490.
Francesco Cosas, latter part of 15th century.
Bono da Ferrara, fl. 1461, pupil of Pisanello.
Francesco Bianchi, c. 1445-1510.
Ercolo Grandi (or Roberti), c. 1445, d. before 1518.
Giovanni Ortolano, fl. 1449 to after 1461, pupil of Pisanello.
Lorenzo Costa, 1460-1585, belongs rather to the Bolognese school.
Juan Battista Bortucci, c. 1506.
Dossio Dossio, 1480-1560. His brother Gianbattista was also a painter.
Lodovico Mazzolino da Ferrara, 1478-1580.
Francesco Mazzanella da Cotignola, fl. 1480-15, and then the Florentine.
Benvenuto Dusi (Grosvallo), 1483-1569.
Giovanni Battista Benvenuti (Ortolano), early part of 16th century.
Giovanni Carp, 1501-56.

(ix) Bologna

Guido da Bologna, fl. 1177.
Ventura, fl. 1197-1237.
Ursino, fl. 1238-48.
Viale da Bologna, fl. 1280-90.
Lippo Dalmasio, fl. 1370 to after 1410.
Simone (called de' Croci), fl. 1370.
Giovanni degli Avanzi, fl. later part of 14th century, also classed with Veronese school.
Jacopo di Paolo, early 15th century.
Marco Zoppo, fl. 1471-98.
Francesco Barbellotti (called Francia after his master), c. 1460-1537.
Lorenzo Costa di Ferrara, 1460-1585.
Francesco Franchetti, 1504-67.
Lodovico Carracci, 1555-1619.
Agostino Carracci, 1560-1801.
Annibale Carracci, 1560-1609.

1 As Comm. Morelli has pointed out, Grandi's signature and the date 1613 on a picture of the Bathshebam, formerly in the Borghese gallery in Rome, are a forgery. — Grandi really having died long before, it may, however, be by the younger painter of the same name.

2 See Mazzana, *Felicità Pittore*, Bologna, 1878.

Guido Reni, 1575-1642.
Francesco Albani, 1578-1660.
Domenico Zampieri (Donnaschino), 1581-1641.
Francesco Barbieri (Guercino), 1591-1666.
Giov. Cagnaccio, 1601-51.
Pier Fran. Mola, 1612-65.
Eusebio Vassari, 1614-65.

(vi) Modena ed Parma

Tommaso da Modena, fl. 1500-00.
Barnabò da Modena, fl. 1360-80.
Bartolomeo Grossi, fl. 1462.
Jacopo Leoni, fl. c. 1469.
Cristoforo Casali, fl. 1499.
Lodovico da Parma, pupil of Francia da Bologna, early 16th century.
Mazzola, three brothers, Michele, Pierluigi, and Filippo, early 16th century.
Antonio Allegri (Correggio), 1490-1584, closely connected with the Ferrara school.
Francesco Mazzola (Parmigiano), 1604-40. His pupil Girolamo Mazzola closely imitated his works.

(viii) Cremona

Francesco Testi, c. 1494-00.
Albino Meloni, fl. 1615-20.
Boccaccio Boccaccio, fl. 1496, d. 1635.
Giov. Campi, 1509-78.

(ix) Milan

Vincenzo Foppa, fl. 1450-60 (see also Brescia).
Giovanni Verdicchio, fl. 1480.
Vincenzo Overduyn (see Brescia), closely connected with early Milanese school.
Francesco Bianchi (Il Mac), 1447-1510.
Bernardo Zenale da Treviso, d. after 1521.
Leonardo da Vinci, 1452-1519. To his school belong Bernardino Lumini (d. 1470 to after 1520), Sodoma (1471-1549), Andrea da Solara (c. 1468 to after 1510), and more directly Giovanni Pietro, Ambrogio Pella, Cesare da Sesto (1460-1521), Marco d'Oggiono (1467-1489), Andrea Salama, and Gov. Ant. Beltramo (1467-1516).
Ambrogio da Pissano (Borgognone), c. 1450-1528. His two brothers were his pupils and assistants.
Bernardino Suardi (Bramantino) (fl. 1450-1520), and more directly Giovanni Guendino Ferrar (1435-1519) were also influenced by Leonardo.
Ferrari's chief pupils were:
Bernardino Lanini (c. 1508-c. 1578) and Gov. Paolo Manzoni, the Milanese.
A number of inferior Milanese painters lived in the 16th century.
Ercolo Procaccini, 1520-90.
Bernino Campi, 1522-90.
Camillo Procaccini, 1546-1626.
Gov. Batt. Crespi, 1567-1683.
A number of inferior Milanese painters lived in the 16th century.
Ercolo Procaccini, 1520-90.
Bernino Campi, 1522-90.
Camillo Procaccini, 1546-1626.
Gov. Batt. Crespi, 1567-1683.

(x) Rome

Raphael Sanzio, 1483-1520, who in his early youth belonged first to the Perugian school and then to the Florentine school, was the founder of the so-called Roman school, which at first to 1600 was wholly dependent on the Gov. Fran. Penni (Il Pastore), 1438-1528.
Innocenzo da Imola, 1490-1495.
Polidoro da Caravaggio, 1496-1458.
Giulio Pippi de' Giannuzzi (Romanino), 1498-1546.
Pierino del Vaso, 1500-47.
Felice Bardi, 1508-1612.
Cesare d'Arpino, 1507-1400.
Bartolomeo Schedoni, 1508-1615.
Gov. Lanfranco, 1581-1647.
Bart. Manfredi, 1581-1617.
Pietro da Cortona, 1594-1669.
Andrea Sacchi, 1598-1661.
Gianbattista Salvi (Sassoferrato), 1606-1685.
Carlo Maratti, 1625-1713.
Paolo Pannini, 1691-1765.

(xi) Naples

The names of Simone Napoletano, Colantonio, and other Italian painters who were supposed to have worked in the 14th and 15th centuries appear to be those of wholly mythical personages.
Michelangelo da Caravaggio, 1560-1609.
Giuseppe Ribera (Lo Spagnoletto), 1588-1652.
Aniello Falcone, 1594-1665.

3 See Lanzi, *Hist. of Painting*, Bohn's ed., t. p. 499 ff.

Salvator Rosa, 1615-72.
Luca Giordano, 1632-1705.

2. Gotha School

Wilhelm of Herle or William of Herle, fl. 1375-85.
Stephen Lochner, fl. 1414, d. 1451.
Master of Leubus, fl. 1405.
Hans Baldung Grien, 1484-1505.
Master of the Lyverberg Passion, fl. 1480-85.
Johann Mecklenke, c. 1490-1508.
Martin Schongauer, 1450-88.
Matthias Grunewald, c. 1460 to after 1520.
Master Christophorus, fl. 1500-10.
Master of the Death of the Virgin, fl. 1515, d. 1536.
Hans Holbein the Elder, c. 1460-1523, and his brother Sigismund Holbein, c. 1500 to after 1540.
Albrecht Dürer, 1471-1528.
Lucas Cranach, 1473-1551.
Hans Baldung Grien, 1484-1505.
Hans Füss (Von Künlichow), pupil of A. Dürer, d. c. 1522.
Albrecht Altdorfer, d. before 1480-1538.
Hans Leinhardt Schmalzer, 1490-1540.
Hans Holbein the younger, 1497-1546.
Hans Sebald Beham, 1500-50, and his brother Daniel Beham, 1500-50.
Heinrich Aldegrever, 1501-68.
Virgil Solis, 1514-62.
Lucas Cranach the younger, 1515-88.
Jost Amman, 1531-61.
Heinrich Goltz, 1558-1617.
Johann Rottenhammer, 1544-1629.
Adrian Elshagen, 1574-1630.
Christoph von Sarnitz, 1600-88.
Rudolph Demmer, 1608-174.
Johann Will Ernst Dietrich, 1712-74.
Anton Raphael Menges, 1728-78.
Peter von Cornelius, 1759-1807.
Johann Fried. Overbeck, 1739-1809.
Fried. Wilh. von Schadow, 1789-1862.
Julius Schnorr, 1794-1869.
Wilhelm von Kaulbach, 1805-74.
Karl Fried. Lessing, 1808-80.

3. Flemish School

Melchior Broeders, fl. 1388-c. 1400.
Hubert van Eyck, b. 1366, d. after 1420.
Jan van Eyck, the younger brother of Hubert, d. after 1440.
Margaret van Eyck, a younger sister of the above, died soon after Hubert.
Petrus Christus, a pupil of the Van Eycks, fl. 1440-71.
Dierckx pupils were:
Rogier van der Weiden the elder, c. 1400-64.
Gerrard van der Meire, c. 1410 to after 1474.
Hans Memling, c. 1430, d. before 1485.
Rogier van der Weiden the younger, c. 1450-1530.
Hugo van der Goe, fl. 1407, d. 1482.
Justus of Ghent, fl. 1461-70.
Gheert David, c. 1455-1523.
Quint Matsys, 1468-1511.
Jan Gossart of Maube, 1470-1582.
Bernard van Orley, 1470-1541.
Jan Mostert, 1474-1556.
Henri de Bles, 1480-c. 1550.
Joachim da Patinur, b. between 1468 and 1490, d. 1524.
Raspia, fl. 1480-1502.
Peter Paul Rubens, 1577-1680.
Franz Snyder, 1579-1607.
Kaspia, fl. 1582-99.
David Teniers, 1582-1490.
Jan (called "Velvet") Breughel, c. 1580-1625.
Jacob Jordaens, 1598-1678.
Lucas van Uden, 1595-1672.
Pieter de Keyser, 1598-1665.
Adriaan van Utrecht, 1599-1662.
Philippe de Champaigne, 1602-74.
Jan van Esen, 1606-65.
Jan Jyt, 1609-61.
David Teniers the younger, 1610-94.
Gerrard van der Meire, d. after 1664.
Gonzales Coques, 1614-84.
Pieter van der Paes (Sir Peter Lely), 1614-80.

4 Not 1480, as is usually supposed. Schongauer is mentioned by A. Dürer as being a young apprentice in 1470.
5 The Teniers, though Flemish by birth and education, belong more closely to the Dutch school.

Abraham Teniers, b. 1671.
Gerrard van Laere, 1641-1711.
Joh. Franc. Nijnt, 1643-69.
Cornelis Huyssmans, 1648-1727.
Jan van Bloemen, 1657-1740.
J. de Lame, master of Flemish painters, many of them pupils of Rubens, lived in the 17th century, but they are of little importance.

4. Dutch School

Albert van Ornat, early part of 15th century.
Gerrard van Haarlem, end of 15th century.
Hans Jansz van Aeken, c. 1460-1518.
Luis (called van der Vliet), 1494-1533.
Jan van Schrievel, 1495-1562.
Cornelis van Heemskerck (1498-1574).
Johannes van Haarlem (1500-1628).
Gerrard van Honthorst (1522-1600), though Dutch by birth, were feeble imitators of Italian schools.
Frans Hals, 1584-1666.
Thomas de Keyser, c. 1505-c. 1600.
Gerrard Janssen, c. 1500-1605.
Jan van Goyen, 1566-1636.
Jan de Heem, 1607-30.
Pieter G. 1607-30.
Rembrandt van Ryn or Ryn, 1600-69.
Emmanuel de Witte, 1607-62.
Jan W. 1607-62.
Gerrard Terburg, 1605-51.
Salomon Knauber, 1605-68.
Jas. Bach, c. 1610, and his younger brother Amias Bach, Adrian van Ostade, 1603-83.
Joh. Berthel. Weenix, 1621-60.
Bart van der Helst, 1613-70.
Gerrard Dou, 1613-76.
Jan Berthel. Weenix, 1621-60 to after 1691.
Philip de Koninck, 1619-80.
Philip Wouwerman, 1619-88.
Jas. Berthel. Weenix, 1621-60.
Isaac van Ostade, 1621-40.
Gerrard van der Eckhout, 1621-74.
Jas. Berthel. Weenix, 1621-60.
Paul Potter, 1625-54.
Jacob Ruyssdael, 1624-81.
Jas. Berthel. Weenix, 1621-60.
Karel Dujardin, 1608-78.
Gualter Meire, 1630 to after 1667.
Jas. Berthel. Weenix, 1621-60.
Nicholas Maes, 1623-98.
Pieter de Hooch, 1629-81.
Jas. Berthel. Weenix, 1621-60.
Willem Vanderelde the younger, 1638-1707.
Jas. Berthel. Weenix, 1621-60.

Jas. Berthel. Weenix, 1621-60.
Frans van Meers the elder, 1605-81.
His sons Jan and Willem were both painters.
Melchior de Hondecoeter, 1608-96.
Jan Hackaert, c. 1630-1740.
Jan van der Heyden, 1687-1712.
Mamest Hobbema, 1688-1700.
Adriaan Van derelde, 1689-75.
Gaspard Netscher, 1689-84.
Daniel Mytens the younger, c. 1644-c. 1688.
Jan Weenix, 1644-1710.
Jan van Huchtenburg, 1646-1788.
Van der Pae, 1647-704.
Art. van Meier, 1668-1744.
Jan van Huysum, 1682-1749.
Frans van Mieris the younger, 1680-1761.
Jan van Os, 1744-1808.
A large number of mostly third-rate painters lived in the 16th and 17th centuries.

5. Spanish School

Antonio del Rincon, 1446-1500.
Alonso Berruguete, 1460-1501.
Luis de Vargas, 1502-68.
Juan de Juanes (called Juanes), 1505-79.
His chief pupil was Bortas Luis de Morales, c. 1510-86.
Juan de B. 1510-86.
Gasper Becerra, 1520-70.
Francisco de Riballa, c. 1500-1628.
Juan de los Rios, 1500-1628.
Francisco Pacheco, 1571-1654.
Francisco de Herrera the elder, b. 1570, and his son known as Francisco II. 1620.
Eugenio Cordero, 1577-1642.
Juan de Riballa, 1578-1628.
Francisco Zurbarán, 1580-1662.
Diego Velazquez de Silva, 1590-1660.
Francisco Collantes, 1599-1656.
Juan de B. 1599-1656.
Alonso Cano, 1601-67.
Juan Carreño de Miranda, 1614-85.
Juan de Riballa, 1614-85.
Juan de Valdes, 1630-91.
Ciriaco Colacci, 1635-88.
Francisco G. 1748-83.
Mariano Fortuny, 1788-74.

a verge, with slight alterations it is the same in design as the *Puigel aux Roches* in the Louvre (see fig. 23). Leonardo's use of almost monochromatic colouring differs strongly from the style of his pupils and imitators. Luni, Andrea da Solano (see fig. 24), and Bellafra, all of whom are represented by excellent and characteristic examples. Of the earlier Milanese school the gallery contains two magnificent examples by Ambrogio Borgognone, — the Marriage of St. Catherine especially being a work of the highest importance and beauty (see fig. 22). The gallery possesses rare examples of the early German masters (see fig. 25, by William of Cologne), though it is weak in the works of the later Germans, as Albert Dürer, who is represented only by one portrait, which is signed (see fig. 26), and Hans Holbein the younger, who is not at all absent except for the noble portrait lent by the duke of Norfolk. The collection is, however, unusually rich in fine examples of early Flemish art, — of the Van Eyck and their school (see fig. 28). The portrait of Jean Arnolfini and his wife (signed and dated) is one of Jan van Eyck's noblest works on a small scale, — only surpassed, perhaps, by the Madonna and Worshipper in the Louvre. The Ennoblement of Christ by Van der Weyden the elder (see fig. 29), the three or more examples of Memling, the Ennoblement of St. Hubert by Durick Bouts, the Reading Magdalene by Van der Weyden the younger (see fig. 30), and the Saints and Donor by Gheerardt David are all unrivalled examples of these great painters. The delicate little panel of the Madonna by Margaret van Eyck is a work of much interest. The later Flemish and Dutch schools are equally well represented, especially by a number of noble portraits by Rembrandt (see fig. 33), Rubens, and Van Dyck; a portrait of an old woman, the "Chapeau de Poul," and the portrait of Van der Geest (wrongly called Gevarius) are among the finest works of these three masters (see figs. 31 and 32). Hobbema, Ruysdael, De Hooze, Wouverman, and others of their school are very richly represented (see figs. 34 and 35). Of the Spanish school the National Gallery contains an excellent portrait head of Philip IV. (see fig. 37) by Velazquez, a full-length of the same king, not wholly by his hand, and also two pictures of sacred subjects and a curious bear-hunting scene of much interest, but of inferior beauty. The examples of Murillo, like most out of Seville, are but third-rate specimens of his power. The Kneeling Friar as an example of Zurbarán's work is unrivalled either in Spain or out of it (see fig. 36). Among the pictures of the French school a number of fine landscapes by Claude Lorrain and a very masterly Bacchanalian scene by Nicolas Poussin are the most notable (see figs. 38 and 39). The English school is hardly represented in the north of the chief national collection, but it is supplemented, by a large number of fine paintings in the South Kensington Museum. The chief treasures in this branch possessed by the National Gallery are Hogarth's series of "Marriage à la Mode," some noble portraits by Reynolds and Gainsborough, and an unrivalled collection of Turner's works of all periods (see figs. 40, 41, and 42).

The royal gallery at Hampton Court (London), among a large number of inferior paintings, contains some of great value, especially the Baptism of Christ, an early work of Francia, a most magnificent portrait of Andrea Odom by Lor. Lotto, both signed, and a portrait of a youth attributed to Raphael. The chief treasure of the palace is the grand series of decorative paintings (nine in number) executed in tempera on canvas by Andrea Mantegna in 1485-92 for the duke of Mantua, but much injured by repainting. The equally celebrated cartoons designed by Raphael to decorate the Sistine Chapel are now moved to the South Kensington Museum. The gallery also possesses several fine examples of Tintoretto, many good Flemish and Dutch pictures, some small but fine examples of Holbein and his school, and a number of historically interesting works by English painters of the 17th century. The portrait of a Jewish Rabbi by Rembrandt is one of his finest works, — a perfect masterpiece of portraiture.

The Dutch school is especially rich in works of the Dutch school, and contains some noble portraits by Gainsborough and Reynolds, as well as an interesting early work by Raphael, — the *Protella* with seven small subjects painted in 1504 as part of the large altarpiece for the monastery of St. Anthony in Perugia, the main part of this large retable, which is the property of the heirs of the duke of Ripalda, has been for many years deposited but not exhibited in the National Gallery. The National Portrait Gallery at Kensington contains many paintings of different schools which are valuable both as works of art and from their interest as portraits. The Royal Academy has placed in the attics of Burlington House its valuable collection of diploma pictures, and in an adjoining room a few treasures of earlier art, among them a large cartoon of the Madonna and St. Anne by Leonardo da Vinci, — similar in subject to, but different in design from, an unfinished picture by him in the Louvre, and a copy of his *Genesio* at Milan by his pupil Marco d'Oggiono, of priceless value now that the original is an utter wreck. In the same room is a very beautiful but un-

finished piece of sculpture by Michelangelo, a circular relief of the Madonna.

England is especially rich in collections of drawings by the old Italian masters. The chief are those in the British Museum, in the Taylor British Buildings at Oxford, and in the possession of the Queen and of Mr. collection of Holbein. Among the collection in Windsor Castle there are eighty-seven portraits in red chalk by Holbein, all of wonderful beauty. The celebrated "Liber Veritatis," a collection of original drawings by Claude Lorrain, is in the possession of the duke of Devonshire at Chatsworth. In Buckingham Palace is a fine collection of paintings of the Flemish and Dutch schools. An almost uncountable large number of fine paintings of all schools are scattered throughout the private galleries of Britain, an account of the chief of these is given by Dr. Waagen, *Trauers der Arton Baudenkmale*, i. 1854. But many of the collections described by Dr. Waagen have since been moved or dispersed, the Peel and Wynn Ellisport collections have been purchased by the National Gallery, which has also acquired important pictures from the sales of the Eastlake, Barker, Novar, Hamilton, and Blenheim collections. The largest private galleries which still exist in England are those of the duke of Westminster (Grosvenor House), the duke of Sutherland (Stafford House), the earl of Ellesmere (Brudenell House), and the marquess of Eglar (Burgley House). The public gallery at Liverpool contains some very important Italian pictures, as does also the growing collection in Dublin. The Edinburgh National Gallery possesses a few specimens of early masters, among them part of the great altarpiece by the unknown "Master of Leisborn," a picture of St. Hubert by the "Master of Lyversberg," some fine Dutch pictures, and Gainsborough's masterpiece, the portrait of the artist's daughter, together with many examples of the excellent portraits by David Allan and Sir Henry Raeburn. In the palace of Holyrood is preserved a very beautiful altarpiece, with portraits of James III. and his queen and other figures. It is supposed to have been painted about 1480 by Van der Goes of the school of the Van Eycks. England is especially rich in the finest examples of Nicolas Poussin and Claude Lorrain, the paintings by the latter in Grosvenor House, the National Gallery, and elsewhere in the country are unrivalled by those of any foreign gallery.

The Louvre is rich in works of nearly all schools, and especially Louvre in fine examples of Signorelli, Mantegna, Raphael, Titian, Paul Veronese, Correggio, and the later Bolognese painters. Its chief glory is the possession of some of the very rare works of Da Vinci, — *La Vierge aux Rochers*, the Virgin and St. Anne, and the wonderful portrait of Mona Lisa and *La Belle Femelle*. It is, however, weak in examples of the earlier Venetian painters, not possessing a single genuine work by Giovanni Bellini. It contains some very beautiful frescoes by Botticelli and by Luni, and the finest work of Murillo which exists out of Seville, — the Virgin in Glory. The later Flemish and Dutch schools are well represented, the small painting of the Virgin with a kneeling Worshipper by Jan van Eyck is one of the loveliest pictures in the world, but the Louvre is otherwise deficient in paintings of his school. The portraits by Holbein, Rubens, and Van Dyck are of great importance. In the French school the Louvre is of course unrivalled — the paintings of Nicolas Poussin and Claude Lorrain are the best among them, but the general average of merit is very low. The Louvre also possesses a magnificent collection of drawings by the old masters.

The Berlin gallery, now rapidly being added to, contains a large German number very important Italian pictures, among them a Signorelli's finest easel picture (see fig. 3), — a classical scene with Pan and other nude figures playing on pipes, a masterpiece of powerful drawing. The gallery is more especially rich in works of the German, Flemish, and Dutch schools, including six panels from the large altarpiece of the Adoration of the Lamb at Ghent by Hubert and Jan van Eyck. The Dresden gallery is mainly rich in paintings of the Flemish and Dutch schools, but also contains some fine Italian pictures. Raphael's Madonna of St. Sisto is the chief glory of the collection, together with many fine examples of Giorgione, Palma Vecchio, Titian, Paul Veronese, and Correggio, and a number of works of the later Bolognese school. The gallery is especially remarkable for its genuine examples of that very rare master Giorgione. The Pinakothek at Munich possesses some good Italian pictures, among them four by Raphael and a number of fine Titians. It contains a large collection of German, Dutch, and Flemish paintings, with a number of fine portraits by Hans Dürer and Van Dyck. It is especially rich in works of Lucas Crauch the elder, of Memling, of Roger van der Weyden, of Wohlgemuth, and of Rembrandt.³ The Cassel gallery is mainly rich in Flemish and Dutch paintings. The small Wallraf-Richtartz Museum at Cologne contains a few paintings of great interest to the student of early German art.

The Belvedere gallery at Vienna is exceptionally rich in works Austrian of the Venetian school, especially Palma Vecchio, Titian, and Paul Veronese. Holbein, Rubens, Van Dyck, and other masters of the Flemish and Dutch schools are richly represented. Vienna also contains some large private galleries, chiefly rich in Flemish

¹ England generally is, however, very rich in the works of Holbein, — chiefly portraits.

² Now temporarily moved to Bethnal Green.

³ A most valuable catalogue of the Munich pictures, well illustrated with photographs, has recently been published.

Hampton Court

Other English galleries.

and Dutch pictures, and a magnificent collection of drawings by old masters. The Budapest gallery (Extrahydr collection) contains many fine Venetian and some Florentine pictures, with a large number of Flemish and Dutch works.

St. Petersburg. The Gallery of the Hermitage at St. Petersburg is one of the largest and most important in Europe, though weak in pictures of the early Italian schools; it contains fine examples of Lunn, Raphael, Titian, Paul Veronese, and the Bolognese school, and is extraordinarily rich in paintings by Murillo, Rembrandt, Rubens, Vanduyck, and the later Flemish and Dutch schools generally.

Belgium and Holland. The many galleries of Belgium and Holland are mostly rich in the works of local schools. Antwerp possesses the masterpieces of Rubens and many fine examples of his pupil Vanduyck. The church of St. Bavo at Ghent contains the masterpieces of the Van Eyckes, the main part of a large altarpiece in many panels with the Adoration of the Lamb as the central subject; this is only rivalled in point of size and beauty by the Fountain of Salvation painted by Jan van Eyck about 1432, and now in the museum of the Santissima Trinidad at Madrid. Among the many fine Flemish and Dutch pictures in the museum at The Hague is a half-length of an unknown lady by Holbein, which is one of the most beautiful portraits in the world (see fig. 27).

Spain. The gallery at Madrid is in some respects unrivalled both for its widely representative character—at least as regards the later schools—and from the number of exceptional masterpieces which it contains; it possesses, however, very few specimens of Italian art earlier than 1600. In the works of the later Italian masters it is very rich, possessing four important works by Raphael,—the Madonna called La Perla (once a Hampton Court in collection of Charles I.), the Descent from the Cross, the Virgin of the Rose, and Christ on His way to Calvary (*La Espanola*). No other gallery contains so many fine specimens of Titian's paintings; it includes a scene of Bacchus at Naves, with a nude sleeping figure of Ariadne in the foreground, the companion to the magnificent Ariadne in the English National Gallery, but surpassing it in beauty and perfection of preservation. The third picture of the type painted for the dukes of Ferrara and Modena at Madrid, it is known as the Sacrifice to Fecundity, and consists of a large group of nude infants sporting or sleeping, a perfect miracle for its wealth of colour and unrivalled flesh painting. In addition to these wonderful pictures there are some splendid portraits by Titian, and many of his later works, showing a sad decadence in his old age. The gallery also contains many important works of Paul Veronese and others of the Venetian school, and a very fine group of Flemish and Dutch pictures, including a number of noble portraits by Antonio Moro, Rubens, and Vanduyck, together with some of Claude Lorrain's best landscapes. In the Spanish schools the Madrid gallery is unrivalled; it contains a number of poor but interesting paintings by Juan de Juanes, the best collection of the works of Ribera (Spagnoletto), and the chief masterpieces of Velazquez. It is at Madrid alone that the greatness of Velazquez is fully realised, just as the marvellous talents of Murillo are apparent only in Seville. Among the many wonderful paintings by Velazquez in this gallery the chief are the Crucifixion, the Tapestry Weavers (*Los Esplendores*), the Surrender of Breda (*Las Lanzas*), the Drinking Peasants (*Los Borrachos*), the portrait group known as *Los Meninos*, and many magnificent portraits. The gallery also contains a number of Zurbarán's works, and many by Murillo, none of which are among his finest paintings. The best picture by Murillo at Madrid is the scene of St. Elizabeth of Hungary tending the Lepers, preserved in the Academia de San Fernando. Seville alone contains the real masterpieces of Murillo, a very unequal painter, who produced a large number of third-rate works, such as are to be seen in many of the chief galleries of Europe, but who at his best deserves to rank with the greatest painters of the world. It is impossible to describe the wonderful rich tone, the intense pathos, the finest of Raphael's early works, such pictures as the Crucified Christ embracing St. Francis, or the apparition of the Infant Saviour to St. Anthony of Padua, in the Seville gallery, and the larger composition of the latter scene in the cathedral. Other very noble works by Murillo exist in the monastic church of La Caridad. The Seville gallery also contains several of Zurbarán's chief pictures, and some by other painters of the Spanish school. The other chief gallery of Spain, that at Valencia, contains a number of weak but interesting pictures of early Spanish artists,—feeble imitations of the style of Francia and other Italian painters. It possesses also many pictures by Ribalta and other later and unimportant masters of the Valencian school.

Rome. The Vatican Gallery, though not large, contains a very large proportion of important pictures, such as a portrait group in fresco by Melozzo da Forlì, the unfinished monochromatic painting of St. Jerome by De Verone, the finest of Raphael's early works, the Coronation of the Virgin, the Madonna di Foligno, and the Transfiguration. The Coronation of the Virgin by Pinturicchio is one of his best panel pictures, and a portrait of a Doge by Titian a masterpiece of portraiture. The Last Communion of St. Jerome by Domenichino is his finest work. The chapel of San Lorenzo, painted by Fra Angelico (see FIGURE), the Appartamento Borgia by Pintur-

icchio, the stanze by Raphael, and the Sistine Chapel by Michelangelo are described in the articles on these painters. The Capitol contains but few works of much merit, the chief are a very beautiful series of frescos of Apollo and the Muses in separate panels, life-size, by some painter of the school of Passigno, probably Lo Spagna; they are remarkable for grace of drawing and extreme delicacy of colour. The Rape of Europa, by Paul Veronese, is a fine replica of that in the doge's palace at Venice. The gallery also contains some of the chief works of Guercino and Guido and a very noble portrait by Velazquez. The Borghese Gallery is perhaps the most important private collection in the world. It is rich in Florentine pictures of the 15th century, and possesses the celebrated Entombment by Raphael. A small panel of St. Stephen by Francia (signed) is of unusual beauty and interest,—very highly finished and magnificent in colour, it seems to show the influence of Jan van Eyck; it is one of Francia's earliest works, and is very far superior to those of his later style. The great glory of the gallery is the (so-called) Sacred and Profane Love by Titian (see fig. 16), one of the most beautiful pictures in the world both for design and colour, and a marvel for its rich warm rendering of flesh; it appears to be a portrait of the same lady repeated twice,—nude and draped. It belongs to a somewhat earlier time than the buxom trio in Madrid and London. This gallery contains also one of Van Dyck's finest portraits, that of Catherine de' Medici, and other excellent portraits of the Venetian school. The Danae by Correggio is an interesting example, very weak in drawing, but remarkable for the fine pearly tones of the flesh. The Corsini Gallery, now the property of the municipality of Rome, contains some good panels by Fra Angelico, but is mainly strong only in the 16th century. It also possesses a rich collection of early Italian engravings. The Doria Gallery is large, but contains only a small proportion of valuable pictures. Some paintings by Niccolò Rondinelli are of much interest; they show him to have been an able pupil and close imitator of Giovanni Bellini, to whom many paintings in various galleries are attributed which are really the works of pupils. A beautiful Madonna in the Doria Palace by Rondinelli has a *corallino* inscription with Bellini's name. The chief treasure of this collection are the portraits of two Venetians attributed to Raphael, and that of Pope Innocent X. by Velazquez,—the latter a marvel of dashing and almost too skilful execution. There is also a fine portrait of Andrea Doria by Sebastiano del Piombo, well modelled, but rather wanting in colour. The Sciarra-Colonna Palace contains a few good pictures, among them a very fine portrait of a violin-player by Raphael. The most beautiful picture in the gallery is a *corallino* attributed to Da Vinci, as is often the case with Lami's pictures. The Colonna, Barberini, and other private galleries of Rome contain but little that is noteworthy. The church of S. Maria sopra Minerva contains some splendid frescoes by Lippo Lippi, some of Pinturicchio's chief frescoes are in the churches of S. Maria del Popolo and S. Maria in Ara Coeli, and the monastery of S. Onofrio possesses a very lovely fresco of the Madonna and St. Joseph, kneeling, attributed to Da Vinci,—probably a pupil's work.

The Florentine Accademia delle Belle Arti contains a most valuable collection of early Florentine and other 16th-century pictures, including the finest panel picture by Gentile da Fabriano,—the Adoration of the Magi,—a rare example of Verocchio, partly painted by his pupil Da Vinci, some magnificent examples of Botticelli, good specimens of Fra Angelico, Ghirlandajo, Signorelli, Lippo Lippi, Fra Bartolomeo, and a group of minor masters, including one of his best works. The magnificent galleries in the Uffizi and Pitti Palaces contain an unrivalled collection of the great Florentine painters of all dates. In the Uffizi are several fine paintings by Raphael,—the Madonna del Cardellino, a portrait of Julius II., and an exquisitely finished head of an unknown lady. Among the many fine examples by Titian is his portrait of a nude lady reclining (Leda), his most wonderful work. In the same room (La Tribuna) is the circular panel of the Madonna and St. Joseph, the Soggevo work by Michelangelo, showing the influence of Signorelli. Many of Botticelli's finest works are in this gallery, and the Uffizi also possesses an almost unrivalled collection of drawings by Italian painters of all dates. The Pitti Palace contains some of the chief works of Raphael,—the early Madonna del Gran Duca, and portraits of Angelo Doni and his wife, the portraits of Cardinal Bibiena and Leo X. (in his later manner), the portrait of the young Seggolo, and the miniature Vision of Ezekiel. The portrait of a nun, attributed to Da Vinci, but probably the work of a pupil, is a work of extraordinary finish and refinement. The Magdalen and the lady's portrait (La Bella) by Titian are among his best works. Both these collections contain some good Flemish and Dutch pictures. In the church of Santa Croce are the chief works of Giotto, in S. Maria Novella the best pictures of Orcagna and Ghirlandajo, and in the monastery of S. Marco the principal frescoes of Fra Angelico. Some of the chief frescoes of Spinoello Azzurro, much repainted, exist in the secrecy of S. Miniato, and the most important fresco of Andrea del Sarto are in the church of S. Annunziata.

The small galleries at Perugia and Siena are of great interest for Italian collections of true works by painters of the local schools. The galleries

(J. H. M.)

SCHOPENHAUER, ARTHUR (1788-1860) was born in Dantzig (117 Heiligen-Geist Strasse) on 23d February 1788. Doomed for the first thirty years of his career to find his works ignored with galling silence, he came, from the year 1845 onwards, to be looked up by a scanty but devoted following as, what he himself claimed to be, the founder of the first true philosophy. Historical criticism has done much to dispel his pretensions to originality, and logical examination has demonstrated the incongruities lurking in his system. But the fact of his dominant influence on contemporary thought remains undiminished after every such disparaging analysis. He consoled himself for the neglect of his own generation by the assurance that his would be the philosophy of the future. His ideas, recommended by the mastery of language and brilliance of illustration which entitle him to a first class in literature, have become the burden of much of our current speculation, and have leavened to an unusual extent the view of life and of the universe which animates the average educated world and finds expression in literary art.

His father, Heinrich Floris Schopenhauer, the youngest of a family to which the mother had brought the germs of mental malady, was a man of strong will and originality, vehement and resolute in the extreme, and so proud of the independence of his native town that when Dantzig in 1793 surrendered to the Prussians he and his whole establishment withdrew to Hamburg. The mother of the future philosopher was Johanna Henriette Trosener. Both parents belonged to the mercantile aristocracy, the bankers and traders, of Dantzig. Johanna, who at the age of twenty accepted a husband of forty, was as yet undeveloped in character; and perhaps he hoped that her want of love, which she did not conceal, might be compensated by the community of tastes and interests which, under his guidance, would grow up between them. But the radical rift in the wedded heart could not be stopped up by a merely intellectual cement. The two children of the marriage, Arthur born in 1788 and Adele in 1796, bore (according to the theory of the former) the penalty of their parents' incompatibilities. While they inherited from their mother a high degree of intelligence and literary style, they were burdened by an abnormal urgency of desire and capacity for suffering, which no doubt took different phases in the man and the woman, but linked them together in a common susceptibility to ideal pain.

In the summer of 1787, a year after the marriage, the

elder Schopenhauer, whose commercial experiences had made a cosmopolitan in heart, took his young wife on a tour to western Europe. It had been his plan that the expected child should see the light in England, but the intention was frustrated by the state of his wife's health, and they had to beat a hasty retreat homewards in early winter. The name of Arthur, given to the child in St Mary's at Dantzig, was chosen because it remains the same in English, French, and German. The first five years of his life Arthur spent under the care of his mother, chiefly in their country house at Oliva, about 4 miles west of Dantzig. There, at the foot of the prettily wooded sandhills which look out upon the dim Baltic, the young mother enjoyed a life of leisure, dissipating the long solitary hours with her horses, the gondola on the pond, the fountains, and the lambs, or with the French novels her husband put amply at her disposal. It was only on Saturday and Sunday that he would quit his office in town and come down, generally in company with a friend or two, to get a glimpse of his wife and son. The latter was often taken on a visit for weeks to the manor-house, between Dantzig and the sea-coast, where his maternal grandparents lived. After 1793 the father never set foot in his old home, but Johanna was allowed every four years to revisit the scenes of her youth.

During the twelve years they had their home at Hamburg (1793-1805) the Schopenhauers made frequent excursions. The year after his sister's birth Arthur was taken by his father to France, and left for two years (1797-99) as a boarder with M. Gregoire, a merchant of Havre, and friend of the Hamburg house. The boy formed a fast friendship with his host's son, Anthime, and grew so familiar with French that by the end of his sojourn he had almost forgotten his mother-tongue. The youthful friends lost sight of each other for long years, and when the Frenchman sought to renew their correspondence in the evening of life they found that they had drifted far asunder, and unworthy suspicions led Schopenhauer to dismiss his old comrade in abrupt silence. Arthur returned alone by sea to Hamburg, and for the next four years had but indifferent training. When he reached the age of fifteen the scholarly and literary instincts began to awaken, and he became anxious to be initiated into the fraternity of the liberal arts and sciences. But his father, steeped in that old pride of caste which looks down upon the artist and the writer of books as mere means or instruments to decorate and diversify the life of business, was unwilling a son of his should worship knowledge and truth

¹ *Die Welt als Wille*, u. c. 43

as ends in themselves. Accordingly he offered his son the choice between the classical school and an excursion to England. A boy of fifteen could scarcely hesitate. In 1803 the Schopenhauers and their son set out on a lengthened tour, of which Johanna has given an account, to Holland, England, France, and Austria. Six months were spent in England, and Arthur, while his parents proceeded as far as Scotland, was left for a few weeks as a boarder with a Rev. Mr. Lancaster at Wimbledon. He found English ways dull and precise and the religious observances exacting, and his mother had—not for the last time—to talk seriously with him on his unsocial and wilful character. Perhaps the part of the tour which gave him most pleasure was the last,—a solitary pedestrian stroll along the ridge of the Riesengebirge, just before he joined his mother at Dantzic, September 1804, where he was confirmed.

At Hamburg in the beginning of 1805 he was placed in the office of a merchant called Jenisch. He had only been there for three months when his father, who had shown symptoms of mental alienation, fell or threw himself from an elevated opening of his warehouse into the canal. After his death the young widow (still under forty) got affairs wound up, and, leaving Arthur at Hamburg, proceeded with her daughter Adele in the middle of 1806 to Weimar, where she arrived only a fortnight before the tribulation which followed the victory of Napoleon at Jena. At Weimar her talents, hitherto held in check, found an atmosphere to stimulate and foster them; her æsthetic and literary tastes formed themselves under the influence of Goethe and his circle, and her little salon gained a certain celebrity. Arthur, meanwhile, was left at his desk in Hamburg, cursing his prosaic lot, and smuggling literature under the ledger, the hot blood of youth was turning his thoughts to morbid cynicism, and his easy-minded mother, alarmed at his discontent, adopted the advice of her friend Fernow, and offered him a release from the loathed task-work. He hastened to make up lost ground, and at the age of nineteen began to decline *mensa* with Doering at Gotha. But the wantonness and restiveness which he had grown familiar with in the lax schooling of the world would not let him alone. He allowed his satirical pen to play on one of the teachers of the grammar-school, and professional etiquette required Doering to dismiss his pupil. After a plain but gentle rebuke for his folly, his mother settled him at Weimar—not in her own house, for, as she told him, she was content to know that he was well and could dispense with his company—but with the Greek scholar Passow, who superintended his classical studies. This time he made so much progress that in the course of two years he became a tolerable scholar, and read Greek and Latin with fluency and interest.

In 1809 his mother handed over to him (aged twenty-one) the third part of the paternal estate, a sum of 19,000 thalers, which, being invested in good securities, yielded him from the first a yearly income of more than 1000 thalers—£150. Possessed of this fair patrimony, Schopenhauer in October 1809 entered the university of Göttingen, with a clear plan of acquiring all that machinery of knowledge which schools can give. The direction of his philosophical reading was fixed by the advice of Professor G. E. Schulze to study, especially, Plato and Kant. For the former he soon found himself full of reverence, and from the latter he acquired the standpoint of modern philosophy. The names of "Plato the divine and the marvellous Kant" are conjunctly invoked at the beginning of his earliest work. But neither the formal exercises of the class-room nor the social and hygienic recreations which he did not fail to combine when they filled his hours to the exclusion of the ideas which began to formulate them-

selves in him. Contempt for the superficiality of human life settled itself more and more deeply in his heart, with the sense of a bitterness taunting the very source of being, and the perception that the egotism of individuals seeks for nothing better than to push on the load of misery from one to another, instead of making an effort to reduce the burden. These pessimistic reflexions (which his mother found eminently unsocial) were naturally concomitant with groundless nervous terrors, sudden panics would dash over his mind, and even in those days he had begun to keep loaded weapons always ready at his bedside. As a philosopher has said, "the sort of philosophy we choose depends on the sort of people we are, for a philosophical system is not a dead bit of furniture—it draws its life from the soul of the man who has it." He was a man of few acquaintances, amongst the few being Bunsen, the subsequent scholar-diplomatist, and Bunsen's pupil, W. G. Astor, the son of Washington Irving's millionaire hero. Even then he found his trustiest mate in a poodle, and its beakskin was an institution in his lodging. Yet, precisely because he met the world so seldom in easy dialogue, he was unnecessarily dogmatic in controversy; and many a bottle of wine went to pay for lost wagers. But he had made up his mind to be not an actor but an onlooker and critic in the battle of life, and, when Wieland, whom he met on one of his excursions, suggested doubts as to the wisdom of his choice, Schopenhauer replied, "Life is a tawdry business, I have resolved to spend it in reflecting upon it."

After two years at Göttingen, he took two years at Berlin, where the university had been founded only four years before. Here also he dipped into divers stores of learning, notably classics under Wolf. In philosophy he heard Fichte and Schlegelmacher. Between 1811 and 1813 the lectures of Fichte (subsequently published from his notes in his *Nachgelassene Werke*) dealt with what he called the "facts of consciousness" and the "theory of science," and struggled to present his final conception of philosophy. These lectures Schopenhauer attended,—at first, it is allowed, with interest, but afterwards with a spirit of opposition which is said to have degenerated into contempt, and which in after years never permitted him to refer to Fichte without contumely. Yet the words Schopenhauer then listened to, often with baffled curiosity, certainly helped to give direction to the current of his speculation.

Schopenhauer did not find the city of intellect at all to his mind, and was lonely and unhappy. One of his interests was to visit the hospital La Charité and study the evidence it afforded of the interdependence of the moral and the physical in man. In the early days of 1813 sympathy with the national enthusiasm against the French carried him so far as to buy a set of arms; but he stopped short of volunteering for active service, reflecting that Napoleon gave after all only concentrated and untrammelled utterance to that self-assertion and lust for more life which weaker mortals feel but must perforce disguise. Leaving the nation and its statesmen to fight out their freedom, he hurried away to Weimar, and thence to the quiet Thuringian town of Rudolstadt, where in the inn *Zum Ratten*, out of sight of soldier and sound of drum, he wrote, helped by books from the Weimar library, his essay for the degree of doctor in philosophy. On the 2d of October 1813 he received his diploma from Jena; and in the same year from the press at Rudolstadt there was published—without winning notice or readers—his first book, under the title *Ueber die verfahrte Wurzel des Satzes Satz vom verursachenden Grunde*, in 148 pages 8vo. verursach
enden

Schopenhauer's monograph, *On the Unavoidable Root of the Prem-Grand* *principle of Sufficient Reason* urged that, in discussing the principle of necessary connexion, philosophers had failed to distinguish between

reason as ground of belief and reason as cause of a fact. The principle gives expression to the law that nothing singular and unconnected can be an object for us but only as forming part in a system. This law has four main roots, according to the four classes of objects, in each of which a special form of connexion prevails. These objects are—(1) real objects of perception, where the relation of cause and effect requires each state to be dependent on its antecedent; (2) propositions, which are tied together as premises and conclusions; (3) the formal conditions of perception, viz. space and time, where each part is intuitively seen to be in reciprocal dependence on every other; (4) voluntary agents, where the law of motivation prescribes the dependence of action upon the idea of an object presented to the character of the agent.¹ Modifying the Kantian theory, that things are as we perceive them, he emphasizes the intellectual operation which elevates sensation to perception. The feeling of attention in an organ is taken by the intellect, whose one category is causality, to refer to a real, *i. e.*, material object which generates the change in our body. But the reference is an intuitive interpretation of a felt modification in the organism. Hence the important place assigned to the human body—it is the first of objects, the "immediate object," the means by which all other objects come within consciousness. As a perpetual correlative of external perceptions, the body further serves as an instrument for separating phantasm from fact. To detect and sear away hallucination we have only to realize the presence of our bodies. In dealing with motives Schopenhauer touches upon the relation between volition and cognition. The ego—which is the subject that knows—is a mere correlative to the known object perceived and subject perceiving are not two things, but one, perpetually dividing itself into two poles, and what are called the several faculties of the ego are only an inference or a reflex from the several classes of mental object. The "I" in "I know" is already the implication and virtual presence of knowledge. But the "I will" is a new fact—the revelation of another aspect of the world, the first fact of inner and real existence. In this perception there is given us the unity of the volitional self with the knowing subject, and this identity of the "I" with the "I know" and the "I will" in Schopenhauer's words the *muscle par excellence* (*das Wunder der Bewegung*, § 48).

In November 1813 Schopenhauer returned to Weimar, and for a few months boarded with his mother. But the strain of daily association was too much for their antagonistic natures. The mother felt herself *gênée* in the presence of a disputatious and gloomy son; she missed the ease of her emancipated life, and her friends found their movements watched by a suspicious eye, which was ready to surmise evil in the open and light-hearted style of housekeeping. In short, his splenetic temper and her volatility culminated in an open rupture in May 1814. From that time till her death in 1838 Schopenhauer never saw his mother again. It was during these few months at Weimar, however, that he made some acquaintances destined to influence the subsequent course of his thought. Conversations with the Orientalist F. Mayer directed his studies to the philosophical speculations of ancient India. In 1808 Friedrich Schlegel had in his *Language and Wisdom of the Old Hindus* brought Brahmanical philosophy within the range of European literature. Still more instructive for Schopenhauer was the imperfect and obscure Latin translation of the *Upanishads* which in 1801-2 Anquetil Duperron had published from a Persian version of the Sanskrit original. Another friendship of the same period had more palpable immediate effect but not so permanent. This was with Goethe, who succeeded in securing his interest for those investigations on colours on which he was himself engaged. Schopenhauer took up the subject in earnest, and the result of his reflexions (and a few elementary observations) soon after appeared (Easter 1816) as a monograph, *Ueber das Sehen und die Farben*. The essay, which must be treated as an episode or digression from the direct path of Schopenhauer's development, due to the potent deflecting force of Goethe, was written at Dresden, to which he had transferred his abode after the

¹ This classification Schopenhauer subsequently modified,—substituting for the first and fourth a graduated scale rising from cause proper (in inorganic nature) to stimulus (in vegetative life) and motive (in the animal world), the last again being either intuitive motive, as in the lower animals, or rational motive, as in man.

rupture with his mother. It had been sent in MS to Goethe in the autumn of 1815, who, finding in it a transformation rather than an expansion of his own ideas, inclined to regard the author as an opponent rather than an adherent.

The pamphlet begins by re-stating with reference to eight the *Essay on* general theory that perception of an objective world rests upon a *Syph* instinctive causal postulation, which even when it misleads still and remains to haunt us (instead of being, like errors of reason, open *Colours* to extirpation by evidence), and proceeds to deal with physiological colour, *i. e.*, with colours as felt (not perceived) modifications of the action of the retina. First of all, the distinction of white and black, with their mean point in grey, is referred to the activity or inactivity of the total (china in the graduated presence or absence of full light. Further, the eye is endowed with polarity, by which its activity is divided into two parts qualitatively distinct. It is this circumstance which gives rise to the phenomenon of colour. All colours are complementary, or go in pairs; each pair makes up the whole activity of the retina, and so is equivalent to white, and the two polar activities are so connected that when the eye is exhausted the other spontaneously succeeds. Such pairs of colour may be regarded as infinite in number, but there are three pairs which stand out prominently, and admit of easy expression for the ratio in which each contributes to the total action. These are red and green (each=3), orange and blue (2 1), and yellow and violet (3 1).² This theory of complementary colours as due to the polarity in the qualitative action of the retina is followed by some criticism of Newton and the seven colours, by an attempt to explain some facts noted by Goethe, and by some reference to the external stimuli which cause colour.

The grand interest of his life at Dresden was the composition of a work which should give expression in all its aspects to the idea of man's nature and destiny which had been gradually forming within him. Without cutting himself altogether either from social pleasures or from art, he read and took notes with regularity. More and more he learned from Cabanis and Helvetius to see in the will and the passions the determinants of intellectual life, and in the character and the temper the source of theories and beliefs. The conviction was borne in upon him that scientific explanation could never do more than systematize and classify the mass of appearances which to our habit-blinded eyes seem to be the reality. To get at this reality and thus to reach a standpoint higher than that of etiology was the problem of his as of all philosophy. It is only by such a tower of speculation that an escape is possible from the spectre of materialism, theoretical and practical, and so, says Schopenhauer, "the just and good must all have this creed. I believe in a metaphysic." The mere reasonings of theoretical science leave no room for art, and practical prudence usurps the place of morality. The higher life of aesthetic and ethical activity—the beautiful and the good—can only be based upon an intuition which penetrates the heart of reality. Towards the spring of 1815 the work was nearing its end, and Brockhaus of Leipzig had agreed to publish it and pay the author one denat for every sheet of printed matter. But, as the press loltered, Schopenhauer, suspecting treachery, wrote so rudely and haughtily to the publisher that the latter broke off correspondence with his client. In the end of 1815, however, the book *Welt als* appeared (with the date 1819), in 725 pages 8vo, with the title *Die Welt als Wille und Vorstellung*, in four books, with an appendix containing a criticism of the Kantian philosophy.

The first book of *The World as Will and Idea* resumes the argument of the earlier work, that all objects are constituted by intellectual relations, describable as forms of the causal principle. As so apprehending a world of objects, man is said to possess intelligence (*Vernunft*), the perception of individual sentences and existences. It is a faculty he shares with the animals, and by its means the world presents itself as an endless number of objects in space and time bound together by necessary laws of causality. But man has also the power of reason (*Vernunft*), by which he generalizes, the vehicle of this generalization being language. By means of

² In this doctrine, so far as the facts go, Schopenhauer is indebted to a paper by B. Waring Darwin in vol. LXVI of the *Transactions of the Philosophical Society*.

language and reasoning he rises out of the animal immersion in the present and is able to anticipate the future. He forms general ideas and thus can preserve and communicate abstract knowledge. But reason, though its "laws of thought" have a formal truth of their own, has no independent value either as theoretical or as practical. In the former respect it serves rise to scientific knowledge—the knowledge of facts and sequences not in their single occurrences but as instances of a general law. By means of the general truths thus arrived at we can deduce or prove. But a proof is, after all, only a means of showing the disputations that something which they deny is inseparably bound up with something they admit. It is a mistake, therefore, to substitute for the ocular demonstration of which geometry is susceptible a syllogistic reasoning which could compel assent but cannot inspire insight. Singular experiences are the true workers which support the luxury of general ideas, and reasoning cannot claim to be more than a re-arrangement of products from other fields.

Reason is equally important and equally limited as a factor in conduct. It enables us, as it were, to lead a second life, guided by general principles and not by single appetitions. Such a life is what is called a life according to reason. Trained in the ideal of the Stoic sage, The wise man carries out the items of conduct according to a general plan and is superior to the impulses of the moment. But here too the general rests upon the particular, a systematic happiness takes the place of single and conflicting pleasures, but still can only justify itself by procuring pleasure. Thus, unless there be a new perception of life's meaning, reasoning cannot make a man virtuous; it can only make him prudent, it tells him how to reckon with his natural character, but it cannot show him how to amend it.

Book II is an attempt to name that residual reality which is presupposed but not explained in every scientific explanation, whether etiological or morphological. The key is found in the consciousness of ourselves as exerting will. What to the inner consciousness is volition is to the outer perception a bodily movement. And as each act of volition is perceived in a bodily motion, so will as a whole is by us perceived as body. This consciousness that my body is my will objectified—my will translated into terms of scientific apprehension—is the "philosophical truth" of truths. And, generalizing this truth, we conclude that, as our corporeal frame is the visibility of our mode of will, so everything is some grade in the objectification of the will. While the etiology of science accounts for the familiar complex by a simpler and more abstract cause, philosophy must use the simpler and more abstract to explain the more rudimentary. The law of motivation is taken as a key to the open incomprehensibility of mere causation, and in the stone we presume a feeble analogue of what we know as will. The will as such, apart from its objectification in animals, knows nothing of motives, which, though they explain the special circumstances, presuppose the underlying and operative force. No doubt a false idea of simplicity has often led theorists to reduce all sciences in the last resort to applied mathematics, in which the mysterious something called force was eliminated and only the forms of space and time and motion left. But, though it is doubtless possible to reduce the list of original forces, we cannot get rid of an unexplainable activity. Hence the original force or will is beyond the range of causality, every cause is only an "occasional cause," and but states the temporal conditions of operation of the eternal energy.

Will each several of these is the cause of the other. The numerical differences of objects do not touch the underlying activity. It is felt in one oak as much as in a million, for time and space are only semblance for (animal) intelligence. And therefore, instead of wondering at the uniformity pervading the instances of any objectification of will, we should remember that the will-force operating in all is the same, and reveals its inner identity in the common law. For the same reason the adaptations of the parts of an organism to the body and to the environment are only the consequences of the unity of will. Just as the series of actions throughout a life are only the utterances of one original character, and so intrinsically interdependent, so the grades of objectification in nature are the expression of one identical will, which forms the conditions of existence as well as the living creatures accommodating themselves to them. Will, which appears in its lowest grade of objectification as the physical forces of inorganic nature, rises in the vegetative world to a peculiar sympathetic response to the stimulation by external circumstances, and in the animal world produces for itself a special organ, the brain, which possesses the power of presenting under the forms of sense and intellect that objective manifestation of will which we call the world of our experience. With the existence of the animal brain, the world emerged into time and space. It was a step necessitated by the growing complexity of type in the will-products, which could neither exist nor preserve their kind without this new instrument which substituted conscious adaptation for unconscious teleology. In this strange mythology by which Schopenhauer replaces the mystery of creation we see the magic world of will, weaving ever higher complexities of material existence, brought at length by

stress of circumstance, to force a material organ which shows the sense-world as the objectification of the will. In this one material organ the will has come to see itself expanded into a complicated order of time and place. But at first the brain and its functions, knowledge, are solely employed in the service of the will.

Book III shows how the intellect is emancipated from this bond—Book IV to the will. When we contemplate an object simply for its own sake, forgetting everything and ourselves even in the vision, then what we have before us is no longer one thing among many but a type, not one of a class but an ultimate individuality, not a particular but an adequate embodiment of the universal. Instead of the general concept or class notion we have the Platonic "idea"—one image into which all the essential life of the object has been concentrated. To realize this individual which has not entered into the bonds of individuality, this universal which is not a mere genus but the eternal truth of the individual, is the province of genius. The man of genius, neglecting the search for relationships between things—unpractical and to practical judgment sometimes seeming to have a touch of madness—instead of seeking to classify a thing or find out what it is for, looks at it for its own sake and sees in it one type or ideal which is seeking for expression in its various and contingent manifestations. Such genius begets art. Yet so much at least of genius is in all men that they can follow where the artist leads and see through his eyes. Everything as thus contemplated disinterestedly for its own sake and in its permanent significance is beautiful. Yet one thing is more beautiful than another. For there are objects which more than others facilitate the quiescence of desire and present to us their permanent character without suggesting or stimulating appetite. The desire of sight is more independent than others of associations of desire, the past and distant purer from self-interest than the present. Those objects are especially beautiful where the significant idea is most clearly presented in the individual form. Indeed, when a certain effort is required to keep out of sight the general bearing of the object on the will, then the object, where the perception of genius still sees the perfect type in the single form, is called sublime. The several arts fall naturally into an order according to the degree of the passive enjoyment in the contemplation of inorganic forms to the active perception of will in its most complex types. Architecture seeks in works dedicated to human use to give expression to the fundamental features of physical force, e.g., cohesion, weight, &c., and to that end it intensifies the appearance of stasis by refusing the forces an easy and immediate lapse into their natural tendency. In sculpture it seeks to show the essential nature of things, the beauty and grace of the human form, &c., the "idea" of that form as a whole and in the single movements. Here the "idea" is not derived by comparison and abstraction of observed forms, but we, as ourselves the will seeking manifestation, anticipate by our ideal the meaning of the imperfect phases and lay down an *a priori* canon of beauty. While sculpture gives expression to the more generic type in figure and motion, painting aims at representing action. But even historical pictures seek in a given scene to present not the historical importance of the action but its permanent meaning. Poetry, which uses an arrangement of general concepts to convey an "idea," or moulds reality out of abstractions, gives us the central and abiding truth which history usually dissipates in a host of particulars and relations. In lyric poetry the individual subject of will presents himself as the subject of artistic perception. His own experience is displayed in typical situations. In tragedy the truth shown is the inner conflict at the very root of the will. The hero is exhibited as brought to see the aimlessness of all will, and by suffering he learns resignation. Music, unlike the other arts, is an image of the movement of will not yet objectified, and in its elements and harmonies we have a parallel to the stages and complexities of the actual world. Hence the explanation of music would be a philosophy of the world.

But art, though it affords an interval of rest from the drudgery of will-eries, cannot claim to be more than a transient consolation. Book IV indicates a surer way of release. It reminds us that our life is the phenomenon of the will—a phenomenon which begins at birth and ends at death, and of which every instant is a partial birth and a partial death. But the cessation of the individual life is not an annihilation of the will; our essential being is indestructible. The manifestation of our human life as individual and disposed in an endless multitude of actions. Experience sums up these in a single formula—the maxim of our empirical character, and that result itself is the type or idea which reveals the one unalterable utterance of will, which is the intelligible character.¹ It is this immemorial act which fixes our empirical character, which gives the consistency and regularity of our acts. *Wille non desinitur*. Character is given (by an ante-phenomenal act) it is not acquired. If in one sense we can speak of an "acquired character," we mean thereby that we now understand what manner of men we are, that we have learned the best and worst of ourselves. But, though the character is given once

¹ The terms are borrowed from Kant.

for all in the beginning, knowledge is not useless. We can learn to adopt new means though the end of will remains unaltered. It is this new knowledge which causes repentance, when we see we have adopted undue methods to attain our aim. The survey of the phenomena of life in the light of their principle shows that all life is a ceaseless battle for existence between individuals, that happiness is only negative, viz., a relief from pain, that life is a tragedy. But the natural man, unmoraled in the sense of life, plays the egoist as if he were the centre of existence and the will to life spoke in him alone. In such a spirit he not merely acts as if affirming his own will to life, but as if he denied that of others. He commits injustice. The sense of wrong-doing, he may feel, is the witness of consciousness to the identity between himself and others, it is the appearance of moral law and gives rise to that sense of right which is the beginning of ethics. But for the most part practical reflections note only the evils caused by egoism, and induce the sufferers to form a law to produce by repression the same results as morality attains by stimulation. Thus penal law, as opposed to moral law, aims only at checking intrusions upon the rights of others, and the whole political organization is only an instrument for checking egoism by egoism, for making each seek the welfare of all because it includes his own. Its justice is temporal, it adds an additional pain by legislative machinery, with a view to the welfare of the greater number.

But there is another and an eternal justice. Here there is no separation of time and place between the wrongdoer and the sufferer. This eternal justice reveals itself to him who, having seen through "the veil of Maya," understands that in the world of truth the divisions between individuals fall away, and that he who does wrong to another has done the wrong to his own self. The persuasion of this doctrine of eternal justice is so ingrained in human nature that we welcome the punishment that overtakes the vicious evildoer. Similar lessons are hidden in the myths of transmigration of souls. The secret sense that the pains of others are in reality not alone constitutions the torments of remorse which visit the wicked. On the contrary, who has been brought to see through the veil of individuality into the unity of all being, will not merely practise justice,—he will be animated by a universal benevolence. Instead of *epos* or the blind lust of life (seen at its strongest in sexual appetite), he has learned, by means of self-knowledge, that *dyaus* which is pitying love, or *caritas* *genus à humanis*.

Such benevolence only alleviates the misery of others. It culminates in self-sacrifice, which is earned out by voluntary and complete chastity, by utter poverty, by mortification, by fasting, and last of all by death. Such a course of life, however, is seldom taught by instruction alone, and the broken will generally comes only where a mighty shock of grief reveals the inevitable pain of existence and brings a questive to the last of life. Yet the victory over the will to life is not a natural one at all; the supremacy must be retained by a career of asceticism. Such ascetics, in whom the will to life was dealen and the body remained as a mere empty semblance, were the saints and mystical devotees of all ages. They had crucified the flesh with its affections and lusts. Their will had been emancipated from the bondage to which in life it was subject, had been released from the objectionation in corporeity and restored to its original infinity. In such saints alone has the essential freedom of the will appeared on the temporal scene, but appeared only to destroy the old Adam and bring in the new birth. By the lively knowledge of the truth of things the will has denied itself, has passed into a stage where the objective world is as if it were not,—the stage which was when will as yet had not gone forth to objectify itself in a world, and when knowledge had not yet mirrored the reality in an idea, when, in short, nothing was.

Visit to
Italy.

Long before the work had come to the hands of the public, Schopenhauer had rushed off to Italy and exchanged the labours of giving the gospel of renunciation a metaphysical basis for the gaiety of southern life and the influences of classic art. At Venice, where he first lingered for a while, he found himself a fellow-denizen with Lord Byron; but, except for a solitary chance when his jealousy was stured by the outspoken admiration of his fair Venetian companion for the handsome Briton who rode past them on the Lido, the two insurgent apostles of the *Weltknechters* never came across each other's path. At Rome, where he passed the depth of winter, he saw the first copies of his book. It found him in assiduous attendance on the art galleries, the opera, and theatre,—turning from the uncongenial companionship of his romantic countrymen and gladly seizing every chance of conversing in English with Englishmen. In March 1819 he had gone as far as Naples and Piestum. On his way homewards

he was startled by receiving at Milan a letter from his sister announcing that in consequence of the failure of the Dantzic house a large part of his own and his mother's and nearly the whole of his sister's fortune were endangered. This change of circumstances was a heavy blow to the ladies, and he himself was almost induced by the mischance to qualify himself to teach in the university at Heidelberg in July 1819. But he sternly refused the compromise of seventy per cent offered by the insolvent firm, and was so angrily suspicious with his sister who accepted it that he ceased to correspond with her for about fourteen years. Fortunately his determined and skilful assertion of his rights was crowned, after a long dispute, with success. He recovered the whole debt, receiving in principal and interest the sum of 9400 thalers.

After some stay at Dresden, hesitating between fixing himself as university teacher at Göttingen, Heidelberg, ^{ment at} Berlin, he finally chose the last-mentioned. In his examination before the faculty (*disputatio pro senia legendi*) he enjoyed what he reckoned the satisfaction of catching up Hegel (who had just been appointed professor) in a lax use of a technical term ("animal" for "organic" functions). And in his first and only course of lectures he had the further satisfaction of selecting as his hours the same times (12 to 1 on Monday, Wednesday, and Friday) as Hegel had taken for his principal class. This course on the first principles of philosophy or knowledge in general, given in the summer of 1820, was not a success,—indeed did not reach its natural end, and, though the notice of lecture was repeated during his stay in Berlin up to 1831, the lecture-room knew him no more. Brilliant as he was in powers of luminous illustration and characteristic as is his style, he was wanting in the patient exposition of a subject for its own sake and not as the field for exemplifying a favourite thesis. The result of his experiences in 1820-21, which he attributed to Hegelian intrigues, was to intensify his suspicions of his colleagues, one of whom, F. E. Beneke (another alleged victim to Hegel's jealousies), he accused of garbled quotations in his review of *The World as Will and Idea*. Except for some attention to physiology, the first two years at Berlin were wasted. In May 1822 he set out by way of Switzerland for Italy. After spending the winter at Florence and Rome, he left in the spring of 1823 for Munich, where he stayed for nearly a year, the prey of illness and isolation. When at the end of this wretched time he left for Gastein, in May 1824, he had almost entirely lost the hearing of his right ear. Dresden, which he reached in August, no longer presented the same hospitable aspect as of old, and he was reluctantly drawn onwards to Berlin in May 1825.

The place had unpleasant associations of many kinds, but one disagreeable incident of his former stay now returned to him in a judicial award of pains and penalties. One day, about a year after his first settlement in Berlin, on 12th August 1821, on returning to his lodging he found three women standing in the passage in front of his room door. The event had annoyed him before, and his landlady had promised it should not occur again. On this occasion accordingly Schopenhauer ordered them out of what he held to be his own "stair-head," walked into his room, and emerged in a few minutes with hat and stick as he had entered. One of the women was still on the spot,—a sempstress, forty-seven years old, a friend of the landlady, and occupant of a small chamber adjacent to that of Schopenhauer. This person he ejected, and when she returned to pick up a piece of cloth (there stood a chest of drawers belonging to her in the passage) he put her forcibly out again, upon which she fell with a shriek that alarmed the house. Next day she lodged an action against him for personal injuries, and, after a variety of opposing deci-

sions, the final issue was in 1826 to award the complainant compensation (with five-sixths of cost, and a small sum for medical expenses) to the amount of a quarterly alimment of fifteen thalers, which sum she received till her death, fifteen years afterwards.

The six years (1823-31) at Berlin were a dismal period in the life of Schopenhauer. In vain did he watch for any sign of recognition of his philosophic genius. Hegelianism reigned in the schools and in literature and basked in the sunshine of authority. It was a bad time for an independent thinker who ignored the state and the yearlong alliance between philosophy and theology. Thus driven back upon himself, Schopenhauer fell into morbid meditations, and the world which he saw, if it was stripped naked of its disguises, lost its proportions in the distorting light. The sexual passion had a strong attraction for him at all times, and, according to his biographers, the notes he set down in English, when he was turned thirty, on marriage and kindred topics are unfit for publication. He had in opening manhood been so fascinated by a Weimar actress that he declared he would take her to his home though he found her breaking stones on the roadside. Later years had nipped the freshness of his enthusiasm, and casual experiences generated an overweening misogyny, which, while allowing woman her place in the natural economy, regarded the *lady* as the invention of a false civilization. Yet in the loneliness of life at Berlin the idea of a wife as the comfort of gathering age sometimes rose before his mind,—only to be driven away by cautious hesitations as to the capacity of his means, and by the shrinking from the loss of familiar liberties. He continued his bachelorhood, and found consolation in less onerous associations. At home he tuned his flute, he dined, and it might be conversed, with his fellow-guests at the Hotel de Russie, he read for hours at the royal library, and gave his evenings to the theatres. But he wrote nothing material. In 1828 he made inquiries about a chair at Heidelberg, and in 1830 he got a shortened Latin version of his physiological theory of colours inserted in the third volume of the *Scriptores Ophthalmologiae Minores* (edited by Radnus).

Another pathway to reputation was suggested by some remarks he saw in the seventh number of the *Foreign Review*, in an article on Damron's *French Philosophy in the 19th Century*. With reference to some statements in the article on the importance of Kant, he sent in very far English a letter to the writer, offering to translate Kant's principal works into English. He named his wages and enclosed a specimen of his work. His correspondent, Francis Haywood, made a counter-proposal which so disgusted Schopenhauer that he addressed his next letter to the publishers of the review. When they again referred him to Haywood, he applied to Thomas Campbell, then chairman of a company formed for buying up the copyright of meritorious but rejected works. Nothing came of this application.¹ A translation of selections from the works of Balhazar Gracian, which was published by Frauenstädt in 1862, seems to have been made about this time.²

In the summer of 1831 cholera raged at Berlin, and Schopenhauer fled to Frankfurt. About a year later he adjourned to Mannheim. But after eleven months' experience of the latter he decided, from a carefully weighed list of comparative advantages, in favour of Frankfurt. And there, accordingly, for the rest of his life he remained. He resumed correspondence with his sister, who was living with her mother in straitened circumstances at Bonn

At first the good people of Frankfurt knew him, not as the celebrated philosopher, but as the son of the famous Johanna Schopenhauer,³ and as the companion of a familiar poodle. The day had not yet risen when, as he had prophesied to his mother (who joked at his book on "four-fold root" as smelling of the apothecary), his works would be read of all, and hers only be used by the grocer to wrap his goods in. The sense of unappreciated work, aggravated by ill health and by pecuniary worry about his Dantzig property, sank deep into a heart that was yearning for outward recognition. He seemed to see around him none but enemies, a world mainly filled with knaves and fools, where a true man was rarer than an honest woman, and where the very touch of society was so perilous that irony and reserve were imposed on every one who retained his self-respect. In solitude he devoured his own soul. At the hotel table a stranger might occasionally be drawn into listening to his vigorous monologue, but it was seldom he was thus encouraged to discourse. Groundless fears of hidden dangers made him see himself and every other independent genius the aim of a conspiracy of vulgar charlatans. He would never entrust his neck to the barber's hand; and he succeeded in secreting his valuables so thoroughly that some of them were after his death recovered only after much search.

Ever since the publication of *The World as Will and Idea* he had silently waited for some response to his message. He had uttered the word he felt himself charged to utter. As the years passed he noted down every confirmation he found of his own opinions in the writings of others, and every instance in which his views appeared to be illustrated by new researches. Full of the conviction of his idea, he saw everything in the light of it, and gave each *aperyu* a place in his alphabetically arranged note-book. Everything he published in later life may be called a commentary, an excursus, or a scholium to his main book; and many of them are decidedly of the nature of commonplace books or collections of notes. But along with the accumulation of his illustrative and corroborative materials grew the bitterness of heart which found its utterances neglected and other names the oracles of the reading world. The gathered ill-humour of many years, aggravated by the confident assurance of the Hegelians, found vent at length in the introduction to his next book, where Hegel's works are described as three-quarters utter absurdity and one-quarter mere paradox,—a specimen of the language in which during his subsequent career he used to advert to his three predecessors Fichte, Schelling, but above all Hegel. This work, with its wild outcry against the philosophy of the professoriate, was entitled *Ueber den Willen in der Natur*, and was published in 1836.

The eight essays which go under the title of *The Will in Nature* will in seek to show that his theory has the unique distinction of finding *Nature* in physical science testimony to its metaphysical doctrines that will is the primary basis of all nature and intellect a derivative phenomenon. Often a trivial similarity of phrases serves to establish in his judgment an agreement of radical view. In the second essay he argues for the origin of animal organization from will, pointing out how in growing creatures the tendency to use an organ appears before the organ itself is formed, and maintaining that, instead of seeking the protoplasm of the animal kingdom in a mere lump of vitalized matter, to be moulded by external conditions, we should

¹ Johanna Schopenhauer (1766-1838) was in her day an authoress of some reputation. Besides editing the memoirs of Fernow, she published *Notes on Travels in England, Scotland, and Southern France* (1813-17), *Johann van Eyck and his Successors* (1823); three romances, *Gabriele* (1819-20), *Die Tante* (1828), and *Sidonius* (1828), besides some shorter tales. These novels teach the moral of renunciation (*Entsagung*). Her daughter Adele (1796-1840) seems to have had a brave, tender, and unsatisfied heart, and lavished on her brother an affection he sorely tried. She also was an authoress, publishing in 1844 a volume of *Haus-, Wald-, und Feld-Mährchen*, full of quaint poetical conceits, and in 1845 *Anna*, a novel, in two vols.

² It was not till 1841 that a translation of Kant's *Kritik* in English appeared.

³ He also projected a translation of Hume's *Essays* and wrote a preface for it.

look for it in the immemorial act of will which is the timeless origin of living beings. The third essay represents the intellectual "the world as idea"—as having its origin in the narrow partition which in men and animals is interposed between the stimulation of a cause and the reaction which supervenes. From this realistic standpoint, nihilism seems an unfortunate in nature, an accident associated with the fortunes of man, and made vicious in the genus which can behold the world "in myopic meditation, fancy-free." The fourth essay traces the grades of disproportion between cause and effect from inorganic to organic nature. Where there is causality there is will, but for us the more obviously the one shows itself the less is the other remarked. Another paper seeks to connect animal magnetism (mesmerism, hypnotism) and magic with the doctrine that in each of us the whole undivided will remains its miraculous potency.

In 1837 Schopenhauer sent to the committee entrusted with the execution of the proposed monument to Goethe at Frankfurt a long and deliberate expression of his views, in general and particular, on the best mode of carrying out the design. But his fellow-citizens passed by the remarks of the mere writer of books. More weight was naturally attached to the opinion he had advocated in his early criticism of Kant as to the importance, if not the superiority, of the first edition of the *Kritik*, in the collected issue of Kant's works by Rosenkranz and Schubert in 1838 that edition was put as the substantive text, with supplementary exhibition of the differences of the second.

In 1841 he published under the title *Die beiden Grundprobleme der Ethik* two essays which he had sent in 1838-39 in competition for prizes offered. The first was in answer to the question "Whether man's free will can be proved from self-consciousness," proposed by the Norwegian Academy of Sciences at Drontheim. His essay was awarded the prize, and the author elected a member of the society. But proportionate to his exultation in this first recognition of his merit was the depth of his mortification and the height of his indignation at the result of the second competition. He had sent to the Danish Academy at Copenhagen in 1839 an essay "On the Foundations of Morality" in answer to a vaguely worded subject of discussion to which they had invited candidates. His essay, though it was the only one in competition, was refused the prize on the grounds that he had failed to examine the chief problem (*i.e.*, whether the basis of morality was to be sought in an intuitive idea of right), that his explanation was inadequate, and that he had been wanting in due respect to the *summi philosophi* of the age that was just passing. This last reason, while probably most effective with the judges, only stirred up more furiously the fury in Schopenhauer's breast, and his preface is one long fulmination against the ineptitudes and the charlatanism of his *bête noire*, Hegel.

In the essay on the freedom of the will Schopenhauer shows that the deliverance of self-consciousness, "I can do what I will," is a mere statement of our physical freedom, on the sequence of outward act upon inner resolve, in the absence of physical restraint. "The statement of self-consciousness concerns the will merely *a parte vestra*, the question of freedom, on the contrary, *a parte causa*." Self-consciousness throws no light on the relation of volition to its antecedents. If, on the other hand, we turn to the objects of the outer senses, we find that it is part and parcel of their very nature to be not free but necessitated, governed, in short, by the principle of causation. But in the ascending scale of causation cause and effect become more and more heterogeneous, their connexion more unintelligible. This is seen in motivation, especially where the motives are not immediate perceptions but general abstract ideas. It is in the possibility of a concept of motives that man's freedom of choice consists. But, because we can by a feat of abstraction keep an image of one course of action before us and neglect the other concrete conditions of behaviour, there grows up an illusion that the mere mental solicitation or volition might, if we pleased, become actual will. Hence the delusion that we are free to will and not to will. Still the necessitating cause or motive is only the rule under which the real force or radical will operates. In this radical will consists our being, and on it action is consequent: *operari sequitur esse*. By our original character acting in certain circumstances our actions are inevitably determined. But the sense of responsibility for our conduct is not altogether a

delusion. It is really a responsibility for our character, which we have gradually learned experimentally to know, and which so known serves as a count of appeal against single actions, or, in other words, becomes a conscience. That character is the supernatural action of that will which we and all things are. Thus this question of the freedom of the will, which is "a touchstone for distinguishing the profound from the superficial thinker," is solved by the Kantian distinction of empirical and transcendental world. In the words of Malebranche, "La liberté est un mystère."

The essay on the foundation of morality is an attempt to present the fundamental fact of the moral consciousness and to show its metaphysical bearings. It includes a lengthy criticism of Kant's system of ethics as only the old theological morality under a disguise of logical formulae. Kant, according to his critic, though he struck a severe blow at eudæmonism, made the mistake of founding ethics on ideas of obligation and respect, which are meaningless apart from a positive sanction. His categorical imperative is attributed to reason,—a power which we only know as human, but which Kant regards as more than human and borrows from the "rational psychology," which itself had received it from theology. The moral spring should be a reality and a fact of nature, whereas Kant seeks it in the subtleties of general ideas, forgetting that reasoning is one thing and virtue another. And, when Kant has to illustrate the application of his rule for discovering the categorical imperative, he is forced to have recourse to considerations of self-interest.

After this examination, Schopenhauer preludes his exposition by the sceptical survey of so-called virtues, and shows as due that the majority of instances to other than moral motives, and by a disintegration of the average conscience into equal parts of fear of man, superstition, prejudice, vanity, and custom. The misapprehension of human action (as of animal) is egotism, supplemented by the hatred or the malice which arises through egotistic conflicts. But, though these are the predominant springs of conduct, there are cases of unselfish kindness. It is in sympathy, or in our case in we are substituting ourselves for another who is in pain, that we find the impulse which gives an action a truly moral value. The influence of sympathy has two degrees: either it keeps me back from doing wrong to others, and in this sense leads to justice as a moral virtue (whereas civil justice prevents from suffering wrong), or sympathy may carry me on to positive kindness, to philanthropy or love of the human kind. It is in sympathy—the feeling of one identical nature under all the appearance of multiplicity—that the two cardinal virtues of justice and benevolence are based. Schopenhauer notes especially that his principle extends to the relation between man and animals, and that a mistaken conception of human dignity has been allowed to hide the fundamental community of animal nature.

In 1844 appeared the second edition of *The World as Will and Idea*, in two volumes. The first volume was a slightly altered reprint of the earlier issue, the second consisted of a series of chapters forming a commentary parallel to those into which the original work was now first divided. The longest of these new chapters deal with the primacy of the will, with death, and with the metaphysics of sexual love. But, though only a small edition was struck off (500 copies of vol. I and 750 of vol. II), the report of sales which Brockhaus rendered in 1846 was unfavourable, and the price had afterwards to be reduced. Yet there were faint indications of coming recognition of fame, and the eagerness with which each new tribute from critic and admirer was welcomed is both touching and amusing. From 1843 onwards a jurist named F. Dorguth had trumpeted abroad Schopenhauer's name. In 1844 a letter from a Darmstadt lawyer, Joh. August Becker, asking for explanation of some difficulties, began an intimate correspondence which went on for some time (and which was published by Becker's son in 1883). But the chief evangelist (so Schopenhauer styled his literary followers as distinct from the apostles who published not) was Frauenstadt, who made his personal acquaintance in 1846. It was Frauenstadt who succeeded in finding a publisher for the *Parerga and Paralipomena*, which appeared at Berlin in 1851 (2 vols., pp. 465, 531). Yet for this bulky collection of essays, philosophical and others, Schopenhauer received as honorarium only ten free copies of the work. Soon afterwards, Dr E. O. Lindner, assistant editor of the *Vossische Zeitung*, began a series of Schopenhauerite articles. Amongst them may be reckoned

a translation by Mrs Lindner of an article by John Oxenford which appeared in the *Westminster Review* for April 1853, entitled "Iconoclasm in German Philosophy," being an outline of Schopenhauer's system. In 1854 Frauendstadt's *Letters on the Schopenhauerian Philosophy* showed that the new doctrines were become a subject of discussion,—a state of things made still more obvious by the university of Leipzig offering a prize for the best exposition and examination of the principles of Schopenhauer's system. Besides this, the response his ideas gave to popular needs and feelings was evinced by the numerous correspondents who sought his advice in their difficulties. And for the same reason new editions of his works were called for,—a second edition of his degree dissertation in 1847, of his *Essay on Colours* and of *The Will in Nature* in 1854, a third edition of *The World as Will and Idea* in 1859, and in 1860 a second edition of *The Main Problems of Ethics*.

In these later years Schopenhauer had at length realized that peace which can be given in the world, he had become comparatively master of himself. His passions had slackened their strain, and he was no longer the victim of unavailing regrets. As a youth he had known none of those ties which give the individual an *esprit de corps*, a sense of community which he never quite loses. Wandering about from place to place throughout Europe, with no permanent home sweetened by the different phases of family affection, with no reminiscences of comradeship in schoolboy days, with no sentiment of the dues of nationality, Schopenhauer is the fitter interpreter of that modern cosmopolitanism which disdains the more special ties of common life and mutual obligation as being obstacles to free development. In exaggerated self-consciousness, he looks down upon the common herd who live the life of convention and compromise, and puts the supreme value on that higher intellectual life which leisure and means permit him to enjoy. A subtler egoism, which emancipates itself from the lusts and the duties of the world, takes the place of the vulgar self-seeking of the multitude and of the self-devotion of the patriot or philanthropist. To such a mind the friction of professional duties seems irksome, the bonds of matrimony and the duties incumbent on social membership are so many checks on freedom of thought and resolution. The individualist recognizes none of those minor morals and parochial or provincial duties which appropriate three-fourths of our conduct. In the wide universe he sees himself and others, none more akin to him than another, beings not bound by external ties, and united only in the fundamental sameness of their inner nature. To ordinary mortals, absorbed in "the trivial round, the common task," the links that bind individuals are forged by the petty ordinances and observances of society. But to those whom temper and circumstances have denied local and partial associationship, the craving for totality is so keen that it makes them seek their higher country in that far-off world (strangely called "intelligible") where their personality disappears in the one being of the universe. Thus wide is the antagonism between the endemonism of civilization, with aspirations towards perfecting our homes and bodies, so that in all things comfort may be established, and the pessimistic asceticism of Schopenhauer, which sees the perfection of life not in the abundance of those things which we eat and drink and where-with we are clothed but in a deadening of passion, a negation of the would-live-and-enjoy, and an existence in a calm ecstasy of beatific vision, of knowledge not abstract but lively intuition. It is this protest of Schopenhauer against the vanity of the aims prescribed by conventional civilization and enlightenment which has gained him some

of those ardent followers who find in his doctrine that religion of which they stand in need.

It is a religion which owns no connexion with theism, or pantheism. Unlike Spinoza and Hegel and the other leaders of modern speculation, Schopenhauer disdains the shelter of the old theology. His religion is cosmic and secular, it finds its saints in Buddhist and Christian monasticism, in Indian devotees and 19th-century "beautiful souls" and holds the one to be no nearer or more impressive as an example than the other. Of Judaism he has no good to say, its influence on Christianity has been pernicious. The new faith is a ministry of art and of high thinking, which may be rendered by all those who by plain living and unselfish absorption in the great meaning and typical forms of the world have slain the root of bitterness that constantly seeks to spring up within them. It is far from being a worship of the blind force which lies at the back of phenomena. It is a "re-implication" of the individual into the absolute from which life has separated him. Each seeker after this reunion is himself (when he has learnt wisdom by experience and self-restraint) the very being who has become all things, and if the "cosmic will" may be termed God (an impossible identification) then he knows God more intimately than he knows anything else. And here if anywhere it may be said, "He serveth best who loveth best all things both great and small." Yet love in this creed is second to knowledge, the *ada profanum vulgus* of the misanthrope is heard from the solitary's shrine, and instead of the service of humanity we have the contemplation of the eternal forms, and the elevation to that world where self ceases to be separated from other selves, and where, in the ultimate ecstasy of knowledge, all things positive and definite disappear and there is a being which the sensitive soul of man fails to distinguish from non-being.

It is often said that a philosophic system cannot be rightly understood without reference to the character and of the circumstances of the philosopher. The remark finds ample application in the case of Schopenhauer. The conditions of his training, which brought him in contact with the realities of life before he learned the phrases of scholastic language, give to his words the stamp of self-seen truth and the clearness of original conviction. They explain at the same time the naïveté which set a high price on the products his own energies had turned out, and could not see that what was so original to himself might seem less unique to other judges. Pre-occupied with his own ideas, he chafed under the indifference of thinkers who had grown blasé in speculation and fancied himself persecuted by a conspiracy of professors of philosophy. It is not so easy to demonstrate the connexion between a man's life and doctrine. But it is at least plain that in the case of any philosopher, what makes him such is the faculty he has, more than other men, to get a clear idea of what he himself is and does. More than others he leads a second life in the spirit or intellect alongside of his life in the flesh,—the life of knowledge beside the life of will. It is inevitable that he should be especially struck by the points in which the sensible and temporal life comes in conflict with the intellectual and eternal. It was thus that Schopenhauer by his own experience saw in the primacy of the will the fundamental fact of his philosophy, and found in the engrossing interests of the selfish *égoïsme* the perennial hindrances of the higher life. For his absolute individualism, which recognizes in the state, the church, the family only so many superficial and incidental provisions of human craft, the means of relief was absorption in the intellectual and purely ideal aims which prepare the way for the cessation of temporal individuality altogether. But theory is one thing and practice another; and he will often lay most

stress on the theory who is most conscious of defects in the practice. It need not therefore surprise us that the man who formulated the sum of virtue in justice and benevolence was unable to be just to his own kinsfolk and reserved his compassion largely for the brutes, and that the delineator of asceticism was more than moderately sensible of the comforts and enjoyments of life.

Habits of
life

Having renounced what he would call the superstitions of duty to country, to kinsfolk, and to associates, except in so far as these duties were founded on contract (and that, according to him, all duties imply), it was natural that he should take steps to minimize that friction which he so easily excited, and which had induced his voluntary exile from the arena. His regular habits of life and careful regard to his own health remind us of the conduct of the bachelor Kant. He would rise between seven and eight both summer and winter, sponge himself, bathing his eyes carefully, at dawn to coffee prepared by his own hands, and soon get to work. He was a slow reader. The classics were old friends, always revisited with pleasure. He only read original works—the classics of pure literature—avoiding all books about books, and especially eschewed the more modern philosophers. Hume in English and Helvétius and Chamfort in French he found to his mind in their sceptical estimates of ordinary virtue. Mystical and ascetic writings, from Buddhism and the *Upanishads* to Eckhart and the *Deutsche Theologie*, commended themselves by their insistence on the reality of the higher life. Their example of will-force drew his favourable notice to the phenomena of mesmerism, just as his sympathy with the lower brethren of man made him an interested observer of a young orang-outang shown at Frankfurt in 1834. He was familiar with several literatures, English certainly not the least. The names of Shakespeare, Scott, Byron, Calderon, Petrarch, Dante, are frequent in his pages. What he read he tried to read in the original,—or anywhere but in a German translation. Even the Old Testament he found more impressive in the Septuagint version than in Luther's rendering. The hour of noon brought cessation from his contemplations, and for half an hour he soled himself on the flute. At one o'clock he sat down to dinner in his inn, and after dinner came home for an hour's siesta. After some light reading he went out for a stroll, alone, if possible countrywards, with cane in hand, cigar lit, and poodle following. Occasionally he would stop abruptly, turn round or look back, mutter something to himself, so as to leave on the passer-by the impression that he was either crack-brained or angry. Like Kant, he kept his lips closed on principle. His walk over, he retired to the reading-room and studied the *Times*,—for he had been always somewhat of an Anglo-maniac, and had learnt this habit of English life from his father. In winter he would sometimes attend the opera. Between eight and nine he took supper, with a half-bottle of light wine (he avoided his country's beer), at a table by himself.

With his low estimate of the average human being, his sympathies were aristocratic. He left the bulk of his fortune to an institution at Berlin for the benefit of those who had suffered on the side of order during the revolutionary struggles of 1848-49. But in so doing it was not his sympathy with kings but his recognition of the merits of public security which gave the motive to his actions. With all his eulogy of voluntary poverty, he did not agree to being deprived of his property by the malice or cupidity of others, and fears of the loss of his means haunted him not less keenly than other imaginary terrors,—the fancied evils distracting him no less perhaps than would have done those domestic and civil obligations from which he endeavoured to hold himself free. The Nemesis of his social *lâcheté* fell upon him, and, like all solitaires, he

gave an exaggerated importance to trifles, which the sweep of business and customary duty clear away from the ordinary man's memory.

It was not till he was fifty years of age that he set up ^{Personal} rooms and furniture of his own. These abodes he changed ^{details} at Frankfurt about four times, living latterly on the street which runs along the Main. On the mat in his chamber lay his poodle,—latterly a brown dog, which had succeeded the original white one, named Atma (the World-Soul), of which he had been especially fond. These dogs had more than once brought him into trouble with his landlord. In a corner of the room was placed a gilt statuette of Buddha, and on a table not far off lay Duperron's Latin translation of the *Upanishads*, which served as the prayer-book from which Schopenhauer read his devotions. On the desk stood a bust of Kant, and a few portraits hung on the walls. The philosopher's person was under middle size, strongly built and broad-chested, with small hands. His voice was loud and clear, his eyes blue and somewhat wide apart, the mouth full and sensuous, latterly becoming broad as his teeth gave way. The high brow and heavy under-jaw were the evidence of his contrasted nature of ample intellect and vigorous impulses. In youth he had light curly hair, whereas his beard in manhood was of a slightly reddish tint. He always dressed carefully as a gentleman, in black dress-coat and white necktie, and wore shoes. In his later years his portrait was taken more than once, and by several artists, and his bust was modelled somewhat to his own mind in 1859. Reproductions of these likenesses have made familiar his characteristic but unamiable features.

In 1854 Richard Wagner sent him a copy of the *Ring of the Nibelung*, with some words of thanks for a theory of music which had fallen in with his own conceptions. Three years later he received a visit from his old college friend Bunsen, who was then staying in Heidelberg. On his seventieth birthday congratulations flowed in from many quarters. In April 1860 he began to be affected by occasional difficulty in breathing and by palpitation of the heart. Another attack came on in autumn (9th September), and again a week later. On the evening of the 18th his friend and subsequent biographer, Dr Gwinner, sat with him and conversed. On the morning of the 21st September he rose and sat down alone to breakfast; shortly afterwards his doctor called and found him dead in his chair. By his will, made in 1852, with a codicil dated February 1859, his property, with the exception of some small bequests, was devised to the above-mentioned institution at Berlin. Gwinner was named executor, and Frauenstadt was entrusted with the care of his manuscripts and other literary remains.

The philosophy of Schopenhauer, like almost every system of the 19th century, can hardly be understood without reference to the sophy of Kant. Anterior to Kant the gradual advance of idealism from had been the most conspicuous feature in philosophic speculation. Kant to That the direct objects of knowledge, the realities of experience, Schopenhauer were after all only our ideas or perceptions was the lesson of every hauser. thinker from Descartes to Hume. And this doctrine was generally understood to mean that human thought, limited as it was by its own weakness and acquired habits, could hardly hope to cope successfully with the problem of apprehending the real things. The idealist position Kant seemed at first eager to retain with an even stronger force than ever. But it is darkest just before the dawn, and Kant, the Copernicus of philosophy, had really altered the aspects of the doctrine of ideas. It was his purpose to show that the forms of thought (which he sought to isolate from the peculiarities incident to the organic body) were not merely customary means for locking into convenient shape the data of perception, but entered as underlying elements into the constitution of objects, making experience possible and determining the fundamental structure of nature. In other words, the forms of knowledge were the main factor in making objects. By Kant, however, these forms are generally treated psychologically as the action of the several faculties of a mind. Behind thinking there is the thinker. But

in his successors, from Fichte to Hegel, this axiom of the plain man is set aside as antiquated. Thought or conception without a subject-agent appears as the principle—thought or thinking in its universality without any individual substance in which it is embodied. *no more* can the ego be substituted for *no more*. This is the step of advance which is required alike by Fichte when he asks his readers to rise from the empirical ego to the ego which is subject-object (i. e., neither and both), and by Hegel when he tries to substitute the *Begriff* for notion for the *Vorstellung* or pictorial conception. As Spinoza asks us to accept such suspension of ordinary mechanics as permits human bodies to float through the air and part without injury to the members, so if for *no more* the philosophy of Kant's immediate successors requires from the postulant for intuition willingness to reverse his customary beliefs in quasi-material subjects of thought.

But, besides removing the psychological slag which clung to Kant's ideas from their matrix and presenting reason as the active principle in the formation of a universe, his successors carried out with far more detail, and far more enthusiasm and historical scope, his principle that in reason lies the *a priori* or the anticipation of the world, moral and physical. Not content with the barren assertion that the understanding makes nature, and that we can construct science only on the hypothesis that there is reason in the world, they proceeded to show how the thing was actually done. But to do so they had first to bludge away a stone of stumbling which Kant had laid in the way. This was the thing as it was by itself and apart from our knowledge of it,—the something which we know, when and as we know it. This something is what Kant calls a limit-concept. It marks only that we feel our knowledge to be inadequate, and for the reason that there may be another species of sensation than ours, that other beings may not be tied by the special laws of our constitution, and may apprehend, as Plato says, by the soul itself apart from the senses. But this limitation, says the successors of Kant, rests upon a misconception. The sensation of inadequacy is only a condition of growing knowledge in a being subject to the laws of space and time, and the very feeling is a proof of its implicit removal. Look at reason not in its single temporal manifestations but in its eternal operation, and then this universal thought, which may be called God, as the sense-conditioned reason is called man, becomes the very breath and structure of the world. The sense alone being absorbing there is no intelligible residuum of matter: mind is the Alpha and Omega, at once the initial postulate and the final truth of reality.

In various ways a reaction arose against this absorption of everything in reason. In Fichte himself the source of being is primal activity, the groundless and incomprehensible deed-action (*That-Handlung*) of the absolute ego. The innermost character of that ego is an individual in act and effort. "The will is the living principle of reason," says Hegel. "In the last resort," says Schelling (1809), in his *Lectures into the Nature of Human Freedom*, "there is no other being but will. *Willen ist Ursach* (will is primal being), and to this alone apply the predicates fathomless, eternal, independent of time, self-affirming." It is unnecessary to multiply instances to prove that idealism was never without a protest that there is a heart of existence, life, will, action, which is presupposed by all knowledge and is not itself amenable to explanation. We may, if we like, call this element, which is assumed as the basis of all scientific method, irrational,—will instead of reason, feeling rather than knowledge.

It is under the banner of this protest against rationalizing idealism that Schopenhauer advances. But what marks out his argument as its pronounced realism. He fights with the weapons of physical doctrine, the basis of the human, natural earth. He knows no reason but the human, no intelligence save what is exhibited by the animals. He knows that both animals and men have come into existence within assignable limits of time, and that there was an anterior age when no eye or ear gathered the life of the universe into perceptions. Knowledge, therefore, with its vehicle, the intellect, is dependent upon the existence of certain nerve-organs located in the animal organism, and its function is originally only to present an image of the interconnections of the manifestations external to the individual organism, and so to give to the individual in a partial and reflected form that feeling with other things, or innate sympathy, which it loses as organization becomes more complex and characteristic. Knowledge or intellect, therefore, is only the surrogate of that more intimate unity of feeling or will which is the underlying reality—the fount of all existence, the essence of all manifestations, inorganic and organic. And the perfection of reason is attained when man has transcended those limits of individuation in which his knowledge at first presents him to himself, when by art he has risen from single objects to universal types, and by suffering and sacrifice has penetrated to that innermost sanctuary where the enthusiasm of consciousness is reached,—the blessedness of eternal repetition.

In substance the ideas of Schopenhauer may be compared with a more prosaic statement of Mr. Herbert Spencer (modernizing Hume). All psychical states may, according to him, be treated as

incident of the coin-potency between the organism and its environment. In this adjustment the lowest state is taken by reflex action and instinct, where the change of the organs is purely automatic. As the external complexity increases, this automatic adjustment fails, and the organism is thrown upon the initiative. This feeble echo of the full response to stimulus is an impulse, which is thus only another word for impulsive action or adjustment. But gradually this impulsive correspondence is improved, and the idea passes over again into the state of unconscious or organization. Intellect, in short, is only the consequence of misadjustment between stimulus and action. While action is entirely automatic, feeling does not exist. It is only when the creature is partial only, when it does not inevitably and immediately adjust as action, that we have the appearance of intellect in the gap. The chief and fundamental difference between Schopenhauer and Mr. Spencer lies in the refusal of the latter to give this "adjustment" or "automatic action" the name of will. Will according to Mr. Spencer is only another aspect of what is reason, memory, or feeling,—the difference lying in the fact that as will the nascent extinction (ideal motion) is conceived as passing into complete or full motion. But he agrees with Schopenhauer in basing consciousness, in all its forms of reason, feeling or will, upon "automatic movement,—psychical change," from which consciousness emerges and in which it disappears.

What Schopenhauer professed, therefore, is to have dispelled Man the claims of reason to priority and to demonstrate the reality of feeling. He would have science, he would have as a basis for final causation inevitabilities, and its attempts by theories of evolution to find system an historical origin for humanity in rudimentary matter show a misconception of the problem. In the successions of material states there can nowhere be an absolute first. The true origin of man, as of all else, is to be sought in an action which is everlasting and which is ever present, *neque in tempore est causa*. There is a source of knowledge within us by which we know, and more intimately than we can ever know anything external, that we will and feel. That is the first and the highest knowledge, the only knowledge that can strictly be called immediate, and to ourselves we as the subject of will are truly the "immediate object." It is in this sense of will—of will without motives, but not without consciousness of some sort—that reality is revealed. Analogy and experience lead us to assume it to be the same as feeling. But the will means for Schopenhauer, only force. It means a great deal more, and it is his contention that what the scientist calls force is really will. In so doing he is only following the line predicted by Kant¹ and anticipated by Leibnitz. If we wish, said Kant, to give a real existence to the thing in itself or the noumenon we can only do so by investing it with the attributes found in our own internal sense, will, with thinking or something analogous thereto. It is thus that Fichte in his "Lectures on the Essence of Soul" says and planets the same fundamental "soul" as in us—that is, "one simple being which appears to none but itself, in us as elsewhere wherever it occurs self-luminous, dark for every other eye, at the least connecting sensations in itself, upon which, as the grade of soul mounts higher and higher, there is constructed the consciousness of higher and still higher relations." It is thus that Lotze declares "that 'behind the tranquil surface of matter under its rigid and regular habits of behaviour, we are forced to seek the glow of a hidden spiritual activity.' So Schopenhauer, but in a way all his own, finds the truth of things in a will which is indeed unaffected by conscious motives and yet cannot be separated from some faint analogue of non-intellectual consciousness.

In two ways Schopenhauer has influenced the world. He has shown that the usual lucidity of opinion is the spontaneity of that intellect which is so highly lauded, and how overpowering the sway of original will is on all our action. He thus reasserted realism, whose gospel reads, "In the beginning was appetite, passion, will," and has discredited the doctrine belief that ideas have original force of their own. This creed of naturalism is dangerous, and it may be true that the realism it implies can degenerate into cynicism and nihilism. But the demand that there is any virtue and any truth. But in the crash of established creeds and the spread of political indifference and social disintegration it is probably wise, if not always agreeable, to lay bare the wounds under which humanity suffers, though pride would prompt their concealment. But Schopenhauer's theory has another side. If it is dawning realistic, it is no less altruistic in its idealism. The second aspect of his influence is the doctrine of redemption of the soul from its sensual bonds, first by the medium of art and second by the path of renunciation and ascetic life. It may be difficult in each case to draw the line between social duty and individual perfection. But Schopenhauer reminds us that the welfare of society is a temporal and subordinate aim, never to be allowed to dwarf the full realization of our ideal being. Man's duty is undoubtedly to join in the common service of sentient

beings, but his final goal is to rise above the toils and comforts of the visible creature into the vast bosom of a peaceful Nirvana.

Bibliography.—The works of Schopenhauer were published either by death of J. Frauenstädt in 6 volumes (Leipzig, 1874). Besides these, several papers and aphorisms appeared in 1874, also *Schopenhauer's novel of the golden chain*, by the same editor. The best biography of Schopenhauer is that by Gumbel, second and much enlarged edition in 1878. See also Frauenstädt and Lander, *Arthur Schopenhauer*, vol. 1, 2, 3, 4, 5 (1873); O. Buch, *1. Schopenhauer* (1875); K. Peters, *Schopenhauer als Philosoph* (1876); and *Wittenbach und Wittke* (1883); and Krieger, *Schopenhauer's Erbschaft* (1881). A list of works on Schopenhauer is given by Balan, *Schopenhauer-Literatur* (1880). See also *FRANKE*.

SCHROTTER, JOHANN HIERONYMUS (1745-1816), amateur astronomer, principally known by his physical observations of the moon and planets (see OBSERVATORY, under *Lichtenhal*).

SCHUBERT, FRANZ PETER (1797-1828), composer of vocal and instrumental music, was born at Vienna 31st January 1797. For the foundation of his general education he was indebted to his father, a schoolmaster in the Leopoldstadt, but the beauty of his voice attracted so much attention that in 1808 he was received into the choir of the imperial chapel, and during the five years which followed he was taught to sing and to play the violin in the choristers' school called the "Convict." No attempt seems to have been made to teach him composition, but, through the kind intervention of an older chorister, he was supplied with music-paper, and thenceforward he wrote incessantly, as his fancy dictated, without any help whatever, always carefully signing and dating his MSS, which extend back as far as 1810. When his voice broke in 1813 Schubert left the "Convict," and, to avoid the conscription, taught for three years in his father's school. This, however, in nowise damped his zeal for composition. Even at this early period his invention was inexhaustible and the rapidity of his pen almost incredible. In 1815 he composed 2 symphonies, 5 operas, and no less than 137 songs (87 of which have been published), besides a multitude of other important pieces. Yet so little was his genius appreciated that when in 1816 he applied for an appointment at a Government music school, with a salary equal to about twenty guineas a year, he was rejected as "imperfectly qualified."

In 1818 Count Johann Esterházy secured the services of Schubert as resident teacher of music to his daughters, for one of whom the young composer has been supposed—on very insufficient authority—to have entertained a romantic, and of course utterly hopeless, affection. The appointment was of great importance to him, for he was poor, almost to starvation, yet it led to no permanent improvement in his prospects: in fact his life was one long bitter disappointment from beginning to end. He wrote on, year after year, producing music of indescribable beauty in such enormous quantities that but for the dated MSS we should refuse to believe the accounts transmitted to us by his biographers. He wrote because, when his genius inspired him with an idea, he could not refrain. Yet he scarcely ever looked at his compositions after they were finished, and very rarely heard any of them performed. Very little of his dramatic music was given to the world. Two little operettas—*Die Zwillingsbrüder* and *Die Zauberharfe*—barely escaped failure in 1830, and the beautiful incidental music to Madame von Chezy's *Rosamunde* survived but two representations in 1823. Of his greater operas not one was placed upon the stage during his lifetime. With his songs he was more fortunate. Many of them were published, and their fresh bright melodies were irresistible. They were produced by hundreds, and with a rapidity bordering upon the miraculous. Among the MSS seven or eight may be found dated on the same day; yet even in these he never repeated himself: every one was the result of a new inspiration, committed to paper at the moment of conception, laid aside immediately afterwards, and so completely forgotten that

he has been known to ask who was the composer of one of his own *Lieder*, not very long after he had composed it. And this wonderful facility of production led to no unworthy form of treatment. The original MS of *Rock, Hark, the Lark* was written at a "beer-garden," on the back of a bill of fare, the moment after the composer had read the words for the first time, and there are strong reasons for believing that *Who is Sylvia?*—one of the most perfectly finished songs on record—and *Come, thou Monarch of the Yew*, were produced on the same occasion. But the success of the songs did not make Schubert a prosperous man. All his life long he suffered from grinding poverty. Though he received an actual commission to write his greatest dramatic work, *Fervoras*, for the court theatre at Vienna, it was rejected in 1824 for the weakness of its *libretto*. Once, and once only, a chance seemed open to him. He was accepted in 1826 as a candidate for the vacant post of conductor to the court theatre, and requested to compose some music as a test of his powers. At the rehearsal the part he had designed for the prima donna was found too trying for her voice, and he was requested to alter it. "I will alter nothing," said Schubert, and his refusal to listen to reason cost him the coveted appointment.

Of Schubert's ten symphonies not one made its mark during his lifetime, yet the stamp of genius is upon these as plainly as upon his songs. It is true that in works of large dimensions genius loses half its power if unsupported by learning, and Schubert was not learned enough to turn his inspirations to the best account. His ideas came so quickly that the knowledge he possessed was not sufficient to enable him to arrange them in that perfect order which forms the chief charm of the symphonies of Mozart and Beethoven. And the same element of weakness is discernible in his sonatas and other long pieces of chamber music. But these are all true works of genius, precious and imperishable.

It was not to be wondered at that under his heavy trials Schubert's health failed rapidly. After recovering from more than one serious attack of illness, he was seized with a sudden access of delirium while at supper on 13th October 1828, and on 19th November he died, leaving behind him a few clothes and other possessions, which were officially valued at sixty-three Vienna florins (= £2, 10s). His grave at the Ortsriedhof, bought by the scanty savings of his brother Ferdinand, lies within a few feet of that of Beethoven.

Schubert's works, now (1886) in course of publication in a complete series by Messrs Breitkopf & Härtel of Leipzig, include 18 dramatic pieces, 8 secular compositions, 10 symphonies, 34 piano-forte sonatas, a vast collection of songs, of which 457 are already published, and a multitude of other works which are too numerous to mention.

SCHULTENS. Three Dutch Orientalists of this name have an honourable place among the scholars of the 18th century. The first and most important, **ALBERT SCHULTENS** (1686-1750), was born at Groningen in 1686. He studied for the church at Groningen and Leyden, applying himself specially to Hebrew and the cognate tongues. His dissertation on *The Use of Arabic in the Interpretation of Scripture* (1706) indicates the point of view which prevailed with the school of Arabists of which he was founder, and which differentiates his aims from those of *REiske* (qv). After a visit to Reland in Utrecht, he returned to Groningen (1708), then, having taken his degree in theology (1709), he again went to Leyden, and devoted himself to the study of the MS collections there till in 1711 he became pastor at Wassenaar. Parochial work was little to his taste, and in 1713 he took the Hebrew chair at Franeker, which he held till 1729, when he was transferred to Leyden as rector of the *collegium*

theologicum, or seminary for poor students. From 1732 till his death (at Leyden on 26th January 1750) he was professor of Oriental languages at Leyden. Schultens was the chief Arabic teacher of his time, and in some sense a restorer of Arabic studies, but he differed from Reiske and De Sacy in mainly regarding Arabic as a handmaid to Hebrew. His chief work was to vindicate the value of comparative study of the Semitic tongues against those who, like Goussset, regarded Hebrew as a sacred tongue with which comparative philology has nothing to do. Schultens, on the other hand, certainly went much too far in his appeals to Arabic for the interpretation of the Old Testament, the laws of comparative Semitic philology were not yet known, so that the comparison of roots was often guess-work, and the value of the exegetical tradition in Hebrew was not accurately determined. Hence he did not leave so much of permanent value for Hebrew grammar and lexicography as might have been expected from his learning, but the systematic illustration of phrases and modes of thought from Arabic literature, e.g., in his *Libri Jobi*, has a higher value, which has been too much overlooked in the reaction against the extravagances of the school he founded.¹

Albert's son, JOHN JAMES SCHULTENS (1716-1778), became professor at Herborn in 1742, and afterwards succeeded to his father's chair. He was in turn succeeded by his son, HENRY ALBERT SCHULTENS (1749-1793), a man of great parts, who, however, left comparatively little behind him, having succumbed to excessive work while preparing an edition of Meidam, of which only a part appeared posthumously (1795).

SCHULTZE, MAX JOHANN SIEGMUND (1825-1874), German microscopic anatomist, was born at Freiburg in Breisgau (Baden) on 25th March 1825. He studied at Greifswald and Berlin, and was appointed extraordinary professor at Halle in 1854 and five years later ordinary professor of anatomy and histology at Bonn. He died at Bonn 16th January 1874. His contributions to biology were numerous and varied. He founded and edited the important *Archiv für mikroskopische Anatomie*, to which he contributed many papers, and advanced the subject generally, by refining on its technical methods. He also contributed to the knowledge of the *Protozoa* (see FORAMINIFERA, PROTOZOA). He will be longest remembered, however, by his reform of the cell theory. Uniting Dujardin's conception of animal sarcodae with Von Mohl's of vegetable protoplasma, he pointed out clearly their identity, and included them under the common name of protoplasm. He thus reorganized the theory as established by Schwann, diminished the importance of the cell-wall and nucleus, and laid down the modern definition of the cell as "a nucleated mass of protoplasm with or without a cell-wall" (see PROTOPLASM and SCHWANN). An obituary notice of Schultze is given in *Arch. mikr. Anat.*, 1875.

SCHUMACHER, HENRICH CHRISTIAN (1780-1850), astronomer, born at Bramstedt in Holstein, 3d September 1780, was director of the Mannheim observatory from 1813 to 1815, and then became professor of astronomy in Copenhagen. From 1817 he directed the triangulation of Holstein, to which a few years later was added a complete geodetic survey of Denmark, the latter was left incomplete by Schumacher, but was finished after his death. For the sake of the survey an observatory was established at Altona (see OBSERVATORY) and Schumacher resided there permanently, chiefly occupied with the publication

of *Ephemerides* (11 parts, 1822-32) and of the journal *Astronomische Nachrichten*, of which he lived to edit thirty-one volumes, and which still continues to be the principal astronomical journal. Schumacher died at Altona on 28th December 1850.

SCHUMANN, ROBERT (1810-1856), musical critic and composer, was born at Zwickau, Saxony, on 8th June 1810. In deference to his mother's wish, he made a pretence of studying for the law, until he had completed his twentieth year, but in reality he took so little pains to acquaint himself with the mysteries of jurisprudence and so much to master the technical difficulties of the pianoforte that when the day of examination drew near it was evident that he could not hope to pass with credit. His mother therefore wisely gave up her cherished project, and in the summer of 1830 permitted him to settle for a time in Leipzig that he might receive regular instruction from Friedrich Wieck, the most accomplished and successful teacher of the pianoforte then living in North Germany. Under Wieck's superintendence Schumann would doubtless have become a pianist of the highest order had he not endeavoured to strengthen the third finger of his right hand by some mechanical contrivance the secret of which he never clearly explained. But the process failed most signally, and the hand became so hopelessly crippled that the young artist was compelled to give up all thought of success as a performer and to devote himself thenceforward to the study of composition, which he cultivated diligently under the guidance of Heinrich Dorn.

This change of purpose led him to direct his attention to subjects connected with the higher branches of art which he had previously very much neglected. Moreover, it gave him time and opportunity for the development of a peculiar talent which he soon succeeded in turning to excellent account,—the talent for musical criticism. His first essays in this direction appeared in the form of contributions to the *Allgemeine musikalische Zeitung*, but in 1834 he started a journal of his own, entitled *Die Neue Zeitschrift für Musik*, and to this from time to time he contributed critiques of the most profound character, sometimes openly written under his own name, sometimes ostensibly emanating from an imaginary brotherhood called the *Davidsbund*, the members of which were living men and women, Schumann's most intimate friends, though the society itself existed only in his own fertile imagination. His time was now fully occupied. He composed with inexhaustible ardour, and by the exercise of his extraordinary critical faculty struck out for himself new paths, which he fearlessly trod without a thought of the reception his works were likely to meet with from the public. The habit of passing a just judgment upon the works of others led him to judge his own productions with relentless severity, and it may be safely said that he was harder upon himself than upon any candidate for public favour whose attempts he was called upon to criticize.

Schumann's first great orchestral work was his *Symphony in B♭*, produced in 1841,—the year after his marriage with Clara Wieck, now so well known to the world as Madame Clara Schumann, the accomplished pianiste, to whose faultless interpretation of her husband's works we are indebted for our fullest appreciation of their inherent beauty. Another symphony, in D minor, and an orchestral overture, scherzo, and finale, appeared in the same year, and from this time forward works on an equally grand scale appeared in rapid succession, culminating with his first and only opera, *Genoveva*, which, though completed in 1848, was not produced until 1850. In 1843 Schumann was appointed professor of composition in Mendelssohn's newly founded conservatory of music at Leipzig. Two years after Mendelssohn's death he endeavoured to obtain the appoint-

¹ A. Schultens's chief works are *Origines Hebraeae* (2 vols., 1724, 1738), 2d ed., 1761; with the *De defectibus lingue Hebraeae* (1st ed., 1761), *Com. on Job*, 1737; *Com. on Proverbs*, 1748; *Hebrew grammar* (*Inductiones*), 1737; *Tejus et regna via Hebraeorum*, 1738; *Monumenta veteris Arabum* (1740)—extracts from Nowairi, Mas'udi, &c.; ed. of Beha-ed-din's *Life of Saladin*, his *Opera Minora* (1769) and a *Sylloge Dissertationum* (1772, 1775) appeared posthumously.

ment of director of the Gewandhaus concerts, but was rejected in favour of J. Rietz. In 1850 he was invited to Düsseldorf as musical director—a post in which Mendelssohn had greatly distinguished himself many years previously. Schumann retained this until 1853, when his mental powers began to decline rapidly through a disease of the brain from which he had long suffered, and of which he died at Emden, near Bonn, 29th July 1856.

Schumann's position in the history of German music is very important and marks the last stage but one of its progress towards its present condition. His style was very advanced and strikingly original. His published works include one opera, four symphonies, orchestral works written on a very extensive scale, and a large quantity of songs, pianoforte pieces, and other smaller works of the highest excellence and beauty.

SCHWABE, SAMUEL HEINRICH (1789-1875), German amateur astronomer, was born on 25th October 1789 at Dessau, where he died on 11th April 1875; he observed the sun-spots regularly from 1826 and pointed out (in 1843) the periodicity in the number of these objects.

SCHWALBACH, or LANGENSCHWALBACH, a favourite German health resort, in the Prussian province of Hesse-Nassau, is pleasantly situated in the deep valley of the Munzenbach near its junction with the Aar, 12 miles north-west from Wiesbaden, with which it has regular communication by diligence. Besides a large kursal, the town has four churches, a synagogue, a real school, and a higher school for girls. The three principal springs, which are largely impregnated in varying proportions with iron and carbonic acid (compare MINERAL WATERS), are connected by promenades. The permanent population of the town was 2811 in 1880, and the number of visitors reaches about 5000 annually.

About 4½ miles to the south of Schwalbach is **SCHLANGENBAD** (360 inhabitants), the thermal springs of which are efficacious in nervous complaints and attract about 2000 visitors (chiefly ladies) every year. The water is used externally only.

SCHWANN, THEODORE (1810-1882), author of the cell theory in physiology, was born at Neuss in Rhemish Prussia on 7th December 1810. His father was a man of great mechanical talents; at first a goldsmith, he afterwards founded an important printing establishment. Schwann inherited his father's mechanical tastes, and the leisure of his boyhood was largely spent in constructing little machines of all kinds. He studied at the Jesuits' college in Cologne and afterwards at Bonn, where he met Johannes Müller, in whose physiological experiments he soon came to assist. He next went to Würzburg to continue his medical studies, and thence to Berlin to graduate in 1834. Here he again met Müller, who had been meanwhile translated to Berlin, and who finally persuaded him to enter on a scientific career and appointed him assistant at the anatomical museum. Schwann in 1838 was called to the chair of anatomy at the Roman Catholic university of Louvain, where he remained nine years. He then went as professor to Liège, where, in spite of brilliant offers from many German universities, he led a very quiet uneventful life, broken only by the international commemoration of the fortieth anniversary both of his professorate and the publication of his *magnum opus*, till his death on 11th January 1882. He was of a peculiarly gentle and amiable character and remained a devout Catholic throughout his life.

It was during the four years spent under the influence of Müller at Berlin that all Schwann's really valuable work was done. Müller was at this time preparing his great book on physiology, and Schwann assisted him in the experimental work required. His attention being thus directed to the nervous and muscular tissues, besides making such histological discoveries as that of the envelope of the nerve-fibres which now bears his name, he initiated those researches in muscular contractility since so elaborately worked

out by Du Bois Reymond and others. He was thus the first of Müller's pupils who broke with the traditional vitalism and worked towards a physico-chemical explanation of life. Müller also directed his attention to the process of digestion, which Schwann showed to depend essentially on the presence of a ferment called by him pepsin, thus not only practically bringing the subject up to its modern state but preparing for the subsequent advances in medical treatment made by Roberts. Schwann also examined the question of spontaneous generation, which he aided greatly to disprove, and in the course of his experiments discovered the organic nature of yeast. His theory of fermentation was bitterly attacked and ridiculed by Liebig, but has been, after the lapse of a quarter of a century, triumphantly confirmed. In fact the whole germ theory of Pasteur, as well as the antiseptic application of Lister, is thus traceable to the influence of Schwann. Once when dining with Schläden, in 1837, the conversation turned on the nuclei of vegetable cells. Schwann remembered having seen similar structures in the cells of the notochord (as had been shown by Müller) and instantly seized the importance of connecting the two phenomena. The resemblance was confirmed without delay by both observers, and the results soon appeared in the famous *Microscopic Investigations on the Accordance in the Structure and Growth of Plants and Animals* (Berlin, 1839, trans. Sydenham Society, 1847), and the cell theory (see MORPHOLOGY) was thus definitely constituted. In the course of his verifications of the cell theory, in which he traversed the whole field of histology, he proved the cellular origin and development of the most highly differentiated tissues, nails, feathers, enamels, &c. Although mistaken in his view of the origin of new cells, his generalization at once became the foundation of all modern histology, and in the hands of Virchow (whose cellular pathology is an inevitable deduction from Schwann) has afforded the means of placing modern pathology on a truly scientific basis.

An excellent account of Schwann's life and work is that by Leon Frédéricq (Louvain, 1884).

SCHWANTHALER, LUDWIG MICHAEL (1802-1848), German sculptor, was born in Munich on 26th August 1802. His family had been known in Tyrol by its sculptors for three centuries, young Ludwig received his earliest lessons from his father, and the father had been instructed by the grandfather. The last to bear the name was Xaver, who worked in his cousin Ludwig's studio and survived till 1854. For successive generations the family lived by the carving of busts and sepulchral monuments, and from the condition of mechanics rose to that of artists.

From the Munich gymnasium Schwantthaler passed as a student to the Munich academy, at first he purposed to be a painter, but afterwards reverted to the plastic arts of his ancestors. His talents received timely encouragement by a commission for an elaborate silver service for the king's table. Cornelius also befriended him, the great painter was occupied on designs for the decoration in fresco of the newly erected Glyptothek, and at his suggestion Schwantthaler was employed on the sculpture within the halls. Thus arose between painting, sculpture, and architecture that union and mutual support which characterized the revival of the arts in Bavaria. Schwantthaler in 1826 went to Italy as a pensioner of King Louis, and on a second visit in 1832 Thorwaldsen gave him kindly help. His skill was so developed that on his return he was able to meet the extraordinary demand for sculpture consequent on King Louis's passion for building new palaces, churches, galleries, and museums, and he became the fellow-worker of the architects Klenze, Gärtner, and Ohlmüller, and of the painters Cornelius, Schnorr, and Hess. Owing to the magnitude and multitude of the plastic products they turned out, over-pressure and haste in design and workmanship brought down the quality of the art. The works of Schwantthaler in Munich are so many and miscellaneous that they can only be briefly indicated. The new palace is peopled with his statues: the throne-room has twelve imposing gilt bronze figures 10 feet high, the same palace is also enriched with a frieze and with sundry other decorations modelled and painted from his drawings. The sculptor, like his contemporary painters, received help from trained pupils. The same prolific artist also furnished the old Pinakothek with twenty-five marbles, commemorative of as many great painters, likewise he

supplied a composition for the pediment of the exhibition building facing the Glyptothek, and executed sundry figures for the public library and the hall of the marshal. Sacred art lay outside his ordinary routine, yet in the churches of St Ludwig and St Mariahilf he gave proof of the widest versatility. The Ruhme-halle afforded further gauge of unexampled power of production, here alone is work which, if adequately studied, might have occupied a lifetime, ninety-two metopes, and, conspicuously, the giant figure of Bavaria, 60 feet high, rank among the boldest feats of physical force. A short life of forty-six years did not permit serious undertakings beyond the Bavarian capital, yet time was found for the groups within the north pediment of the Walhalla, Ratisbon, and also for numerous portrait statues, including those of Mozart, Jean Paul Richter, Goethe, and Shakespeare. Schwanthaler died at Munich in 1848, and left by will to the Munich academy all his models and studies, which now form the Schwanthaler Museum. The sculptor's style may be designated as romantic-classic or modern-antique, and its conventional ideal stands far removed from the schools of naturalism and of realism.

SCHWARZ, or **SCHWARTZ**, **CHRISTIAN FRIEDRICH** (1726-1798), Protestant missionary to India, was born on 8th October 1726 at Sonnenburg, in the electorate of Brandenburg, Prussia. After attending the grammar school of his native town and an academy at Kustrin, he in 1746 entered the university of Halle. Having learned Tamil to assist in a translation of the Bible into that language, he was led to form the intention of becoming a missionary to India. He received ordination at Copenhagen on the 8th August 1749, and, after spending some time in England to acquire the English language, embarked early in 1750 for India, and arrived at Trichinopoly on the 30th July. Tranquebar was for some time his headquarters, but he paid frequent visits to Tanjore and Trichinopoly, and in 1766 removed to the latter place. Here he acted as chaplain to the garrison, who erected a church for his general use. In 1769 he secured the friendship of the rajah of Tanjore, who, although he never embraced Christianity, afforded him every countenance in his missionary labours. Shortly before his death he committed to Schwarz the education of his adopted son and successor. In 1779 Schwarz undertook, at the request of the Madras Government, a private embassy to Hydr Ali, the chief of Mysore. When Hydr invaded the Carnatic, Schwarz was allowed to pass through the enemy's encampment without molestation. After twelve years in Trichinopoly he removed to Tanjore, where he spent the remainder of his life. He died on 13th February 1798. Schwarz's direct success in making converts exceeded that of any other Protestant missionary in India, in addition to which he succeeded in winning the esteem of Mohammedans and Hindus. The rajah of Tanjore erected a monument, executed by Flaxman, in the mission church, in which he is represented as grasping the hand of the dying missionary and receiving his benediction. A splendid monument to Schwarz by Bacon was placed by the East India Company in St Mary's church at Madras.

See *Remains of Schwarz*, with a sketch of his life, 1826, *Memoirs of Life and Correspondence*, by H. N. Pearson, 1884, 8d ed. 1889, 1/6s, by H. N. Pearson, 1885.

SCHWARZBURG-RUDOLSTADT, a small Thuringian principality and an independent member of the German empire, shares with Schwarzburg-Sondershausen the possessions of the old house of Schwarzburg, consisting of the upper barony (Oberherrschaft) in Thuringia, on the Gera, Ilm, and Saale, and the lower barony (Unterrherrschaft), an isolated district on the Wipper and Helbe, about 25 miles to the north, surrounded by the Prussian province

of Saxony. See plate V. As the dignity of prince is held in virtue of the Oberherrschaft alone, a share of both baronies was given to each sub-line of the main house. The total area of Schwarzburg-Rudolstadt is 363 square miles, of which 283 are in the upper and 80 in the lower barony, the chief towns in the former district are Rudolstadt (8747 inhabitants), the capital, and Blankenburg (1889), and in the latter Frankenhäusen (4985). Both baronies are hilly, but no great height is anywhere attained. The scenery of the Thuringian portion of Schwarzburg-Rudolstadt attracts many visitors annually, the most beautiful spots being the gorge of the Schwarzra and the lovely circular valley in which the village of Schwarzburg nestles at the foot of a curiously isolated hill, crowned by the ancient castle of the princely line. Cattle-rearing and fruit-growing flourish in the lower barony, while the upper barony is finely wooded. Of the whole country 44 per cent is under forest (mainly coniferous trees), and 41 per cent is devoted to agriculture. The chief grain crops are rye, oats, and barley, but in 1883 thrice as much ground was occupied by potatoes as by all these three together. The live-stock returns in 1883 showed 19,831 cattle, 39,024 sheep, 19,544 pigs, 14,420 goats, and 2813 horses. Agriculture and forestry support about 35 per cent of the population, and mining and cognate industries about 10 per cent. Trade and manufactures are insignificant; iron, lignite, cobalt, alum, and vitriol are among the mineral productions. In 1880 the population was 80,296 (an increase of 1779 since 1875), or about 221 to the square mile. Of these 79,832 were Protestants.

Schwarzburg-Rudolstadt is a limited hereditary sovereignty, its constitution resting on laws of 1854 and 1870, though a diet has met at intervals since 1816. The present diet consists of sixteen members elected for six years, four chosen by the highest taxpayers, the others by general election. The diet must be summoned every three years. The budget for 1885-87 estimated revenue and expenditure each at £101,210, £87,670 was the estimated income from the public lands and forests. The public debt was £230,355. The troops of Schwarzburg-Rudolstadt have been incorporated with the Prussian army since the convention of 1867. The principality has one vote in the Reichstag and one in the federal council.

Schwarzburg-Rudolstadt is the elder branch of the family. In 1710 the count was made a prince, in spite of the remonstrances of the elector of Saxony, although he was prevented from taking his seat in the imperial college until 1751. The principality entered the Confederation of the Rhine in 1807 and the German League in 1815. In 1819 it redeemed the Prussian claims of superiority by surrendering portions of its territory.

SCHWARZBURG-SONDERSHAUSEN, a small Thuringian principality and an independent member of the German empire, shares the old Schwarzburg lands with Schwarzburg-Rudolstadt, as explained in the preceding article. Its total area is 533 square miles, of which 133 are in the upper and 200 in the lower barony. The chief towns are Arnstadt (10,516 inhabitants), which at one time gave name to a line of counts, in the latter district, and Sondershausen (6110), the capital, in the former. The general description of the nature and resources of Schwarzburg-Rudolstadt applies also to this principality, except that 58 per cent of the whole is devoted to agriculture and 30 per cent to forests, only about two-fifths of which are coniferous trees. The chief crops are oats, barley, wheat, and rye; but here also by far the most land is planted with potatoes. In 1883 the principality contained 21,205 cattle, 54,276 sheep, 22,884 pigs, 11,372 goats, and 4283 horses. About 39 per cent of the population are supported by agriculture and forestry, and about 5 per cent by mining. In 1880 the population was 71,107 (an increase of 3627 since 1875), or about 213 to the square mile. Of these 70,450 were Protestants.

Schwarzburg-Sondershausen is a limited hereditary sovereignty, its constitution resting on a law of 1857. The diet consists of five representatives elected by the highest taxpayers, five by general election, and not more than five nominated for life by the prince.

The first ten members are elected for four years, which is also the financial period. There is a ministry with five departments—for the prince's household, domestic affairs, finance, churches and schools, and justice. The budget for each year in the period 1854-57 estimated the income at £112,475 and the expenditure at £1000 less. The public debt in 1855 was £169,625. The troops of Schwarzburg-Sonderhausen have been incorporated with the Prussian army by convention since 1857. The principality has one vote in the Reichstag and one in the federal council.

The house of Schwarzburg is one of the oldest and noblest in Germany, and tradition traces its descent from Witkind and the kings of the Franks. Its historical ancestors were the counts of Kalenberg, from whom the counts of Schwarzburg sprang about the beginning of the 11th century. The name Gunther became the distinctive name for the members of this house (corresponding to Heinrich in the Reuss family), the various Gunthairs being at first distinguished by numbers and afterwards by prefixed names. Various subdivisions and collateral lines were formed, but by 1599 all were extinct but the present two. Count Gunther XL, who died in 1552, was the last common ancestor of both lines. Schwarzburg-Sondershausen is the senior line, although its possessions are the smaller. In 1607 the count was raised to the dignity of imperial prince by the emperor, Leopold I. The prince had to pay 7000 thalers, to the elector of Saxony and 3500 to the duke of Saxe-Weimar, and numerous disputes arose in connexion with the superintendence thus indicated. In 1607 Schwarzburg-Sondershausen entered the Confederation of the Rhine and became a sovereign state. In 1816 it joined the German League, and ceded with portions of its territory all rights of superiority claimed by Prussia. Its domestic government has gradually, though not very quickly, improved since that time,—the oppressive gabelle-laws in particular having been abolished. A treaty of mutual succession was made between the two families in 1718.

SCHWARZENBERG, KARL PHILIPP, PRINCE OF (1771-1820), Austrian field-marshal, was born on 15th April 1771 at Vienna. He fought in 1789 under Lacy with distinction against the Turks and became major in 1792. In the French campaign of 1793 he held command of a portion of the advanced guard under the duke of Coburg, and in 1794 his impetuous charge at the head of a cavalry regiment greatly contributed to the victory of Cateau-Cambrésis. After the battle of Wurmberg in September 1796 he was raised to the rank of major-general, and in 1799 to that of field-marshal in command of a division. At the defeat of Hohenlinden in 1800 his promptitude and courage saved those under his command from being surrounded and taken prisoners. In the war of 1805 he held command of a division under General Mack, and when Ulm capitulated to Napoleon in October he cut his way through the hostile lines with some cavalry regiments. At the special request of the emperor Alexander he undertook an embassy to St Petersburg in 1808, but two days before the battle of Wagram he arrived in the camp and assumed command as general of the cavalry. After the peace of Vienna he was sent to Paris to negotiate a marriage between Napoleon and the duchess Maria Louisa. From this time he secured Napoleon's special confidence and esteem, and at his request took command of the Austrian auxiliary corps in the Russian campaign. In August he received the command of the seventh or Saxon army corps, after gaining some slight advantages over the Russians, he was compelled to retreat before superior forces to the duchy of Warsaw, where, according to instructions from Napoleon, he remained for some months inactive at Pultusk. In 1813 he was appointed commander-in-chief of the allied forces, and, after defeating Napoleon at Leipzig in October, carried the campaign to a successful issue by entering Paris in March 1814. On the conclusion of the war he became president of the Aulic Council. He died from paralysis at Leipzig on 15th October 1820.

SCHWEGLER, ALBERT (1819-1857), historical, philosophical, and theological writer, one of the first and most distinguished of the pupils of F. C. Baur and of the *des minores* of the Tübingen school. He was born at Michel-

bach in Württemberg on 10th February 1819, the son of a country clergyman, and entered the university of Tübingen in 1836 as a student of theology, though with a predominant liking for classical philology. Under Baur's influence he devoted himself to the study of ecclesiastical history, and his first work was *Der Montanismus u die christliche Kirche des 2ten Jahrhunderts* (1841), in which he was the first to point out that Montanism was much more than an isolated outbreak of eccentric fanaticism in the early church, though he introduced fresh misconceptions by connecting it with Ebionitism as he conceived the latter. This work, with other essays, brought Schwegler into conflict with the authorities of the church, in consequence of which he gave up theology as his professional study and chose that of philosophy. In 1843 he commenced in the Tübingen university the career of a teacher (*privat-docent*) of philosophy and classical philology, and in 1848 was made extraordinary professor of the latter subject and soon after ordinary professor of history. His death took place on 5th January 1857.

His principal theological work was *Das nachapostolische Zeitalter* (2 vols., 1848). It was this book which first put before the world, with Schwegler's characteristic boldness and clearness, the results of the critical labours of the earlier Tübingen school in relation to the first development of Christianity. Carl Schwarz says of it, "This work—full though it was of youthful exaggerations and provocations, partisan as it was in its line of argument, untrue and abstract as its contrast of Paulinism and Petrinism was, and arbitrary as was its use of those party names—produced nevertheless by its masterly literary form (which reminds us of Stausius), and by its easy handling and presentation of all the important data, a powerful impression, and, although in many points of detail it is out of date, it may still be regarded as one of the 'standard works' of the school." Schwegler published also an edition of the *Clementine Homilies* (1847), and of Eusebius's *Ecclesiastical History* (1852). In the department of philosophy we have an edition of the *Metaphysics* of Aristotle, with a translation and commentary (4 vols., 1847-48), the well-known sketch of the *History of Philosophy* (1848), and a posthumous *Geschichte der Griech. Philosophie* (1859). In history he commenced a *Römische Geschichte* (vols. 1-III., 1858-59, 2d ed., 1869), which he brought down only to the laws of Licinius.

SCHWEIDNITZ, a manufacturing and trading town of Lower Silesia in Prussia, is picturesquely situated on the left bank of the Weistritz, 28 miles south-west of Breslau. Well built, with wide streets, the town contains several old churches (one of which has a tower 338 feet high) and an ancient town-house with a tower 180 feet high. The surrounding country is fertile and highly cultivated, and the large quantities of flax and hemp there raised encourage an active weaving industry in the town. Beetroot for sugar, grain, and fruit are also grown. The manufacture of furniture, leather gloves, machinery and tools, carriages, nuts and screws, needles, and other hardware goods is carried on. The beer of Schweidnitz has long been famous under the name of "Schwarze Schöps," and in the 16th century it was exported as far as Italy. Schweidnitz is the chief grain market of the district. The population in 1885 was 23,775 (an increase of 6 per cent since 1880); in 1816 it was 10,046.

Schweidnitz, dating from about the 11th century, received town rights in 1250. About 1278 it became the capital of a principality, with an area of 935 square miles, which belonged to Bohemia from 1353 till 1741, when it passed into the possession of Prussia. The "Polera of Schweidnitz" is the name given to the notorious revolt of the town, in 1520-22, against a royal edict depriving it of the right of coining its own money. The town was four times besieged and taken in the Seven Years' War, and in 1807 it was captured by the French, who demolished the fortifications. In 1816 new works were raised, but in 1864 they were converted into a public park.

SCHWEINFURT, a manufacturing town of Lower Franconia in Bavaria, is situated on the right bank of the Main, 22 miles north-east of Würzburg. The Renaissance town-house in the spacious market-place dates from 1570;

it contains a library and a collection of antiquities. St John's church is a Gothic edifice with a lofty tower. St Salvator's was built about 1720. Schweinfurt is well furnished with benevolent and educational institutions, including a gymnasium founded by Gustavus Adolphus. The Main is here spanned by two bridges. The chief manufacture is paint ("Schweinfurt green" is a well-known brand in Germany), introduced in 1809, but beer, sugar, machinery, soap and other dysalateries, straw-paper, vinegar, &c., are also produced. Cotton-spinning and bell-founding are carried on, and the Main supplies water-power for numerous saw, flour, and other mills. Schweinfurt carries on an active trade in the grain, fruit, and wine produced in its neighbourhood, and it is the seat of an important sheep and cattle market. Ruckert the poet (d 1866) was born here in 1788. The population in 1880 was 12,601, of whom one-fourth were Roman Catholics.

Schweinfurt is mentioned in 790, and in the 10th century was the seat of a margrave. It fell later to the counts of Henneberg, but, reserving town rights in the 13th century, it maintained its independence as a free imperial city with few interruptions until 1803, when it passed to Bavaria. Assigned to the grand-duke of Würzburg in 1810, it was restored to Bavaria in 1814. In the Thirty Years' War it was occupied by Gustavus Adolphus, who erected fortifications, remains of which are still extant.

SCHWELM, a town of Westphalia, in Prussia, is situated on the river of the same name, 22 miles east of Düsseldorf and 27 north-east of Cologne. Lying close to the Harkort iron and sulphur mines, within the populous and rich mineral district on the lower Rhine, it carries on iron-founding, wire-drawing, and the manufacture of machinery of various kinds, besides an active trade in iron, steel, and brass goods. Scarcely less important are its manufactures of ribbons, damask, cord, and paper. In the neighbourhood are chalybeate springs, resorted to by invalids. The population in 1880 was 12,127, one-fourth of whom were Roman Catholics. Schwelm is said to have existed as early as 1085, though it did not receive town-rights until 1590.

SCHWENKFELD, CASPAR (1490-1561), of Ossing, as he called himself from his property at this place in the principality of Liegnitz in Silesia, one of the first and noblest representatives of Protestant mysticism in the 16th century, was born in 1490. He was of noble descent, and acquired at Cologne and other universities an education greatly superior to that possessed by most noblemen of his time. After leaving the university he served in various minor courts of Silesia, finally entering the service of the duke of Liegnitz, over whom his influence was great. Though he was educated as a strict Catholic, the writings of Tauler and Luther produced a profound impression upon him, so that in 1522 he visited Wittenberg, where he made the acquaintance of Carlstadt and Thomas Munzer, spirits destined to be more congenial to him than Luther himself. On his return to Liegnitz he joined in an active propagation of the principles of the Reformation in the principality and in Silesia. But very early Schwenkfeld uttered warnings against the abuse of the doctrine of justification by faith. The Protestant controversy as to the Eucharist (1524) revealed his disagreement with Luther on that critical point. He sought to establish a *via media* between the doctrines of Luther and Zwingli, and vainly hoped to obtain for it Luther's acceptance. He as vainly sought to secure Luther's adoption of a strict rule of church discipline, after the manner of the Moravian Brethren. Meanwhile the Anabaptists obtained a footing in Silesia, and suspicions of Schwenkfeld's sympathy with them were aroused. Letters and writings of his own (1527-28) proved him to hold strongly anti-Lutheran heresies, and both Catholics and Lutherans urged the duke of Liegnitz to dismiss him. He voluntarily left Liegnitz in 1529, and

took up his abode at Strasburg for five years amongst the numerous Reformed clergy there. In 1533, in an important synod, he defended against Bucer the principles of religious freedom as well as his own doctrine and life. But the heads of the church carried the day, and, in consequence of the more stringent measures adopted against dissenters, Schwenkfeld left Strasburg for a time. While residing in various cities of south Germany he kept up a wide correspondence with the nobility particularly, and in Wuttemberg propagated his views personally at their courts. In 1535 a sort of compromise was brought about between himself and the Reformers, he promising not to disturb the peace of the church and they not to treat him as a disturber. The compromise was of only short duration. His theology took a more distinctly heterodox form, and the publication (1539) of a book in proof of his most characteristic doctrine—the deification of the humanity of Christ—led to the active persecution of him by the Lutherans and his expulsion from the city of Ulm. The next year (1540) he published a refutation of the attacks upon his doctrine with a more elaborate exposition of it, under the title *Grosse Confession*. His book was very inconvenient to the Protestants, as it served to emphasize the differences between the Lutherans and Zwinglians as regarded the Eucharist at a moment when efforts were being made to reconcile them. An anathema was accordingly issued from Schmalkald against Schwenkfeld (together with Sebastian Franck); his books were placed on the Protestant "index"; and he himself was made a religious outlaw. From that time he was hunted from place to place, though his wide connexions with the nobility and the esteem in which he was held by numerous followers and friends provided for him secure hiding-places and for his books a large circulation. An attempt in 1543 to approach Luther only increased the Reformer's hostility and rendered Schwenkfeld's situation still more precarious. He and his followers withdrew from the Lutheran Church, declined its sacraments, and formed small societies of kindred views. He and they were frequently condemned by Protestant ecclesiastical and political authorities, especially by the Government of Wuttemberg. His personal safety was thereby more and more imperilled, and he was unable to stay in any place for more than a short time. At last, in his seventy-second year, he died at Ulm, on 10th December 1561, surrounded by attached friends and declaring undiminished faith in his views.

Schenkfeld left behind him a sect (who were called subsequently by others Schwenkfeldians, but who called themselves "Confessors of the Glory of Christ") and numerous writings to perpetuate his ideas. His writings were partially collected in four folio volumes, the first of which was published in the year 1664, containing his principal theological works. Birkham states that his unpurged writings would make more than another four folios. His adherents were to be found at his death scattered throughout Germany in Silesia they formed a distinct sect, which has lasted until on own times. In the 17th century they were associated with the followers of Jacob Bohme, and were undisturbed until 1708, when an inquiry was made as to their doctrines. In 1720 a commission of Jesuits was despatched to Silesia to convert them by force. Most of them fled from Silesia into Saxony, and thence to Holland, England, and North America. Frederick the Great of Prussia, when he seized Silesia, extended his protection to those who remained in that province. Those who had fled to Philadelphia in Pennsylvania formed a small community under the name of Schwenkfeldians, and Zundendorf and Spangenberg, when they visited the United States, endeavoured, but with little success, to convert them to their views. This community still exists in Pennsylvania, and according to information obtained from their ministers by Robert Barclay they consisted in 1875 of two congregations of 600 members, with three meeting-houses and six ministers. Their views appear to be substantially those of the English Society of Friends. See Robert Barclay's *Inner Life of the Religious Societies of the Commonwealth*, London, 1876, pp. 226-247.

Schenkfeld's mysticism was the cause of his divergence from Protestant orthodoxy and the root of his peculiar religious and

theological position. It led him to oppose the Lutheran view of the value of the outward means of grace, such as the ministry of the word, baptism, the Eucharist. He regarded as essential a direct and immediate participation in the grace of the glorified Christ, and looked on an observance of the sacraments and religious ordinances as immaterial. He distinguished between an outward word of God and an inward, the former being the Scripture and perishable, the latter the divine spirit and eternal. In his Christology he departed from the Lutheran and Zwinglian doctrine of the two natures by insisting on what he called the *Vergottung des Fleisches Christi*, the deification or the glorification of the flesh of Christ. The doctrine was his protest against a separation of the human and the divine in Christ, and was intimately connected with his mystical view of the work of Christ. He held that, though Christ was God and man from His birth from the Virgin, He only attained His complete deification and glorification by His ascension, and that it is in the estate of His celestial *Vergottung* or glorification that He is the dispenser of His divine life to those who by faith become one with Him. This fellowship with the glorified Christ rather than a less spiritual trust in His death and atonement is with him the essential thing. His peculiar Christology was based upon profound theological and anthropological ideas, which contain the germs of some recent theological and Christological speculations.

Theol.* (1867), also Erbikam's article in *Herzog's Realencyclopädie*, Robert Barclay's work quoted above, and Beard's *Lives of the Saints* (1855).

SCHWERNIN, the capital and one of the most attractive cities of the grand-duchy of Mecklenburg-Schwernin, is prettily situated at the south-west corner of the Lake of Schwerin (14 miles long and 3½ miles broad), 110 miles north-west of Berlin. The town is closely surrounded and hemmed in by a number of lakelets, with high and in some cases well-wooded banks; and the hilly environs are occupied by meadows, woods, and pretty villas. The old and new towns of Schwerin were only united as one city in 1832, and since that date the suburb of St Paul and another outer suburb, known as the Vorstadt, have grown up. Though Schwerin is the oldest town in Mecklenburg, its aspect is comparatively modern,—a fact due to destructive fires, which have swept away most of the ancient houses. The most conspicuous of the many fine buildings is the ducal palace, a huge irregularly pentagonal structure with numerous towers (the highest 236 feet), built in 1844-57 in the French Renaissance style. It stands on a small round island between Castle Lake and the Lake of Schwerin, formerly the site of a Wendish fortress and of a later mediæval castle, portions of which have been skilfully incorporated with the present building. The older and much simpler palace; the opera-house, rebuilt after a fire in 1882; the Government buildings, erected in 1825-34 and restored in 1865 after a fire, and the museum, in the Greek style, finished in 1882, all stand in the "old garden," an open space at the end of the bridge leading to the new palace. Among the other secular buildings are the palace of the hereditary prince (built in 1779 and restored in 1878), the large arsenal, the ducal stables, the gymnasium, the town-house, the artillery-barracks, the military hospital, &c. The cathedral was originally consecrated in 1248, though the present building—a brick structure in the Baltic Gothic style, with an unfinished tower—dates for the most part from the 15th century. Since 1837 Schwerin has been once more the residence of the grand-duke, and the seat of government and of various high tribunals,—a fact which has had considerable influence on the character of the town and the tone of its society. Neither the manufacturing industry nor the trade of Schwerin is important. In 1885 the population was 32,031—including about 700 Roman Catholics and 400 Jews—an increase of 64 per cent since 1880.

Schwerin is mentioned as a Wendish stronghold in 1018, its name (*Szwain* or *Swain*) being a Slavonic word equivalent to "game-preserver." The Obotrite prince Nielt, whose statue is placed above the portal of the palace as the ancestor of the present reigning family, had his residence here. The town, founded in 1161 by Henry the Lion in opposition to this pagan fortress, received town-

rights in 1167. From 1170 to 1624 it gave name to a bishopric; and it was also the capital of the duchy of Schwain, which forms the western part of the grand-duchy of Mecklenburg-Schwernin. Destructive fires, the hardships of the Thirty Years' War, and the removal of the court to Ludwigslust in 1706 seriously depressed the town. It owes its revival and many of its chief buildings to the grand-duke Paul Frederick (1837-42), to whom a statue by Rauch was erected in 1859.

SCHWIND, MORITZ VON (1804-1871), a painter of the romantic school, was born in Vienna in 1804. He received rudimentary training and led a joyous careless life in that gay capital, among his companions was the musician Schubert, whose songs he illustrated. In 1828 he removed to Munich, and had the advantage of the friendship of the painter Schnorr and the guidance of Cornelius, then director of the academy. In 1834 he received the commission to decorate King Louis's new palace with wall paintings illustrative of the poet Tieck. He also found in the same palace congenial sport for his fancy in a "Kinderfries," his ready hand was likewise busy on almanacs, &c., and by his illustrations to Goethe and other writers he gained applause and much employment. In the revival of art in Germany Schwind held as his own the sphere of poetic fancy. To him was entrusted in 1839, in the new Carlsruhe academy, the embodiment in fresco of ideas thrown out by Goethe, he decorated a villa at Leipzig with the story of Cupid and Psyche, and further justified his title of poet-painter by designs from the *Niebelungenlied* and Tasso's *Gerusalemme* for the walls of the castle of Hohenschwangau in Bavarian Tyrol. From the year 1844 dates his residence in Frankfurt; to this period belong some of his best easel pictures, pre-eminently the Singers' Contest in the Wartburg (1846), also designs for the Goethe celebration, likewise numerous book illustrations. The conceptions for the most part are better than the execution. In 1847 Schwind returned to Munich on being appointed professor in the academy. Eight years later his fame was at its height on the completion in the castle of the Wartburg of wall pictures illustrative of the Singers' Contest and of the History of Elizabeth of Hungary. The compositions received universal praise, and at a grand musical festival to their honour Schwind himself played among the violins. In 1857 appeared his exceptionally mature "cycnus" of the Seven Ravens from Grimm's fairy stories. In the same year he visited England to report officially to King Louis on the Manchester art treasures. And so diversified were his gifts that he turned his hand to church windows and joined his old friend Schnorr in designs for the painted glass in Glasgow cathedral. Towards the close of his career, with broken health and powers on the wane, he revisited Vienna. To this time belong the "cycnus" from the legend of Melusine and the designs commemorative of chief musicians which decorate the foyer of the new opera-house. Cornelius writes, "You have here translated the joyousness of music into pictorial art." Schwind's genius was lyrical, he drew inspiration from chivalry, folk-lore, and the songs of the people, his art was decorative, but lacked scholastic training and technical skill. Schwind died at Munich in 1871, and his body lies in the old Friedhof of the same town.

SCHWYZ, one of the forest cantons of Switzerland, ranking fifth in the confederation. It extends from the upper end of the Lake of Zurich on the north to the middle reach of the Lake of Lucerne on the south; on the west it touches at Küssnacht the northern arm of the latter lake, and at Arth the Lake of Zug, while on the east it stretches to the ridges at the head of the Mottathal, which divide it from Glarus. Its total area is 3507 square miles, of which 254.9 are classed as "productive land" (193.3 of this being pasture or arable land) and 95.8 as "unproductive land" (glaciers and lakes occupying 21 square

and *katamena*. The island is rugged and well deserves the epithet "craggy" (*καταλόσσα*) applied to it in the Homeric hymn. The southern part is less rocky than the northern, and the wealth of the island is concentrated there. The figs of Chios were noted in ancient times, but wine and gum mastic have always been its most important products. The climate is almost perfect, the atmosphere delightful and healthy, oranges, olives, and even palms grow freely. The finest wine was grown on the north-western coast, in the district called by Strabo Arusia, and was known in Italy as *vinum Arusiense*. The population of Chios has always been far greater than its resources could feed, the people have therefore been forced to import the necessaries of life in exchange for their wine and mastic and fruit, and alike in ancient and modern times they have been known as merchants and traders. Pottery of Chios and Thasos was exported to Illyria (Strab. p. 317) and doubtless elsewhere; it formed or contained the cargo of outward-bound trading ships. Thasian ware is familiar in museums, where the stamped handles of Thasian amphorae have been collected in thousands, but no pottery has yet been identified as of Chian manufacture. An incidental proof of the importance of Chian handicrafts lies in the fact that early in the 7th century B.C. Glaucus of Chios discovered this process of soldering iron, and the iron stand of a large crater whose parts were all connected by this process was constructed by him, and preserved as one of the most interesting relics of antiquity at Delphi. The long line of Chian sculptors in marble, Bupalus and Athenis, sons of Archemorus, son of Miconades, son of Melas, bears witness to the fame of Chian art in the period 660 to 540 B.C. The Winged Victory of Miconades and Archemorus, which was dedicated at Delos, is still preserved,—the most important attested work extant of archaic Greek art. Marble quarries also were worked in the island. In literature the chief glory of Chios was the school of epic poets called Homeridae, who carried on and gave an Ionic tone to the traditional art of the older *Eolic* bards. Cynaethus is said to have written the Homeric *Hymn to Apollo of Delos*, and is believed by some modern critics to have exercised great influence on the text of the *Iliad* and *Odyssey*. The Chian recension of these poems (*Χία Έκδοσις*) was in later times one of the standard texts. Ion the tragic poet, Theopompus the historian, and other writers maintained the position of Chios in literature during the classical period.

The chief city of Chios has always borne the same name as the island. It is situated near the middle of the eastern coast, and at the present day contains about 7,000 inhabitants. A theatre and a temple of Athena Poluchus existed in the ancient city. About 6 miles north of the city there is a curious monument of antiquity, commonly called "the school of Homer"; it is a very ancient sanctuary of Cybele, with an altar and a figure of the goddess with her two lions, cut out of the native rock on the summit of a hill. On the west coast there is a monastery of great wealth with a church founded by Constantine IX (1042-54). Starting from the city and encompassing the island, one passes in succession the promontory Pseudium, Cape Phanae, the southern extremity of Chios, with a harbour and a temple of Apollo, Notium, probably the south-western point of the island, Lai, opposite the city of Chios, where the island is narrowest, the town Bolissus (now Volissos), the home of the Homeric poets, Melenia, the north-western point, the wine-growing district Arusia, Cardanyle (now Cardhamili), the north-eastern promontory was probably named Plimum, and the mountains that cross the north part of the island Peliclus or Pelliceneus. The situation of the small towns Letocumum, Delphinium, Caucasia, Coia, and Polichne is uncertain, probably most of them were in the southern part. The island is subject to earthquakes, a very destructive shock occurred in March 1861.

The history of Chios is very obscure. According to Pherecydes, the original inhabitants were Leleges, while according to other accounts Thessalian Pelasgi possessed the island before it became an Ionian state. The name *Alchala*, common to Chios and Lemnos in very early time, suggests the original existence of a homogeneous population in these and other neighbouring islands. Cnecpium, a mythical hero, son of Dionysus or of Rhadamantus, was an early king of Chios. His successor in the fourth generation, Hector,

united the island to the Ionian confederacy (Pausan. vii 4), though Strabo (p. 632) implies an actual conquest by Ionian settlers. The name Hector and the fountain Helene (probably at the modern Thelena in the north) might be expected in the island of the Homeridae. The local government was at a later time exchanged for an oligarchy or a democracy, but nothing is known as to the manner and date of the change. As in most other states of Greece, tyrants sometimes ruled in Chios, the names of Amphiclus and Polyctenus are mentioned. The early relations of Chios with other states are very obscure, but it seems to have been an ally of Miletus, and to have been at enmity with the Phocæo-Samian alliance, to which the neighbouring Erythræ belonged. The same form of the Ionian dialect was spoken in Chios and in Erythræ.

When the Persians appeared on the Ionian coast Chios willingly submitted, refused to fight old enemies the Phocæans, who were fleeing from the Persian yoke, a refuge on their islands Gnossus, and even succeeded the Lydian fugitive Pactyes in defiance of all religious scruples. Strattus, tyrant of Chios, followed Darius in his Scythian expedition. The Chians joined in the Ionian rebellion against the Persians (500-495) and supplied 100 ships. After the Persian victory at Lade the island was most severely treated, the towns and temples burned, and many of the people enslaved. At Salamis (480) the Chian ships, led by the tyrant Strattus, served in the Persian fleet. After the battle of Mycale (479) the island became free and a democratic government no doubt took the place of the tyranny. Chios was the most powerful state after Athens in the Delian confederacy, and it was an ally on equal terms of the Athenian empire, paying no tribute, but furnishing ships in case of war. It remained a faithful ally of the Athenians till the year 412, when, encouraged by the weakness caused in Athens by the Sicilian disasters, it joined the Lacedæmonians. Its fleet then consisted of fifty ships. The Athenians defeated them in three battles, at Bolissus, Phanae, and Letocumum, but could not reconquer the island. Finding the Spartan hegemony more oppressive than the Athenian, Chios returned to the Athenian connexion in 394, but soon afterwards deserted and joined the Thebans. In the wars of Alexander the Great Memnon, supported by the oligarchical party, held the island for the Persians. It was afterwards involved in the rapid vicissitudes of Ionian history, falling under the power of various dynasties among the *diadochi*. In the Mithradatic war it favoured the Roman alliance, and the king's general Zenobius fined the island 2000 talents and carried off a great number of the population into slavery in Pontus. It had many centuries of peaceful rule by the Roman emperors. Byzantine rule. The Genoese held it from the 14th century till in 1566 the Turks conquered it and the third great Chian disaster and massacre occurred. Except for a brief Venetian occupation in 1694, Chios has remained in Turkish hands till the present day. A fourth massacre afflicted the island in 1822, when the Turks repressed with fire and sword the attempted Greek insurrection. Till this terrible event the island was ruled very leniently by the Turks, the internal government was left in the hands of five aichons, three Greek and two Catholic, while two insolent Turkish officials represented the sultan and received through the aichons the stipulated tribute.

(W M RA.)

SCIPIO. The Scipios,¹ a memorable name in Roman history, were a branch of the ancient and noble family of the Corneli. It was in Rome's wars with Carthage that they made themselves specially famous.

1 PUBLIUS CORNELIUS SCIPIO, the father of the Elder Africanus, was the first Roman general to encounter Hannibal in battle. He was consul in 218 B.C., the first year of the Second Punic War, and, leaving Spain for his province, he went with an army to Massilia (Marseilles) with the view of arresting the Carthaginian's advance on Italy. Failing, however, to meet his enemy, he hastened back by sea to Cisalpine Gaul, leaving his army under the command of his brother Cneius Scipio, who was to harass the Carthaginians in Spain and hinder them from supporting Hannibal. In a sharp cavalry engagement in the upper valley of the Po, on the Trebia, he was defeated and severely wounded, and it is said he owed his life to the bravery of his son, then a mere stripling. Again, in the December of the same year, he witnessed the complete defeat of the Roman army on the Trebia, his colleague Sempronius having insisted on fighting contrary to his advice. But he still retained the confidence of the Roman people, since his term of command was extended, and we find him with his brother in Spain in the following year,

¹ The name means a "stick" or "staff."

winning victories over the Carthaginians and strengthening Rome's hold on that country, till 212 or 211. The details of these campaigns are not accurately known to us, but it would seem that the ultimate defeat and death of the Scipios were due to the desertion of the Celtiberi, bribed by Hasdrubal, Hannibal's brother.

2 PUBLIUS CORNELIUS SCIPIO AFRICANUS THE ELDER — After having been present at the disastrous battles of the Trebia, the Trebia, and Cannæ, and having after that last crushing defeat had the spirit to remonstrate with several Roman nobles who advocated giving up the struggle and quitting Italy in despair, Scipio, at the age of twenty-four, offered to take the command of the Roman army in Spain the year after his father's death. The people already had an intense belief in him, and he was unanimously elected. All Spain west of the Ebro was in the year of his arrival (210) under Carthaginian control, but fortunately for him the three Carthaginian generals, Hasdrubal (Hannibal's brother), Hasdrubal the son of Gisco, and Mago (also Hannibal's brother), were not disposed to act in concert. Scipio was thus enabled to surprise and capture New Carthage, the headquarters of the Carthaginian power in Spain, from which he obtained a rich booty of war stores and supplies, with a particularly good harbour. The native Spanish tribes now became friendly, and Scipio found useful allies among them. In the following year he fought Hasdrubal somewhere in the upper valley of the Guadalquivir, but the action could hardly have been a decisive one, as soon afterwards the Carthaginian crossed the Pyrenees at the head of a considerable army on his way to Italy. Next year another battle was fought in the same neighbourhood, and Scipio's success appears to have been sufficiently decided to compel the Carthaginian commanders to fall back on Gades, in the south-western corner of Spain. The country was now for the most part under Roman influence, a result due even more to the statesmanlike tact of Scipio than to his military ability. With the idea of striking a blow at Carthage in Africa, the Roman general paid a short visit to the Numidian princes, Syphax and Masinissa, but at the court of Syphax he was foiled by the presence of Hasdrubal, the son of Gisco, whose daughter Sophonoba was married to the Numidian chief. On his return to Spain Scipio had to quell a mutiny which had broken out among his troops. Hannibal's brother Mago had meanwhile sailed for Italy, and Scipio himself in 206, after having established the Roman ascendancy in Spain, gave up his command and returned to Rome to stand for the consulship, to which he was unanimously elected the following year, the province of Sicily being assigned to him. By this time Hasdrubal with his army had perished on the Metaurus, and Hannibal's movements were restricted to the south-western extremity of Italy. For Rome the worst part of the struggle was over. The war was now to be transferred by Scipio from Italy to Africa. He was himself eagerly intent on this, and his great name drew to him a number of volunteers from all parts of Italy. There was but one obstacle the old-fashioned aristocracy of Rome did not like him, as his taste for splendid living and Greek culture was particularly offensive to them. A party in the senate would have recalled him, but the popular enthusiasm was too strong for them. A commission of inquiry was sent over to Sicily, and it found that he was at the head of a well-equipped fleet and army. At the commissioners' bidding he sailed in 204 from Lilybæum (Marsala) and landed on the coast of Africa near Utica. Carthage meanwhile had secured the friendship of the powerful Numidian chief Syphax, whose advance compelled Scipio to raise the siege of Utica and to entrench himself on the shore between that place and Carthage. Next year he surprised and utterly defeated Syphax and

drove the Carthaginian army out of the field. There was an attempt at negotiation but the war party prevailed and Hannibal was recalled from Italy. The decisive battle was fought near the Numidian town of Zama in 202 and ended in Hannibal's complete defeat. Peace was concluded with the Carthaginians in the following year on terms which strictly confined their dominion to a comparatively small territory in Africa, almost annihilated their fleet, and exacted a heavy war contribution. In fact, the independence of Carthage was destroyed, and it became simply a rich commercial city. The old-fashioned and narrow-minded aristocrats who were in sympathy with the "delenda est Carthago" policy subsequently announced by Cato thought these terms too lenient, but Scipio was too great and too generous a man to lend himself to the base work of utterly extinguishing an ancient and noble centre of civilization. Rome was now perfectly safe from attack. It was a great Mediterranean power: Spain and Sicily were Roman provinces, and the north of Africa was under a Roman protectorate. Such was the end, after seventeen years, of the Second Punic War. Scipio was welcomed back to Rome with the surname of Africanus, and he had the moderation and good sense to refuse the many honours which the people would have thrust upon him. For some years he lived quietly and took no part in politics. In 190 his brother Lucius Scipio was consul and, on the understanding that he should have the benefit of the military skill and experience of Africanus, he was entrusted with the war in Asia against Antiochus. The two brothers brought the war to a conclusion by a decisive victory at Magnesia in the same year. Meanwhile Scipio's political enemies had gained ground, and on their return to Rome a prosecution was started against Lucius on the ground of misappropriation of moneys received from Antiochus. As Lucius was in the act of producing his account-books his brother wrested them from his hands, tore them in pieces, and flung them on the floor of the senate-house. He was then himself accused of having been bribed by Antiochus, but he reminded his accusers that the day was ill chosen, as it happened to be the anniversary of his great victory over Hannibal at Zama. There was an outburst of enthusiasm, and Scipio was once again the hero and the darling of the Roman people, who, it is said, crowded round him and followed him to the Capitol. After all, however, he ended his days, as a voluntary exile in all probability, at Linternum on the coast of Campania, dying, it would seem, in 183, the year of Hannibal's death, when a little above fifty years of age. Scipio's wife was Æmilia, daughter of the Æmilius Paullus who fell at Cannæ and who was the father of the conqueror of Macedonia. By her he had a daughter, Cornelia, who became the mother of the two famous Gracchi.

Spain, Northern Africa, the so-called province of Asia, were added to Rome's dominion during his life. Scipio lived to see Rome develop from a merely Italian power to be in fact the mistress of the world, and he himself greatly contributed to this result. Among Rome's great generals we must rank him after Cæsar. He knew how to plan a campaign as well as how to fight a battle, and he had the faculty of inspiring his soldiers with confidence and enthusiasm. He never had to make head against such tremendous difficulties as his great antagonist, and his achievements, great as they were, must be distinctly ranked beneath the marvellous successes of Hannibal. Still the story was told that, in a conversation between the two generals at the court of Antiochus, Hannibal, who had named Alexander as the first and Pyrrhus as the second among military commanders, confessed that he had beaten Scipio he should have put himself before either of them. It seems to be at any rate certain that the two great men respected and admired each other, and it is much to Scipio's credit that he withstood the mean persecution with which the Roman senate followed up the Carthaginian. It may be that he had rather too much aristocratic *hauteur* for a statesman in time of peace, but against this we must set the pleasing fact that he was a man of great intellectual culture and could speak and write Greek just as well as his native Latin. He wrote his

own enemies in Greek. There must indeed have been a wonderful charm about the man, and there was a belief that he was a special favourite of heaven and held actual communication with the gods. It is quite possible too that he himself honestly shared this belief, and so it was that to his political opponents he could be harsh and arrogant and towards others singularly gracious and sympathetic. For a time he enjoyed a popularity at Rome which no one but Cæsar ever attained.

3. **PUBLIUS CORNELIUS SCIPIO AFRICANUS THE YOUNGER.**—This Scipio, also one of Rome's greatest generals, was the younger son of Æmilius Paulus, and he fought when a youth of seventeen by his father's side at Pydna, 168,—the battle which decided the fate of Macedonia and made northern Greece subject to Rome. He was adopted by the eldest son of Scipio Africanus the Elder, and from him took the name Scipio with the surname Africanus. In 151, a time of defeat and disaster for the Romans in Spain, which as yet had been but very imperfectly subjugated, he served with credit in that country and obtained an influence over the native tribes similar to that which the elder Scipio, his grandfather by adoption, had acquired nearly sixty years before him. In the next year an appeal was made to him by the Carthaginians to act as arbiter between them and the Numidian prince Masinissa, who, backed up by a party at Rome, was incessantly encroaching on Carthaginian territory. Rome's policy in Africa was to hold the balance between Masinissa and Carthage, and, when it was seen that Carthage, as the result of several years of peace, was again becoming a prosperous and powerful city, there grew up a feeling at Rome that the Numidian king must be supported and their old rival thoroughly humiliated. Marcus Cato and his party would hear of no compromise; Carthage, they said, must be destroyed if Rome was to be safe. It was easy to find a pretext for war in the disputes between Carthage and Masinissa. In 149 war was declared, and the Carthaginians felt it to be a life-and-death struggle—every man and every woman laboured to the uttermost for the defence of the city with a furious enthusiasm. The Roman army, in which Scipio at first served in a subordinate capacity, was utterly baffled. In the following year he was elected consul, while yet under the legal age, for the express purpose of giving him the supreme command. After two years of desperate fighting and splendid heroism on the part of the defenders, the famished garrison could no longer hold the walls: Carthage was captured, and the ruins of the city were burning for seventeen days; Rome decreed that the place should be for ever desolate. On his return to Rome Scipio became the subject of violent political attacks, against which he successfully defended himself in speeches (no longer extant) that ranked as brilliant specimens of oratory. In 134 he was again consul, with the province of Spain, where a demoralized Roman army was vainly attempting the conquest of Numantia on the Douro. Scipio, after devoting several months to the discipline of his troops, reduced the city by blockade. The fall of Numantia, which was utterly destroyed in 133, established the Roman dominion in the province of Hither or Nearer Spain, the eastern portion of that country. Rome meanwhile was shaken by the great political agitation of the Gracchi, whose sister Sempronia was Scipio's wife. Scipio himself, though not in sympathy with the extreme men of the old conservative party, was decidedly opposed to the schemes of the Gracchi. "Justly slain" (*jure cæsum*) is said to have been his answer to the tribune Carbo, who asked him before the people what he thought of the death of Tiberius Gracchus. This gave dire offence to the popular party, which was now led by his bitterest foes. Soon afterwards, in 129, he was found dead in bed on the morning of a day on which he had intended to make a speech on a point connected with the

agrarian proposals of the Gracchi,—“a victim of political assassination” Mommsen confidently pronounces him. The mystery was never cleared up, and there were political reasons for letting the matter drop.

The Younger Scipio, great general and great man as he was, is for ever associated with a hideous work of destruction at Carthage, which we feel he might have done more to avert. Yet he was a man of culture and refinement, he gathered round him such men as the Greek historian Polybius, the philosopher Panætius, and the poets Lucilius and Terence. And at the same time, according to Polybius, and Cicero, he had all the good sterling virtues of an old-fashioned Roman, and steadily set his face against the increasing luxury and extravagance of his day. As a speaker he seems to have been no less distinguished than as a soldier. He spoke remarkably good and pure Latin, and he particularly enjoyed serious and intellectual conversation. There seems to have been nothing mean or grasping about him. After the capture of Carthage he gave back to the Greek cities of Sicily the works of art of which Carthage had robbed them. He did not avail himself of the many opportunities he must have had of amassing a fortune. Though politically opposed to the Gracchi, he cannot be said to have been a foe to the interests of the people. He was, in fact, a moderate man, in favour of conciliation, and he was felt by the best men to be a safe political adviser, while, as often happens in such cases, he could not help offending both parties.

4. Scipios are continually appearing in Roman history in more or less prominent positions down to the time of the empire. One of them, **SCIPIO NASICA** (Nasica denoting an aquiline nose), contemporary of the Younger Africanus, instigated the murder of Tiberius Gracchus, whom the people were bent on re-electing (133) to the tribuneship. Though he was pontifex maximus at the time, the senate, to save him, had to get him away from Rome, and he left never to return, dying soon afterwards in Asia. (W J B)

SCIRE FACIAS, in English law, is a judicial writ founded upon some record directing the sheriff to make it known (*scire facias*) to the party against whom it is brought, and requiring the latter to show cause why the party bringing the writ should not have the advantage of such record, or why (in the case of letters patent and grants) the record should not be annulled and vacated. Proceedings in *scire facias* are regarded as an action, and the defendant may plead his defence as in an action. The writ is now of little practical importance, its principal uses are to compel the appearance of corporations aggregate in revenue suits, and to enforce judgments against shareholders in such companies as are regulated by the Companies Clauses Act, 1845, or similar private Acts, and against garnishees in proceedings in foreign attachment in the lord mayor's court. Proceedings by *scire facias* to repeal letters patent for inventions were abolished by the Patents, Designs, and Trademarks Act, 1883, and a petition to the court substituted.

SCOPAS. See ARCHEOLOGY, vol. 11 p. 360.

SCORESBY, WILLIAM (1789–1857), English arctic explorer and physicist, was born near Whitby, Yorkshire, on 5th October 1789. His father, also named William, who achieved distinction as an arctic whaler, was the son of a farmer near Crompton, Lancashire, where he was born on 3d May 1760. He went to sea when he was twenty years of age, and became one of the most prominent and successful, as well as daring, of arctic whale-fishers. In 1823 he retired with an ample competency, and died in 1829. Young Scoresby made his first voyage with his father to Greenland in 1800, when he was only eleven years of age. On his return, up to 1803, he diligently pursued his education, acquiring a very fair knowledge of mathematics and navigation. From 1803 he was his father's constant companion to the whale-fishery. On 25th May 1806, as chief officer of the “Resolution,” he succeeded in reaching 81° 30' N in 19° E long., the farthest point north attained by any navigator up to that date. On his return, during the following winter, Scoresby attended the natural philosophy and chemistry classes in Edinburgh

university, as he did again in 1809, when he added several other subjects. In his voyage of 1807 he commenced, as in all subsequent voyages he continued, the study of the meteorology and natural history of the polar regions, among the earlier results are his original observations on snow crystals. In 1809 Professor Jameson of Edinburgh brought Scoresby's arctic papers before the Wernerian Society of that city, of which he was at once elected a member. Soon after attaining his majority, in 1811, Scoresby was promoted to the command of the "Resolution," and in the same year married the daughter of a shipbroker. In 1813 he changed the "Resolution" for the "Esk," in both vessels bringing home large and profitable captures. In his voyage of 1813 Scoresby ascertained that the temperature of the polar ocean is warmer at considerable depths than it is on the surface. Each subsequent spring found Scoresby in search of whales, and no less eagerly of fresh additions to scientific knowledge. His letters of this period to Sir Joseph Banks no doubt gave the first impulse to the modern search for the north-west passage. In 1819 he was elected a fellow of the Royal Society of Edinburgh, and among other papers of the year was one communicated to the Royal Society of London through Sir Joseph Banks, "On the Anomaly in the Variation of the Magnetic Needle," touching upon a subject of the first scientific importance. In 1820 appeared Scoresby's *History and Description of the Arctic Regions*, in which he gathers up the results of his own observation, as well as those of previous navigators, and which still remains a standard authority. In his voyage of 1822 to Greenland, among other scientific work, Scoresby surveyed 400 miles of the east coast, between 69° 30' and 72° 30' N., with so much accuracy that the Government expeditions of the next year were unable to make any substantial correction, although they attempted to ignore his work. This was the last of Scoresby's arctic voyages. On his return he found his wife dead, and this event, acting upon his naturally pious spirit along with other influences, decided him to enter the church. After two years of residence in Cambridge, he in 1825 was ordained and on 17th July was appointed curate of Bassingby. Meantime had appeared at Edinburgh, in 1823, his *Journal of a Voyage to the Northern Whale-Fishery, including Researches and Discoveries on the Eastern Coast of Greenland*. The faithful and successful discharge of his clerical duties at Bassingby, in the mariners' chapel at Liverpool, at Exeter, and at Bradford did not prevent Scoresby from taking as much interest in science as he did during his whaling voyages. In 1824 the Royal Society elected him a fellow, and the Paris Academy of Sciences an honorary corresponding member. From the first he was an active member and official of the British Association, to which he made several important contributions, one being "An Exposition of some of the Laws and Phenomena of Magnetic Induction." To the progress of terrestrial magnetism especially Scoresby is recognized as having largely contributed. Of the sixty papers which follow his name in the Royal Society list many are more or less connected with this department of research. But his observations extended into many other departments, including certain branches of optics. In order to obtain additional data for his theories on magnetism he made a voyage to Australia in 1856, the results of which were published in a posthumous work,—*Journal of a Voyage to Australia for Magnetical Research*, edited by Archibald Smith (1859). He made two visits to America, in 1844 and 1848; on his return home from the latter visit he made some valuable observations on the height of Atlantic waves, the results of which were given to the British Association. Scoresby interested himself much in social questions, especially the

improvement of the condition of factory operatives. He also published numerous works and papers of a religious character, a list of which, as well as of his many scientific papers, is appended to the *Life of William Scoresby* by his nephew, Dr R. E. Scoresby-Jackson (1861). In 1850 he published a work on the Franklin expedition, urging the prosecution of the search for the missing ships, and giving the valuable results of his own experience in arctic navigation. Scoresby was twice married after the death of his first wife,—to Miss Elizabeth Fitzgerald in 1828, and in 1849 to Miss Georgina Kerr. After his third marriage Scoresby built a villa at Torquay, where he spent the remainder of his life, and where he died, 21st March 1857. He was a man of simple but deep piety, amiable, cheerful, and guileless.

SCORPION See ARACHNIDA, vol. ii. p. 281 sq.
SCOT, MICHAEL, whose fame as a magician has surrounded his history with legend, is sometimes claimed by the Italians as a native of Salerno and by the Spaniards as a native of Toledo, but there is no reason to doubt the Scottish origin to which his name testifies. Scottish tradition is unanimous in identifying him with Sir Michael Scot of Balwearie in Fifeshire, but the ascertainable dates place some difficulties in the way of this. The traditional date of Scot's birth is 1190, but this does not harmonize well with the embassy to Norway attributed to Sir Michael Scot in 1290. Some accordingly have fixed the date of his birth approximately as 1214, but apparently without any further reason than is afforded by the supposed date of his death in 1291. But Jourdain¹ refers to certain manuscript translations of Scot's which are expressly dated "1217 at Toledo." This would accord fairly well with the date 1190, the translations being executed by Scot soon after the conclusion of his student period. Scot is said to have studied at Oxford, whence he proceeded, as was usual, to Paris, then the centre of mediæval learning, devoting himself especially to philosophy and mathematics. Du Boulay, the historian of the university of Paris, adds that he received the degree of doctor of theology and acquired a brilliant reputation in that faculty. There is no evidence of this, however, in his writings. At Toledo, where he also studied, Scot acquired a knowledge of Arabic. It is not likely that his knowledge extended to Greek and the other Eastern tongues mentioned by the earlier bibliographers. His knowledge of Arabic was sufficient to open up to him the Arabic versions of Aristotle and the multitudinous commentaries of the Arabians upon them, with which Western Christendom had only lately become acquainted in Latin translations (see SCHOLASTICISM). It also brought him into contact with the original works of Avicenna and Averroes. His own first work was done as a translator. He was one of the savants whom Frederick II. attracted to his brilliant court, and at the instigation of the emperor he superintended (along with Hermannus Alemannus) a fresh translation of Aristotle and the Arabian commentaries from Arabic into Latin. There exist translations by Scot himself of the *Historia Animalium*, the *De Anima*, and *De Cælo*, along with the commentaries of Averroes upon them. This connexion with Frederick and Averroes—both of evil reputation in the Middle Ages—doubtless contributed to the formation of the legend which soon enveloped Michael Scot's name. His own books, however, dealing as they do almost exclusively with astrology, alchemy, and the occult sciences generally, are mainly responsible for his popular reputation. The chief of these according to the more critical views of recent investigators are *Super Astorem Sphæram*, printed at Bologna in 1495 and at Venice in 1631; *De Sole et Luna*, printed at Strasburg, 1622,

¹ *Recherches sur les anciennes traductions Latines d'Aristote*, p. 138

in the *Theatrum Chemicum*, and containing more alchemy than astronomy, the sun and moon being taken as the images of gold and silver, *De Chymomatia*, an opuscle often published in the 15th century, and, perhaps best known of all, *De Physiognomia et de Hominis Procreatione*, which saw no fewer than eighteen editions between 1477 and 1660. This treatise is divided into three books, of which the first deals with generation according to the doctrine of Aristotle and Galen, the second with the signs by which the character and faculties of individuals may be determined from observation of different parts of the body. The *Physiognomia* (which also exists in an Italian translation) and the *Super Auctorem Sphære* expressly bear that they were undertaken at the request of the emperor Frederick. To the above list should be added certain treatises in manuscript, — *De Signis Planetarum*, *Contra Astroheros in Meteora*, *Notitia Connectionis Mundi Terrestriis cum Cælesti*, and *de Definitione astrisque Mundi*, *De Præcipuis Stellarum et Elementaribus*. Michael is said to have foretold (after the double-tongued manner of the ancient oracles) the place of Frederick's death, which took place in 1250. The Italian tradition makes Scot die in Sicily not long afterwards, stating that he foretold the manner of his own death. Jourdain is inclined to agree with this approximate date, observing that Scot is spoken of by Albert the Great as if he were already dead, and that Vincent of Beauvais (d. c. 1268) quotes him with the epithet "reus." But the generally received tradition makes him return by way of England (where he was received with much honour by Edward I.) to his native country. The ordinary account gives 1291 as the date of Scot's death. According to one tradition he was buried at Holme Cultram in Cumberland, according to another, which Sir Walter Scott has followed in the *Lay of the Last Minstrel*, in Melrose Abbey. In the notes to that poem, of which the opening of the wizard's tomb forms the most striking episode, Scott gives an interesting account of the various exploits attributed by popular belief to the great magician. "In the south of Scotland any work of great labour and antiquity is ascribed either to the agency of Auld Michael, of Sir William Wallace, or the devil." He used to feast his friends with dishes brought by spirits from the royal kitchens of France and Spain and other lands. His embassy to France alone on the back of a coal-black demon steed is also celebrated, in which he brought the French monarch to his feet by the effects which followed the repeated stamping of his horse's hoof. Other powers and exploits are narrated in Folengo's Macaronic poem of *Martin Coccaus* (1595). But Michael's reputation as a magician was already fixed in the age immediately following his own. He appears in the *Inferno* of Dante (canto xx. 115-117) among the magicians and soothsayers—

"Quell'altro, che ne' fianchi è così poco,
Michele Scotto fit, che veramente
De'le magiche fiocce sopra il guccio."

He is represented in the same character by Boccaccio, and is severely arraigned by John Pico de Mirandola in his work against astrology, while Naudé finds it necessary to defend his good name in his *Apologie pour les grands personnages faussement accusés de magie*.

SCOT, REGINALD (c. 1538-1599), was the son of Richard, third son of Sir John Scot of Scotshall, Smeeth (Kent), studied at Hart Hall in Oxford, and afterwards lived in studious retirement at Smeeth, dying in 1599. He was the author of a very remarkable book, *The Discoverie of Witchcraft*, the object of which was to put an end to the cruel persecution of witches, by showing that "there will be found among our *Witches* only two sorts, the one sort being such by imputation, as so thought of by others (and

these are abused and not abusers), the other by acceptation, as being *willing* so to be accounted, and these be meer *Coseners*." This thesis is worked out in sixteen books, with great learning and acuteness, in a spirit of righteous indignation against the witchmongers. Scot was far in advance of his time, and his book, of which the first edition appeared in 1584, was burned by order of King James I. The book is still interesting, not only as having anticipated Bekker by a century, but for the great mass of curious details as to every branch of so-called witchcraft which it contains. It also takes up natural magic and conjuring at considerable length (bk. xiii.), and contains an argument against "alchemy" (bk. xiv.).

Scot also published in 1574 *A perfitte Platforme of a Hoppe Garden* (3d ed. 1578), which is noteworthy as having originated the cultivation of the hop in England. A second edition of the *Discoverie* is appeared in 1661 and a third in 1665, the latter contained nine new chapters, prefixed by an anonymous hand, to bk. xx. of the *Discoverie*, and the addition of a second book to the "Discourse concerning Angels and Spirits" (bk. xiv.).

See B. Nicholson's *Scot's Discoverie of Witchcraft*, London, 1856.

SCOTER, a word of doubtful origin, perhaps a variant of "Scout," one of the many local names shared in common by the GUILLEMOT (vol. xi. p. 262) and the RAZORBILL (vol. xx. p. 302), or perhaps primarily connected with COOT (vol. vi. p. 341),¹ the English name of the *Anas nigra* of Linnæus, which with some allied species has been justifiably placed in a distinct genus, *Edemia* (often misspelt *Oedemia*)—a name coined in reference to the swollen appearance of the base of the bill. The Scoter is also very generally known around the British coasts as the "Black Duck" from the male being, with the exception of a stripe of orange that runs down the ridge of the bill, wholly of that colour. In the representative American form, *Æ americana*, the protuberance at the base of the bill, black in the European bird, is orange as well. Of all Ducks the Scoter has the most marine habits, keeping the sea in all weathers, and rarely resorting to land except for the purpose of breeding. Even in summer small flocks of Scoters may generally be seen in the tideway at the mouth of any of the larger British rivers or in mid-channel, while in autumn and winter these flocks are so increased as to number thousands of individuals, and the water often looks black with them. A second species, the Velvet-Duck, *Æ fusca*, of much larger size, distinguished by a white spot under each eye and a white bar on each wing, is far less abundant than the former, but examples of it are occasionally to be seen in company with the commoner one, and it too has its American counterpart, *Æ velutina*, while a third, only known as a straggler to Europe, the Surf-Duck, *Æ perspicillata*, with a white patch on the crown and another on the nape, and a curiously particoloured bill, is a not uncommon bird in North-American waters. All the species of *Edemia*, like most other Sea-Ducks, have their true home in arctic or subarctic countries, but the Scoter itself is said to breed occasionally in Scotland (*Zoologist*, s. s. p. 1867). The females display little of the deep sable hue that characterizes their partners, but are attired in soot-colour, varied, especially beneath, with brownish white. The flesh of all these birds has an exceedingly strong taste, and, after much controversy, was allowed by the authorities to rank as fish in the ecclesiastical dietary (cf. Grandorge, *Traité de l'origine des Macreuses*, Caen, 1680, and *Correspondence of John Ray*, Ray Soc. ed., p. 148).

¹ In the former case the derivation seems to be from the O Fr *Beccute*, and that from the Latin *auscultare* (comp. Skeat, *Etymol. Dictionary*, p. 533), but in the latter from the Dutch *Koet*, which is said to be of Celtic extraction—*coitar* (cp. *at.*, p. 184). The French *Macreuse*, possibly from the Latin *maior*, indicating a bird that may be eaten in Lent or on the fast days of the Roman Church, is of double signification, meaning in the south of France a Coot and in the north a Scoter. By the wild-fowlers of parts of North America Scoters are commonly called Coots.

SCOTLAND

PART I—HISTORY

Agri-
cola's
cam-
paigns.

1. *Roman Period*—The first certain lines of the history of Scotland were written by the Romans. Their account of its partial conquest and occupation for more than three hundred years gives the earliest facts to which fixed dates can be assigned. The invasion commenced by Julius Cæsar reached in Agricola's last campaign limits never afterwards exceeded. It was in the last year of Vespasian's life that Julius Agricola, the ablest general bred in his camp, came to command the army in Britain. Landing in midsummer 78, he at once commenced a campaign against Wales. In his second campaign he passed the Solway and, defeating the tribes of Galloway, introduced rudiments of Roman civilization in the district where Níman taught the rudiments of Christianity three centuries later. This was the first conquest within modern Scotland. Two main roads, of which traces can still be seen, mark his advance: the western, from Carlisle through Dumfries and Lanark, extends across the Clyde to Camelon on the Carron, and the eastern, from Bremeonium (High Riechester) in Northumberland, passes through Roxburgh and Lothian to the Forth at Crarnod. Next year Agricola subdued unknown tribes, reached the estuary of the Tay, and occupied camps at various points of central Scotland, in the future shires of Stirling and Perth. Traces of them are still visible at Bochartie near Callander, Dalginross near Comrie, Fendoch on the Almond, Inveralmond at the junction of the Almond with the Tay near Perth, Ardsarge on the north of the Ochils, and the great camp at Ardoch south of Cneth. The fourth year of his command was devoted to the construction of a line of forts between the Forth and the Clyde. This barrier, strengthened by a wall in the reign of Antoninus Pius, guarded the conquests already made against the Caledonians—the general Latin name of the northern tribes of the forests and mountains, the Highlanders of later times—and, in connexion with camps already occupied in the lowlands of Perthshire, formed the base for further operations. In the fifth year Agricola crossed the Clyde, and, without making any permanent conquest on the western mainland, viewed from Cantyre the coast of Ireland. Statements by one of its chiefs as to the character and factions of that country, whose ports were already known to Roman merchants, led to the opinion communicated to Tacitus by Agricola, that with a single legion and a few auxiliaries he could reduce it to subjection. The number of legions in the Roman army of Britain was fixed at five, besides auxiliaries and cavalry,—a total of perhaps 50,000 men. The resistance of northern Britain explains why the easier conquest was not undertaken. A year was required to explore the estuaries of the Forth and the Tay with the fleet. The absence of camps indicates that no attempt was made to conquer the peninsula of Fife, perhaps a separate kingdom, and Agricola prepared to advance against the Caledonians. Two years' fighting, although Tacitus chronicles only an assault on the advanced camp of the IXth legion (at Lintrose (?) near Coupar Angus), passed before the final engagement known in history as the battle of the Grampians (84). It was probably fought in the hilly country of the Stormont near Blairgowrie, the Celts descending from strongholds in the lowest spurs of the Grampians and attacking the Romans, whose camp lay near the junction of the Isla and the Tay. It decided that the Roman conquest was to stop at the Tay. Galgacus, the Caledonian leader, was, according to the Roman historian, defeated, but in the following winter Agricola retreated to the

camp between the Forth and the Clyde, while the fleet 78-120 was sent round Britain. Starting probably from the Forth and rounding the northern capes, it returned after establishing the fact, already suspected, and of so much consequence in future history, that Britain was an island,—planting during its progress the Roman standard on the Orkneys, which had for several centuries been known by report, and sighting Shetland, the Thule of earlier navigators. Agricola, with one legion—probably the IXth, which had suffered most—was now recalled by Domitian.

The absence of any notice of Britain for twenty years implies the cessation of further advances,—a change of policy due to the reverses in the Dacian War and the financial condition of the empire.

The indefatigable Hadrian came to Britain (120) with the VIth legion, named *Victrix*, which replaced the IXth. He began, and his favourite general Aulus Plautius Nepos completed, between the mouth of the Tyne near Newcastle and the Solway near Carlisle, the great wall of stone (see HADRIAN'S WALL OF), about 80 miles in length, 16 feet high, and 8 feet thick, protected on the north by a trench 34 feet wide and 9 deep, with two parallel earthen ramparts and a trench on the south,—proving the line required defence on both sides. Massive fragments of the wall, its stations, castles, and protecting camps, with the foundation of a bridge over the North Tyne, may be still seen. It was garrisoned by the VIth legion, and by the XIth and XXth, which remained throughout the whole Roman occupation. The conquests of Agricola in what is modern Scotland were for a time abandoned. Hadrian's wall was the symbol of the strength of Rome, and also of the valour of the northern Britons. There must have been a stubborn resistance to induce the conquerors of the world to set a limit to their province, though the roads through the wall showed they did not intend this limit to be permanent. The first step had been taken. The country between the Tyne and Solway and the Forth and Clyde, including the southern Lowlands of Scotland, was now within the scope of Roman history, if not yet of Roman civilization. The country north of the last two rivers remained barbarous and unknown under its Celtic chiefs. Hadrian had thus resumed the task of Agricola, in one of the rapid campaigns by which he consolidated the empire through visits to its most distant parts, but it is doubtful whether he passed beyond the wall, which continued to separate the Romans from the barbarians. In the reign of his successor, Antoninus Pius, Lollius Urbicus recovered the country from the wall of Hadrian to the forts of Agricola, and built an earthen rampart about half the length of the southern wall, 20 feet high and 24 thick, protected on the north by a trench 40 feet wide and 20 deep. It was known later as Grim's or Graham's dyke. Remains may yet be seen between Carriden near Borrowstounness on the Forth and West Kilpatrick on the Clyde, with forts either then or subsequently erected at intermediate stations, connected by a military road on the south of the wall.

About this period Ptolemy composed the first geography of the Ptolemy's world, illustrated by maps—probably constructed somewhat later geography.—of Ireland and Britain, still called *Albion*.¹ South of modern Scotland the plan and description of the distances are generally accurate, but north of the Solway (Isthmus Æstuarium) and the Wear (Vedra) the island is figured as lying west and east instead

¹ His information must have come from Roman officers, who, we know, studied this branch of the military art, as maps have been found painted on the porticoes of their villas.

161-364 of north and south. Learned ingenuity corrects this error and, by other modifications and the use of a few points deemed certain, applies the names of Ptolemy to places on the map of modern Scotland. But the certain points are almost confined to the Clyde (Glotta Æstuarium), the Forth (Bodina Æstuarium), the Tay (Tava Æstuarium), and perhaps the Wear (Vedra) and the Nith (Novus), the Caledonian Wood (Caledonia Silva), and the Orkneys (Orcades). Even if the other identifications were clear, it would not add much to our knowledge of ancient Scotland. The names of Ptolemy are names on his map and in books only. No tribe (except the Caledonii), no town, no river (except the Forth and Clyde and Tay), no island (except the Orkneys), was, so far as we know, called before or since by the names which there appear. No inscription or coin confirms them. No mountains in this land of mountains are to be found on the plan of the geographer. Eymon logical conjecture, after allowance for misrepresentation and errors of transmission, fails to reconcile the names of Ptolemy with the oldest names of Celtic origin still retained by the rivers and hills. Yet the attempt represents the highest knowledge embodied in writing to which the Romans attained of this distant and disputed part of the empire, for the Itineraries, except the forged one attributed to Eulach of Chaucer, stop at Hadrian's wall. His tenure remained until the revival of learning the only written geographical description of the country from which the learned could picture northern Britain. With all its imperfections and mistakes, it conveyed in rough outline the figure of a country to the west of the European continent, to the north of the Roman province of Britain, to the east of Ireland, surrounded by the German Ocean, the Northern Ocean, and the Irish Channel, with bold promontories and many rivers (several truly), peopled by various tribes, its towns chiefly on the rivers or the coast, and in its centre the vast forest to which the Caledonians gave or from which they received their name, itself the northern part of the largest British island, with groups of smaller isles lying off its northern and western shores. This region was unknown to Caesar and imperfectly known to Tacitus,—the only writer of the first century to whom we can resort. Yet the description of the Britons by the latter, the general name of Rome, based on the account of one of its greatest generals, attempts a discrimination between the Celtic tribes first and those afterwards conquered, which may perhaps be applied to the inhabitants of the north as contrasted with those of the south of Britain.

"Whether the inhabitants of Britain were indigenous or foreigners, being barbarian, they did not take the trouble to inquire. The different characters of the body appeared in different parts of the island, but no arguments. The red hair and big limbs of the natives of Caledonia point to a German origin. The coloured faces of the Silures, their hair generally plaited, and Spain being opposite gave credit to the opinion that the ancient Iberi had migrated and occupied these settlements. Those nearest the Gauls were like them, whether on account of the enduring force of descent or the position of the sky determining in lands adjoining the character of the race. On a general view it is credible that the Gauls occupied the neighbouring island. You may detect the same sacred rites and superstitions. There is not much difference in their language. There is the same daring in demanding, the same fear in declining danger. The Britons exhibit greater fierceness, as a long peace has not yet softened them. For we have heard that the Gauls also were distinguished in war, until sloth came with ease and labour was lost with freedom. This too has been the case with the Britons formerly conquered. The rest remain what the Gauls were. Their strength is in their foot, some tribes, however, fight also from chariots. The noble drives, his followers are in front. Formerly they obeyed kings. Now they are distracted by parties and factions amongst their chiefs, and the want of common counsel is most useful to us. An agreement between two or three states to resist a common danger is rare, so while they fight singly the whole are defenceless."

In the account of the battle of the Gannan Mount and the speech of Gaius there is little that is local or individual. What the Celtic chief said in an unknown tongue can scarcely have been literally interpreted to the Romans. The historian trained in oratory embodies in Latin eloquence the universal sentiments of freedom. It may be thought, however, that the soil and air of Scotland favour independence of action and thought, and that the words whether of the battle of Gaius, contain an unconscious prophecy of passages in its future annals and traits in the character of its people not yet obliterated. In the first century of the Christian era Scotland was the scene of events which belong to universal history.

Hadrian to Severus. The necessity of the walls of Hadrian and Antonine to protect the Roman province soon appeared. It is doubtful how long or during what intervals the country between them remained subject. Few coins of emperors later than Antonine have been found to the north of Hadrian's wall.

In the reign of Aurelius, the philosophic emperor, war was not encouraged, but Calpurnius Agricola had to be sent (161) as legate and proprietor to Britain to prevent incursions of the northern tribes. In that of Commodus a more formidable invasion passed the wall, but Ulpus Marcellus drove back the Britons and repaired it, gaining for Commodus the title of Britannicus. While Septimius Severus was removing rivals from his path, his legate, Virius Lupus, purchased peace (201) from the Meatae, a tribe of central Scotland now first named, who along with the Caledonians supersede the older designations of Tacitus and Ptolemy for the population in the vicinity and to the north of Antonine's wall, until in the latter half of the 4th century the Picts and Scots appear. Seven years later (208) Severus, with his sons Caracalla and Geta, came, Severus like Edward I in his last campaign, worn out in body¹³ but not in spirit, to Britain. After repairing the breaches in Hadrian's wall he not only reconquered the country between it and the wall of Antonine, which he restored, but, passing beyond the steps of Agricola, carried the Roman eagles to the most northern points they reached. The traces of Roman roads from Falkirk to Stirling, through Strathearn to Perth, thence through Forfar, Means, and Aberdeen to the Moray Firth, and of Roman camps at Wardykes (Keithock), Raedykes (Stonehaven), Norman Dykes (on the Dee), and Raedykes on the Ythan belong to this period and represent an attempt to subdue or overawe the whole island. The historian Dion does not conceal the failure of the enterprise, which he ascribes to the illness that terminated in the death of Severus at York (211). He adds a little to our knowledge of the Caledonians by describing the painting of their bodies with forms of animals, their scanty clothing and iron ornaments, their arms—a sword, small shield, and spear, without helmets or breastplates—their chariots, and their mode of warfare by rapid attack and as rapid retreat to the forest and the marsh. Being without towns, they lived on the produce of herds and the chase, not on fish, though they had plenty. Their mode of government he calls democratic, doubtless from the absence of any conspicious king rather than of chiefs.

From the death of Severus to the accession of Constantine Chlorus, a period of nearly a century, the history of this northern Britain is unknown. In the first (305) of the two years of his reign Constantius defeated the tribes between the walls called by Eumenius the Panegyrist "the Caledonians and other Picts"—a name now first heard, and by this association identified with the Caledonians. Next year Constantius died at York, and for more than fifty years a veil is again drawn over northern Britain. It was during this period that Constantine was converted to Christianity, which his father Constantius had favoured during the persecutions of Diocletian. So rapid was the progress of the church in the British province that only ten years after the martyrdom of St Alban Celtic bishops of York, London, and Caerleon—probably the place of that name on the Usk—were present at the council of Arles. In 360 the Scots are for the first time named, by Ammianus Marcellinus, who records their descent along with the Picts upon the Roman province in terms which imply that they had before passed the southern wall. Four years later the Picts, Saxons, Scots, and Attacotti are said by the same writer to have caused the Britons perpetual anxiety, but Theodosius, father of the emperor of the same name, repulsed them

¹³ Paganus, the great just, then administered justice at York. Whether the Roman law so introduced survived in any part of modern England is a problem not yet solved, it certainly did not beyond the wall. The Roman substratum of Scottish law was of later origin, derived chiefly from the canon law of the church.

and recovered the country between the walls, which became (368) a fifth province of Britain, called in honour of the reigning emperor Valentinian. It remained so for a very brief space the revolt of Maximus (391), which reduced the Roman troops to two legions, led to fresh raids of the Picts and Scots. A legion sent by Stilicho drove them back to the northern wall. But it was soon recalled, and the garrisons were permanently removed prior to 409.

Effects of Roman occupation

The Roman empire in Britain left widely different results in the southern and in the northern portions of the island. The former became an organized, and in the centre of population a civilized province, in which the Latin name was spoken, the educated arts cultivated, Roman law administered, and Christianity introduced. The latter, with the partial exception of the district south of Antonine's wall, remained in the possession of barbarous heathen races, whose customs had altered little since Roman writers described them as similar to, though ruder than, those of the Celts in Gaul before its conquest. The condition of the population between the walls was probably intermediate between that of the southern provincial Britons and that of the northern savages of the same original Celtic stock, more nearly resembling the latter, perhaps not unlike the condition of the people of Wales, which the Romans in like manner overran, but could not hold, or of Afghanistan as compared with British India. No Roman towns existed, and only one or two villas have been found north of York, and quite near to that place. The camp, the altar, the sepulchral monument, possibly a single temple (the mysterious Arthur's Oven or John's Hoof on the Carron, now destroyed, but described by Boece and Buchanan and figured by Camden), the stations along the wall, the roads with their milestones, a number of coins (chiefly prior to the 2d century), and a few traces of baths are the only vestiges of Roman occupation in this part of Britain. So completely had Britain passed beyond the serious attention of the emperors of the East that in the beginning of the 6th century Belisarius, Justinian's general, sarcastically offered it to the Goths in exchange for Sicily, while Procopius, the Byzantine historian, has nothing to tell of it except that a wall was built across it by the ancients, the direction of which he supposes to have been from north to south, separating the fruitful and populous east from the barren serpent-haunted western district, and the strange fact that its natives were exacting tribute to the kings of the Franks in return for the service of ferrying the souls of the dead from the mainland to the shores of Britain.

Britons or Britons

2 *Early Celtic Period to Union of Picts and Scots by Kenneth Macalpine*—It is to the Celts, the first known inhabitants of Britain, that our inquiry next turns. This people were not indigenous, but came by sea to Britain. A conjecture, not yet proved, identifies as inhabitants of Britain before the Celts a branch of the race now represented in Europe only by the Basques. Amongst many names of British tribes in Latin writers three occur, two with increasing frequency, as the empire drew near its close—Britons, Picts, and Scots—denoting distinct branches of the Celts. Britain was the Latin name for the larger island and Britons for its inhabitants, Albion, a more ancient title, has left traces in English poetry, and in the old name Alba or Albany for northern Scotland. The Britons in Roman times occupied, if not the whole island, at least as far north as the Forth and Clyde. Their language, British, called later Cymric, survives in modern Welsh and the Breton of Brittany. Cornish, which became extinct in the 17th century, was a dialect of the same speech. Its extent northwards is marked by the Cumbræes—the Islands of Cymry in the Clyde—and Cumberland, a district originally stretching from the Clyde to the Mersey.

Picts or Cruithne

The Picts, a Latin name for the northern tribes who preserved longest the custom of painting their bodies, called themselves Cruithne. Their original settlements appear to have been in the Orkneys, the north of Scotland, and the north-east of Ireland—the modern counties of Antrim and Down. They spread in Scotland, before or shortly after the Romans left, as far south as the Pentland Hills, which, like the Pentland Firth, are thought to preserve their name, occupied Fife, and perhaps left a detachment in Galloway. Often crossing, probably some-

times using, the deserted wall of Hadrian, they came in 368-69 to acquire their name,—a name of awe to the provincial Britons, and their English conquerors. Their language, though Celtic, is still a problem difficult to solve, as so few words have been preserved. Its almost complete absorption in that of the Gaels or Scots suggests that it did not differ widely from theirs, and with this agrees the fact that Columba and his followers had little difficulty in preaching to them, though they sometimes required an interpreter. Some philologists believe it to have been more allied to Cymric, and even to the Cornish variety, but the proof is inconclusive.

The Scots came originally to Ireland, one of whose Scots, or names from the 6th to the 13th century was Scotia, ^{Gaels} Scotia Major it was called after part of northern Britain in the 11th century had acquired the same name. Irish traditions represent the Scots as Milesians from Spain. Their Celtic name Gaidhli, Goidel, or Gael appears more akin to that of the natives of Gaul. They had joined the Picts in their attack on the Roman province in the 4th century, and perhaps had already settlements in the west of Scotland, but the transfer of the name was due to the rise and progress of the tribe called Dalriad, which migrated from Dalriada in the north of Antrim to Argyll and the Isles in the beginning of the 6th century. Their language, Gaidhele, was the ancient form of the Irish of Ireland and the Gaelic of the Scottish Highlanders. No clear conclusion has been reached as to the meaning of Briton, Cruithne, Scot, and Gael.

The order of the arrival of the three divisions of the Order of Celtic race and the extent of the islands they occupied are ^{arrival of Celtic} uncertain. Bede in the beginning of the 8th century gives ^{1500 B.C.} the most probable account.

"This island at the present time contains five nations, the Angles, Britons, Scots, Picts, and Latins, each in its own dialect cultivating one and the same sublime study of divine truth. The Latin tongue by the study of the Scriptures has become common to all the rest. At first this island had no other inhabitants but the Britons, from whom it derived its name, and who, carried over into Britain, as is reported from Armenia, possessed themselves of the southern parts. When they had made themselves masters of the greatest part of the island, beginning at the south, the Picts from Scythia, as is reported, putting to sea in a few long ships, were driven by the winds beyond the shores of Britain, and arrived on the northern coast of Ireland, where, finding the nation of the Scots, they begged to be allowed to settle among them, but could not succeed in obtaining their request. The Scots answered that the island could not contain them both, but 'we can give you good advice what to do. We know there is another island not far from ours, to the east, which we often see at a distance, when the days are clear. If you go thither you will obtain a settlement, or, if any should oppose, you shall have our aid.' The Picts accordingly, sailing over into Britain, began to inhabit the northern part of the island. In process of time Britain, after the Britons and Picts, received a third nation, the Scots, who, emigrating from Ireland under their leader Renda, either by fair means or force secured those settlements amongst the Picts which they still possess." "There is," he says in another passage, "a very large estuary of the sea which formerly divided the nation of the Picts from the Britons, which gulf runs from the west far into the land, where to this day stands the strong city of the Britons called Alichth. The Scots arriving on the north side of the estuary settled themselves there as in their own country."

This statement in its main points (apart from the country from which the Picts are said to have come) is confirmed by Latin authors, in whose meagre notices the Picts appear before the Scots are mentioned, and both occur later than the Britons, by the legends of the three Celtic races; by the narratives of Gildas and Nennius, the only British Celtic historians, the Irish *Annals*, and the Pictish *Chronicle*. It is in harmony with the facts contained in the *Life of Columba*, written in the 7th century, but based on an earlier *Life*, by one of his successors, Cumma, abbot of Iona, who may have seen Columba, and must have known persons who had. The northern Britain brought before us in connexion with Columba in the latter

half of the 6th century is peopled by Cruithne or Picts in the north and central Highlands, having their chief royal fort on the Ness, and by Scots in Argyll and the Isles, as far north as Iona and on the mainland Drumalban, the mountain ridge which separates Argyll from Perth and Inverness, there is a British king ruling the south-west from the loch on the Clyde then known as Alelyth or Alclyde, now Dumbarton, and Saxony, under Northumbrian kings, is the name given to the district south of the Forth, including the eastern Lowlands, where by this time Angles had settled. The scarcity of Celtic history belonging to Scotland indicates that its tribes were less civilized than their Irish and Welsh kin.

It is in the records of the Christian church that we first touch historic ground after the Romans left. Although the legends of Christian superstition are almost as fabulous as those of heathen ignorance, we can follow with reasonable certainty the conversion of the Scottish Celts. Three Celtic saints venerated throughout Scottish history—Ninian, Kentigern, Columba—Patrick, the patron saint of Ireland, David, the patron saint of Wales, and Cuthbert, the apostle of Lothian and patron saint of Durham, belonging to the Celtic Church, though probably not a Celt, mark the common advance of the Celtic races from heathenism to Christianity between the end of the 4th and the end of the 6th century. The conversion of Scotland in the time of Pope Victor I. in the 3d century is unhistoric, and the legend of St Rule (Regulus) having brought the relics of St Andrew in the reign of Constantine from Achaia to St Andrews, where a Pictish king built a church and endowed lands in his honour, is, if historical at all, antedated by some centuries. There is no proof that amongst the places which the Romans had not reached, but which had accepted Christianity when Tertullian wrote, there was any part of modern Scotland, but, as Christian bishops from Britain without fixed locality begin to appear in the 4th century, possibly the first converts in Scotland had been made before its close.

NINIAN (*qv*), the son of a British chief in Galloway already Christian, after converting or reforming his countrymen—one of his converts being Twidalla, king of Alclyde (? Tothael, father of

1. Of the three branches of the Celts which appear as the first known inhabitants of Scotland the native records are scanty and of late date. Respecting the Britons nothing remains except the *History of Gildas* in the 6th and that of Nennius in the 9th century, of which very small parts relate to Scotland, the poems of Aneurid and Taliesin, commonly called Welsh bards, but perhaps natives of Strathclyde, the lives of saints, and a fragment of criminal law, common to them and the Scots, preserved at the time of its suppression by Edward I. Dealing with the Picts there is a *Latin Chronicle* of the 10th century and additions of later date, containing a valuable list of kings in their own language, and the entries in the *Book of Deer* of the gifts to that monastery by the Pictish monarchs (chiefs) of Buchan, but the earliest of these is in an old form of Gaelic.

The Scots are noticed in the *Life of Columba*, the *Duan Albanach* of the 11th century, a *Latin Chronicle* of the 12th century, a few poems treating of their origin and migration, later Latin tracts describing their settlement in Scotland, and the lives of saints, not written in their existing form till the 12th century. But a considerable amount of legendary material, chiefly consisting of additions to or glosses on the earlier sources, has been collected. When all is told, Scotland has nothing to compare with the Irish *Annals* and the Welsh *Triads*, whose fulness of detail and fabulous antiquity in the early portions raise suspicions as to the later which are perhaps undeserved. It has no equivalent to the collection of laws contained in the *Sinclair's* *Law* or *Kenn's* *Patric of Ireland* and the *Drewnetan* and *Venedetan* codes of Wales, where, in the midst of a crowd of minute customs implying a long settlement in western lands, there are traces of others that seem to have come with the Celts from their far-off Eastern birthplace. From these sources—especially from the Irish *Annals*, and in particular the *Annals of Tigernach*, who died in 1088, the *Synchronisms* of Flann Mainistir, who died in 1056, the *Annals of Innisfallen*, compiled in 1215, and of Ulster, compiled in 1408, but from older authorities—the dearth of proper Scottish material has been supplemented, but this source of information has to be used with caution. The whole materials are collected in the *Chronicles of the Picts and Scots*, edited by Mr Skene for the old clark register of Scotland

Riddick Hall)—and organizing a diocese, went as a missionary to the southern Picts, who lived amongst or near the mountains north of the Forth and Clyde in the modern counties of Stirling, Perth, and Forfar. His fame grew with the church, and as far north as Shetland, as far south as Westmoreland and Northumberland, churches were dedicated in his name. His wonder-working labours in the shrine of Candida Cassa (at Whithorn? in Galloway) became an object of pilgrimages for more than a thousand years. These other missionaries belong to the period between Ninian and Kentigern, his successor amongst the Britons of the west. Palladius, sent to the Christians in Ireland by Pope Celestine, died at Fordun in Meams labouring amongst the Picts, and his disciples Seif and Tynan converted respectively the Picts of Fife and those of the Lowlands of Aberdeen. KIRKMASTON (*qv*) of Strathclyde was supported by Ryldeneck or Roderick, called Hæd ("the Liberal") from Germania, his bounty to the church. Columba visited Kentigern at the cemetery of Ninian, on the Molendun Burn, where countesses were interchanged between these representatives of the two branches of the Celtic Church in western Scotland, shortly before the British bishops deputed at the meeting at St Augustine's oak to submit to the Roman missionary who had converted the Saxons of southern England. Jocelyn of Furness states that Kentigern was at Rome seven times and obtained the privilege of being the pope's vicar free from subjection to any metropolitan. The prince of Cumbria is even said to have acknowledged his precedence. These are inventions of a later age, but the large possessions, extending over the whole western kingdom, conferred by Ryldeneck, and after a long lapse of time found by the request of David I. when prince of Cumbria to have belonged to the church, may be true. He died about the beginning of the 7th century, and a long period of darkness hides the British kingdom and church of Strathclyde. St PATRICK (*qv*), succeeding where Palladius failed, Christianized Ireland in the middle of the 6th century. A passage in his *Confession*, if all of it applies to Scotland, seems to prove the existence of the church in Scotland for two generations before Patrick's birth, and the allowance during these of marriage to the clergy.

Scotland gave Patrick to Ireland, and Ireland returned the gift in Columba. A rare good fortune has preserved in Adamnan's *Life* the tradition of the acts of the greatest Celtic saint of Scotland, and a picture of the monastic Celtic Church in the 6th and 7th centuries,—an almost solitary fragment of history between the last of the Roman and the first of the Anglo-Saxon historians. Born in 521 at Gairn in Donegal, COLUMBA (*qv*) spent his boyhood at Dore, Rathfriland, near Glenties, his youth at Monaghan, and Longwood under Abbot Fintan, called the foster-father of the Irish saints from the number of his disciples. Here he was ordained deacon, and, after completing his education under Gamman, a Christian bard, at the monastery of Clonard, he received priest's orders. In 561 he took part in the battle of Culdrieny (in Connanght), when the chiefs of the Hiberni (Dairi Scots), his kindred, defeated Diarmid (Diarmuid), a king of eastern Ireland. Excommunicated by the synod of Rathfriland in Meath, the country of Diarmid, for his share in the battle—according to one account fought at his instance—and moved by missionary zeal, he crossed two years afterwards the narrow sea which separates Antium from Argyll with twelve companions and founded the monastery of Iona (Hy), on the little island to the west of Mull, given him by his kinsman Connall. The Dalriad Scots, who had settled in the western islands of Scotland, and in Iona early in the 6th century, were already Christians, but Columba soon after visiting them he became a Pictish king, and Malloch, at Crag Phadrach, the isolated hill fort on the Ness, whom he converted, and from whom he received a confirmation of Connall's grant. Columba, on the death of Connall, gave the sanction of religion to the succession of his cousin Aidan, and at the council of Drumcatt in Derry obtained the exemption of the Dalriada of Iona from tribute, though they were still bound to give military service to the Irish king, the head of the Hiberni. He frequently revisited Ireland and took part in its wars, the militant spirit so strongly marked in his character, but most of his time was devoted to the administration of his monastery of Iona, and to the planting of other churches and religious houses in the neighbouring islands and mainland, till his death in 597. None of the remains now found in almost every island—not even those in Iona itself—date from his time, when wood was still used for building. But the original foundations of the churches of Skye and three were his work, those extending from Bute and Caithness—on Islay, Oronsay, Colonsay, Mull, Eggy, Lewis, Harris, Benbecula, and over the distant St Kilda—to Loch Arkay on the northern mainland of Scottish Dalriada are to be ascribed to him or his immediate followers or successors in the abbacy, as well as those in the country of the Picts, from the Orkneys to Deer in Buchan. The churches which received his name far south were later foundations in his honour. The most celebrated of his disciples were Bathene, his successor as abbot, Machar, to whom the church of Aberdeen traces its origin,

2 In a cave at Glasserton road crosses mosaic on stone—probably a font—and the letters SANCTI NI P (?) have recently been found.

Conversion to Christianity

Ninian

Kent.

Cormac, the navigator, the first missionary to the Orkneys, who perhaps landed the Taites and Iceland, and Diostan, the founder of the Scottish monastery of Deer.

Celtic
Church of
Columba

The character of the Celtic Church of Columba was, like its mother church in Ireland, modified by migration to a country only in small part Christian. It was a missionary church, not diocesan but monastic, with an abbot who was a presbyter, not a bishop, for its head, though the office of bishop for ordination existed, and bishops were, in Ireland at least, more numerous than in the later church. It spread, not by the election of parishes and the care of parochial clergy, but by the repopulation of similar monasteries, the homes of those who adopted a religious life, the only schools in an age of war. It preferred islands for its monasteries for safety, and, in the case of its members who sought, in the language of those times, "a desert in the ocean," as hermitages where they might live and die apart from the world. But these were exceptions. The idea of the Celtic monastery was that of a Christian celibate society. Its inmates regarded themselves as being, and often were, members of a family or clan, preserving the customs of their race so far as consistent with celibacy and religious discipline. Of eleven successors of Columba as abbot nine were of his kin. The rule, though its confession is primitive, adapted to an infant and isolated church planted in a heathen world, did not differ greatly from that of later orders. Implicit obedience to the superior, poverty, chastity, hospitality, were the chief precepts. The observance of Easter according to the ancient cycle, the use of the semencular instead of the coenon tonsure, and a peculiar ritual for mass and baptism were its chief deviations from the practice of the catholic church as fixed by the council of Nice, to which it yielded in the beginning of the 8th century, frequent prayer, the singing of psalms and hymns, the reading of Scripture, the copying and illuminating of MSS, the teaching of children and novices, and the labour to provide and prepare the necessary food (the service of women being excluded) were the occupations of the monks. A similar conventual system of which St Bridget, abbess of Kildare, was foundress enlisted the fervour of her sex, and had followers in Dalriada, abbess of Kesh, who founded Alenethy, in Ebbra at Colingham, and in Hilda at Lindisfarne. It was a form of Christianity fitted to excite the wonder and gain the affection of the heathen amongst whom the monks came, practising as well as preaching the self-denying doctrine of the cross. The religion of the Celts is a shadowy outline on the page of history. Notices of idols are rare. They had not the art necessary for an ideal representation of the human form, though they learnt to decorate the rude stone monuments of their age with elaborate tracery. They had no temples. The mysterious circles of massive stones, with no covering but the heavens, may have served for places of worship, as well as memorials of the more illustrious dead. The names of gods are conspicuously absent, though antiquaries trace the worship of the Sun in the Beltane fires and other rites, but in the account of their adversaries we read of demons whom they invoked. Divination by rods or twigs, incantations or spells, strange rites connected with the elements of water and of fire, "choice of weather, lucky times, the watching of the voice of birds," are mentioned as amongst the practices of the Druids, a priestly caste revered for superior learning and, if we may accept Caesar as an authority, highly educated. Thus, rather than fetish or animal worship, appears to have been their cult. It was, so far as scanty indications allow a generalization, by an empirical knowledge of the minor and secondary rather than the greater phenomena of nature that the Druids of Britain and Ireland exercised influence,—the tempest and its elements—wind and rain and snow, thunder and lightning—rather than the sun, moon, and stars. Whatever its precise form, this religion made a feeble resistance to the Christian, taught by the monks, with learning drawn from Scripture and some acquaintance with Latin as well as Christian literature, and enforced by the example of a pure life and the hope of a future world. The charms of music and poetry, in which the Celts delighted, were turned to sacred use. Columba was a protector of the bards,—himself a bard.

"It is not with the 'seoid' nor destiny we,
Nor with the bird on the top of the wing,
Nor with the trunk of a knotted tree,
Nor with a 'seoid' hand in hand.

I adore not the voice of birds,
Nor the 'seoid' nor destiny nor lots in this world,
Nor a son nor chance nor woman,
My Druid is Christ the Son of God,
Christ, Son of Mary, the Great Abbot,
The Father, the Son, and the Holy Ghost."

Adamnan relates miracles of Columba scarcely above the level of the practices of the bards. But superstition was not vanquished by superstition. Celibacy was a protest against the promiscuous intercourse for which Christian fathers condemn the Celts. Fasts and vigils contrasted with the gross, perhaps cannibal, practices still in use. The intense faith in Christ, of lives such as Patrick's and Columba's, won the victory of the cross.

When we pass to civil history our knowledge is restricted 597-685 to a list of names and battles, but the labours of recent scholars allow a brief account of the Celtic races from the end of the 6th to their union in the middle of the 9th century, in part hypothetical, yet a great advance on the absolute blank which made historians of the 18th century decline the task in despair.

The Britons, whose chief king had ruled at Ailech, Britons were separated from their fellow-countrymen, the Cymry in Wales, shortly after Columba's death by the rapid advance of the Anglian kingdom of Northumberland, founded in the middle of the 6th century by Ida of Damborough. One of his successors, Eithelfred, struck the blow, completed by the wars of the next king, Edwin, which severed modern Wales from British Cumbria and Strathclyde. Even Mona, the holy isle of both heathen and Christian Britons, became Anglesey, the island of the Angles. A later incursion towards the end of the century reached Carlisle and separated the kingdom of Ailech, which had for its boundary the Catrail or Picts' trench between Peel Fell and Galashiels, from English Cumbria (Cumberland south of the Solway), and reduced for a short time Strathclyde to a subject province. When Bede wrote in 731 an Anglian bishopric had been established at Whitthorn, which continued till 803. The decline of the Northumbrian kingdom in the 8th century enabled the kings of Strathclyde to reassert their independence and maintain their rule within a restricted district more nearly answering to the valley of the Clyde, and in Galloway, in which there are some faint indications of a Pictish population, till it was united to the kingdom of Soane by the election of Donald, brother of Constantine II, king of the Scots, to its throne.

Of the Scots of Dalriada somewhat more is known. Their history is interwoven with that of the Picts and meets at many points that of the Angles of Northumberland, who during the 7th and the beginning of the 8th century, when their kings were the greatest in Britain, endeavoured to push their boundaries beyond the Forth and the Clyde. The history of this kingdom—see NORTH-NORTHUMBRELAND (KINGDOM) or—forms part of that of Scotland during these centuries. It planted in Lothian (q.v.) the seed from which the civilization of Scotland grew. To an early period of the contest between the Angles and the Britons, and to the country between the Forth and the Tweed and Solway, perhaps belong the battles magnified by successive poets who celebrated the hero of British mediæval romance. Whether these battles were really fought in southern Scotland and on the borders, and Arthur's Seat was one of his strongholds, still "unknown is the grave of Arthur." Before Edwin's death (633) his kingdom extended to the Forth, and the future capital of Scotland received the name of Edwinesburgh from him in place of the Mynyrd Agned and Dunedin of the British and Gaelic Celts. During the reign of Oswald (635-642) the Northumbrians were reconquered by Aidan, a monk whom Oswald summoned from Iona, and who became monastic bishop of Lindisfarne—a southern Iona—from which the Celtic form of the Christian church spread amongst the Angles of the north and east of England, until the council of Whitby and the election of Wilfrid to the see of York restored the Roman ritual and diocesan episcopacy, when Colman, their Celtic bishop at Lindisfarne, retired with his monks to Iona. Oswald's brother Oswy extended the dominion of Northumberland over a portion of the country of the northern Picts beyond the Forth. In his reign lived CUTHBERT (q.v.), the apostle of Lothian, where the monastery of St Abba at Colingham, the church on the Bass, the three churches of St Baldred at Auldharn, Tynninghame, and Preston, and the sanctuary of Wedale (Stow) kept alive the memory of the Celtic Church. His name

655-756. is preserved in St Cuthbert's church at Edinburgh and in Kirkcubright. To the same period belong two inscriptions, the earliest records of Anglian speech, one on the cross of Bewcastle in Cumberland, commemorating Alfred, a son of Oswy, the other, taken perhaps from a poem of Caedmon, at Ruthwell in Dumfries. Neither the Tweed nor the Solway was at this period a line of division. Oswy was succeeded by his son Ecgfrid (685), against whom the Picts successfully rebelled, and the Scots and a considerable part of the Britons also recovered their freedom. Anglian bishops, however, continued to hold the see of Whithorn during the whole of the 8th century. The Northumbrian kings, more successful in the west than in the east, gradually advanced from Carlisle along the coast of Ayr, and even took Airdrie. In what is now England their power declined from the middle of the 8th century before the rise of Mercia. Shortly before the commencement of the 9th century the descents of the Danes began, which led to the conflict for England between them and the Saxons of Wessex. The success of the latter under Alfred and his descendants transferred the supremacy to the princes of the southern kingdom, who, gradually advancing northwards, before the close of that century united all England under their sceptre.

Before its fall Northumberland produced three great men, the founders of English literature and learning, though two of them wrote chiefly in Latin.—Caedmon, the monk of Whitby, the first English poet, Bede, the monk of Jarrow, the first English historian, and Alcuin, the monk of York, whose school might have become the first English university, had he not lived in the decline of Northumbrian greatness and been attracted to the court of Charlemagne. It is to this early dawn of talent among the Angles of Northumberland that England owes its name of the land of the Angles and its language that of English. The northern dialect spoken by the Angles was the speech of Lothian, north as well as south (in Northumberland) of the Tweed, and was preserved in the broad Scotch of the Lowlands, while modern English was formed from the southern dialect of Alfred, Chaucer, and Wycliffe. This early Teutonic civilization of the lowland district of Scotland, in spite of the Danish wars, the Celtic conquest, and border feuds, never died out, and it became at a later time the centre from which the Anglo-Saxon character permeated the whole of Scotland, without suppressing, as in England, the Celtic. Their union, more or less complete in different districts, is, after the difference in the extent of the Roman conquest, the second main fact of Scottish history, distinguishing it from that of England. Both, to a great degree, were the result of physical geography. The mountains and arms of the sea repelled invaders and preserved longer the ancient race and its customs.

It is necessary, before tracing the causes which led to the union of races in Scotland, to form some notion of northern Scotland during the century preceding Kenneth Macalpine, during which—the light of Adamnan and Bede being withdrawn—we are left to the guidance of the Pictish *Chronicle* and the Irish *Annals*. The Picts whom Columba converted appear to have been consolidated under a single monarch. Brude, the son of Mallochon, ruled from Inverness to Iona on the west and on the north to the Orkneys. A sub-king or chief from these islands appears at his court. The absence of any other Pictish king, the reception of the Columbite mission in Buchan under Drostan, a disciple of Columba, and perhaps Columba himself, the foundation of the church of Mordach near Aberdeen by Machar, another of his disciples, favour the conclusion that the dominion of Brude included Aberdeen as well as Moray and Ross. Its southern limits are unknown.

The Picts¹ of Stirling, Perth, and Forfar, corresponding to Strathcan and Menteth,—Athole and Gowrie, Angus and Mearns, had been already converted by Ninian in the 5th century—may have already come under a single king ruling perhaps at Abernethy, with morimers under him. It seems certain that Abernethy was earlier than Dunkeld a centre of the Celtic Church distinct from Iona, and the seat of the first three bishops of Scotland. Its round tower cannot be safely ascribed to an earlier date than the 9th century, but may have been preceded by a church dedicated to St Bridget either in the 5th by Nechtan Morbet, or in the 6th century by Garnard, son of Donald, a later Pictish king. Although there exists a complete list of the Pictish kings from Brude, son of Mallochon, to Brude, son of Feat, conquered by Kenneth Macalpine, and of the Scots of Dalruda from Aidan (converted by Columba) to Kenneth Macalpine, with their regal years, it is only here and there that a figure emerges sufficiently distinct to enter history. Parts of these lists are fictitious and others doubtful, nor do we know over what extent of country the various monarchs ruled. Of the figures more or less prominent amongst the Pictish kings are Brude, the son of Deil, the contemporary of Adamnan, who was present at the synod of Tara when the law called Kan Adamnan, freeing women from military service, was adopted, and who died in 706, being then styled king of Fortren. Nechtan, another son of Deil, was the contemporary of Bede, who gives (710) the letter of Ceolfrid, abbot of Wearmouth, to him when he adopted the Roman Easter and the tonsure. Six years later Nechtan expelled the Columbite monks from his dominions. They retired to Dalruda, as their brethren in Northumberland had done when a similar change was made by Oswy. Nechtan also asked for masons to build a church in the Roman style, to be dedicated to St Peter, and several churches in honour of that apostle were founded within his territory. Shortly after, Egbert, an Anglian monk, persuaded the community of Hy (Iona) itself to conform, but too late to lead to the union of the churches of the Scots and the Picts, which were separated also by political causes.

Fifteen years later the greatest Pictish monarch, Angus MacFergus, after a contest with more than one rival, gained the supremacy, which he held for thirty years (731-761). In revenge for the capture of his son Brude by Dungal, son of Selvaich, king of the Dalriad Scots, he attacked Argyll, and laid waste the whole country, destroying Dunnad (on Loch Crinan), then the capital, burnt Creich (in Mull), and put in chains Dungal and Feradach, the sons of Selvaich. He next conquered (739), and it is said drowned, Talorgan, son of Diostan, king of Athole, one of his rivals, and, resuming the Dalriad war, reduced the whole of the western Highlands. The Britons of Strathclyde were assailed by a brother of Angus, who

Early
Pictish
annals

¹ But there had been a time when not one but several Pictish kings ruled the northern and central districts of Scotland, and of this we have perhaps a trace in the Pictish legend according to which Cruathne, the eponymus of the race, had seven sons,—Cait, Ceo, Curo, Fio, Fidach, Fotia, Fortren. Conjecture identifies five of these names with districts known in later history,—Cait with Cathness, Curo with Mearns (Mach Creran, the plaid of Curo), Fio with Fife, Fotia with Athole (Athfola), Fortren with southern Perthshire, connecting it with a division of the same county in a tract of the 12th century (Comp. plate VI.) Six of the divisions—Angus and Mearns, Athole and Gowrie, Strathcan and Menteth, Fife and Fortren, Mar and Buchan, Moray and Ross—fairly correspond to districts afterwards ruled by the Celtic morimers of Angus, Athole, Strathcan, Fife, Mar, and Moray. Cathness in the 9th century became Norse, and a new rail (of Mach) was introduced from the north of the Forth. They correspond also to seven great seigniories of Scotland, which appear with more or less distinctness on several occasions in the reigns of the Alexanders. This, at least, is a highly ingenious theory, but not certain history.

fell in battle at Mucedon in Striding, and Angus, with his ally Ebert, king of Northumberland, retaliated by burning Aldryde (756). About this time (752) Colm Droughteach (the Bridgenaker), abbot of Iona, removed most of the relics of his abbey to Ireland, and this is the most probable date of the legend of the relics of St Andrew being brought from Patras to St Andrews, where the sons of a Pictish king, Hungus (Angus MacFergus), who was absent in Argyll, or, according to another version, Hungus himself, dedicated Kilgrimgont (St Andrews) and the district called the Boars Chase to St Andrew. The ascription of the foundation to an earlier king of the same name in the 4th century was due to the wish to give the chief bishopric of Scotland an antiquity greater than Iona and Glasgow, greater even than Canterbury and York. After the death of Angus MacFergus no king is connected with any event of importance except Constantine, son of Fergus (died 820), who is said to have founded the church of Dunkeld, —226 years after Garnard, son of Donald, founded Abernethy. This fact, though the earlier date is not certain, points to the Perthshire lowlands as having been for a long time the centre of the chief Pictish monarchy. Probably Scone was during this period, as it certainly became afterwards, the political capital, and the kings latterly are sometimes called kings of Fortren. If so, the chief monarchy under the pressure of the Norse attacks had passed south from Inverness, having occupied perhaps at various times, Dunottar, Brechin, Forfar, Forteviot, and Abernethy as strongholds, but it is not possible to say whether there may not have continued to be independent Pictish rulers in the north.

The annals of Dalriada are even more perplexing than those of the Picts after the middle of the 6th century. There is the usual list of kings, but they are too numerous, and their reigns are calculated on an artificial system. The forty kings from Fergus MacEarc to Fergus MacFerchard, who would carry the date of the Scottish settlement back to three centuries at least before the birth of Christ, have been driven from the pale of history by modern criticism. The date of the true settlement was that of the later Fergus, the son of Earc, in 503. From that date down to Selvach, the king who was conquered by Angus MacFergus about 780, the names of the kings can be given with reasonable certainty from Adamnan, Bede, and the Irish *Annals*. But the subsequent names in the Scottish chronicles are untrustworthy, and it is an ingenious conjecture that some may have been inserted to cover the century following 780, during which Dalriada is supposed to have continued under Pictish rule. This view is not free from its own difficulties. It is hard to explain how Kenneth Macalpine, called by all Scottish records a Scot, though in Irish *Annals* styled (as are several of his successors) king of the Picts, succeeded in reversing the conquest of Angus MacFergus and establishing a Scottish line on the throne of Scone, in the middle of the 9th century. This difficulty is supposed to be solved by the hypothesis that Kenneth was the son of a Pictish father, Alpine, but of a Scottish mother, and was entitled to the crown by a peculiarity of Pictish law, which recognized descent by the mother as the test of legitimacy. The records which speak of the destruction of the Picts are treated as later inventions, and it is even doubted whether the connexion between Alpine and Kenneth and the older race of Dalriad kings is not fictitious.¹

¹ The above statement is a brief outline of the reconstruction of this period of Scottish history due to two scholars who have done more than any others to elucidate it, Father Innes and Mr Skene. Their negative criticism, which destroys the fabric reared by a succession of historians from Fordun or his continuator Bowermaker to Buchanan, is a masterly work, not likely to be superseded. Whether the constructive part will stand is not certain, but it explains many of the facts

Whatever may be the solution ultimately reached as to 756-867 Kenneth Macalpine's antecedents, his accession represents a revolution which led by degrees to a complete union of the Picts and Scots and the establishment of one kingdom —at first called Albania and afterwards Scotia—which included all Scotland north of the Forth and Clyde, except Carliness, Sutherland, Orkney and Shetland (the northern isles or Nordreyar), the Hebrides (the southern isles or Sudreyar), and Man, these fell for a time into the hands of the Norsemen. This revolution had two causes or concomitants, one religious and the other political. Kenneth Macalpine in the seventh year of his reign (851) brought the relics of St Columba from Iona to a church he built at Dunkeld, and on his death he was buried at Iona. A little earlier the Irish Culdees, then in their first vigour, received their earliest grant in Scotland at Loch Leven from Brude, one of the last kings of the Picts, and soon found their way into all the principal Columbite monasteries, of which they represent a reform. The Irish monastic system did not yet give place to the Roman form of diocesan episcopacy. The abbot of Dunkeld succeeded to the position of the abbot of Iona, and held it until the beginning of the 10th century, giving ecclesiastical sanction to the sovereign at Scone, as Columba had done in the case of Aidan. As early as the beginning of the 8th century, however, a Pictish bishop of Scotland appears at a council of Rome, and he had at least two successors as sole bishops or primate of the Celtic Church before dioceses were formed. Scotland north of the firth thus remained at a lower stage of church organization than England, where a complete system of dioceses had been established in great part answering to the original Anglo-Saxon kingdoms or their divisions, with Canterbury and York at their head as rivals for the primacy. But the Celtic clergy who now conformed to the Roman ritual preserved some knowledge of the Latin language, and a connexion with Rome as the centre of Latin Christianity, which was certain to result in the adoption of the form of church government now almost universal. The other circumstance which had a powerful influence on the foundation of the monarchy of Scone and the consolidation of the Celtic tribes was the descent on all the coasts of Britain and Ireland of the Norse and Danish vikings. The Danes chiefly attacked England from Viking Northumberland and along the whole east and part of the southern seaboard, the Norsemen attacked Scotland, especially the islands and the north and west coasts, going as far south as the Isle of Man and the east and south of Ireland. It had now become essential to the existence of a Scottish Celtic kingdom that its centre should be removed farther inland. Argyll and the Isles, including Iona, were in the path of danger. No monk would have now chosen island homes for safety. In 787 the first arrival of the viking ships is noticed in the *Anglo-Saxon Chronicle*. Some years later the Irish *Annals* mention that all "the islands of Britain were wasted and much harassed by the Danes." Amongst these were Lindisfarne, Rathlin off Antrim, Iona (794), and Patrick's island near Dublin (798). Iona was thrice plundered between 802 and 826, when Blathmac, an abbot, was killed. A poem composed not long after the event states that the shrine of Columba was one of the objects in search of which the Norsemen came, and that it was concealed by the monks. It was to preserve the relics from this fate that some of them were transferred by Droughteach, the last abbot, to Ireland and others by Kenneth to Dunkeld. For half a century the vikings were content with plunder, but in the middle of the 9th they began to form settlements. In 849 Olaf the White established himself at Dublin as king of Hth Ivar; in 867 a Danish kingdom was set up in Northumberland,

Union of
Picts and
Scots

867-914 and Harold the Fairhaired, who in 872 became sole king of Norway, soon after led an expedition against the vikings, who had already seized Orkney and Shetland, and established an earldom under Rognwald, earl of Mærr, whose son Hloif the Ganger conquered Normandy in the beginning of the next century. The position of Scotland, therefore, when Kenneth united the Picts and Scots was this—central Scotland from sea to sea—Ayrill and the Isles, Perthshire, Angus and Mearns, and Fife—was under the dominion of the king who had Scone for his capital, the south-west district—the valley of the Clyde, Ayr, Dumfries, and Galloway—was under a British king at Dumbarton, the south-east district or Lothian was part of "Saxon or Sassenach Land,"—the general Celtic name for the country of the Anglo-Saxons, but now owing to the divided state of Northumberland held by different lords, the north of Scotland was under independent Celtic chiefs, as Moray and Mar, or already occupied by Norsemen, as Caithness, Orkney and Shetland, and the Hebrides. The whole Celtic population was Christian, but the Norse invaders were still heathen. Their religion was similar to that of their Anglo-Saxon kin, of a type higher than the paganism of the Celts. It resembled the Celtic indeed in the absence or infrequency of idols, but a complex mythology peopled heaven with gods—Woden and Thor, Freya and Balder, and others of inferior rank—devised legends of the origin of earth and man, Valhalla the hero's paradise, and a shadowy hall for all who were not heroes. Some of its legends are coloured from Christian sources, and underneath the mythology may be detected a ruder and more ancient superstitious belief in omens and divination,—a nature-worship more like that of the Celts. But it is the latter form which represents the Norse character as it was when it came into contact with the nations of Britain,—its daring defiance of man and the gods, its struggle with, yet in the end its calm acceptance of, the decrees of fate. The Norsemen both at home and in their colonies in Scotland embraced Christianity under Olaf Trygvason in the end of the 10th century, but along with Christianity they retained the old heathen sentiments and customs, which, like their language, mingled with and modified the Celtic character on the western but far more on the northern coasts and islands, where the population was largely Norse. A strain neither Celtic nor Teutonic nor Norman occasionally meets us in Scottish history—it is derived from the blood or memory of the Norse vikings.

Kenneth Macalpine 3 *Later Celtic Period. Growth of the Kingdom of Scone from Kenneth Macalpine to Malcolm Canmore.*—During this period, though the Celtic annals are still obscure, we can trace the united Celtic kingdom growing on all sides under Kenneth's successors,—southward by the conquest of Lothian on the east and by the union of the Strathclyde kingdom on the west, and for a time by holding English Cumbria under the English kings, and northward by the gradual incorporation of Angus, Mearns, Moray, and possibly the southern district of Aberdeen. Kenneth Macalpine's reign of sixteen years (844-860) was a time of incessant war. He invaded Saxony (Lothian) six times, burnt Dunbar, and seized Melrose (already a rich abbey, though on a different site from the Cistercian foundation of David I.), while the Britons (of Strathclyde) burnt Dunblane and the Danes wasted the land of the Picts as far as Cluny and Dunkeld. After they left, Kenneth rebuilt the church of Dunkeld and replaced in it Columba's relics. He died at Forteviot and was buried at Iona.

Donald II. He was succeeded by his brother Donald I. (861-863), who, with his people the Gaels, established the laws of Aed, son of Eadachach, at Forteviot. Aed was a Dalriad king of the 8th century, but the contents of his laws are unknown.

Perhaps tanistry, by which the successor to the king was elected during his life from the eldest and wealthiest of his kin, usually a collateral in preference to a descendant, was one feature, for it certainly prevailed amongst the Irish and Scottish Gaels. The next king, who succeeded in accordance with that custom, was Constantine I. (863-877), son of Kenneth. His reign was occupied with conflicts with the Norsemen. Olaf the White, the Norse king of Dublin, laid waste the country of the Picts and Britons year after year, and in 870 reduced Ailech, the British capital; but, as he disappears from history, he probably fell in a subsequent raid. He is said to have married a daughter of Kenneth, and some claim in her right may account for his Scottish wars. In the south the Danish leader Haldan devastated Northumberland and Galloway, while in the north Thorstein the Red—a son of Olaf by Audur, the wealthy daughter of Ketil Flaknose (called Finn, "the Fair," by the Celts), a Norse viking of the Hebrides, who afterwards went to Iceland and figures in the sagas—conquered the coast of Caithness and Sutherland as far as Ekkilask Bakki (the Oikel). But he was killed in the following year. Constantine met with the same fate at a battle at Inverdot in Fife in 877, at the hands of another band of northern marauders. His death led to a disputed succession. His heir, according to the custom of tanistry, was his brother Aodh, who was killed by his own people after a year. Eoch, the son of Run, a king of the Britons, claimed in right of his mother, a daughter of Kenneth, according to the Pictish law, and governed at first along with Ciric or Grig, his tutor, then Grig ruled alone, until they were both expelled from the kingdom and Donald II, son of Constantine, came to the throne (889). The Pictish *Chronicle* reports that during the government of Grig the Scottish Church was freed from subjection to the laws of the Picts (meaning probably from liability to secular service). Grig is also said to have subdued all Bernicia and "almost Angles," a statement which if confined to the north of the Northumbrian kingdom is not improbable, for it had then fallen into anarchy through the attacks of the Danes. The church of Ecclesgreig near Montrose possibly commemorates Grig, and indicates the northward extension of the monarchy of Scone. In the reign of Donald II (889-900), son of Donald Constantine I, Scotland was again attacked by the Norsemen. Sigurd, the Norse earl of Orkney, seized Caithness, Sutherland, Ross, and part of Moray, where he built the fort of Burghhead, between the Findhorn and the Spey. Farther south the Danes took Dunnotar, where Donald was slain. After his time the name of the kingdom of Scone was no longer Pictavia, but Albania or Alba, a more ancient title of northern Scotland, perhaps resumed to mark the growth of the Scottish-Pictish monarchy in the central and eastern Highlands.

Donald II was followed by Constantine II. (900-940), Constantine's son and grandson of Kenneth, and his long reign is a proof of his power. He was the greatest Scottish king, as Angus MacFergus had been the greatest of the pure Pictish race. In the first part of it his kingdom was still beset by the Norsemen. In his third year they wasted Dunkeld and all Alba. Next year they were repulsed in Strathearn. In his 8th year Rognwald, the Danish king of Dublin, with earls Ottir and Oswie Craikatan, ravaged Dunblane. Six years later the same leaders were defeated on the Tyne (1 in East Lothian) by Constantine, who had been summoned to assist Eldred, lord of Bamborough. Ottir was slain, but Rognwald escaped and reappears some years later as king of Northumberland. This is a battle whose site and incidents are told in a conflicting manner by different chronicles, but it appears certain that Constantine saved his dominions from further

serious attacks by the vikings. He had now to meet a more formidable foe,—the West Saxons, whose kings, the descendants of Alfred, were steadily moving northwards. In spite of his wars, Constantine found time in the early part of his reign for two important reforms,—one ecclesiastical, the other civil. In his sixth year (906) he, along with Cellach, bishop of St Andrews—the first of twelve Celtic bishops of Scotland—swore on the Hill of Faith at Scone (906) that “the laws and discipline of the faith, and the rights of the churches and the gospel, should be preserved on an equal footing with the Scots.” This obscure notice of the Pictish *Chronicle* indicates the establishment or restoration of the Scottish Church, which the Pictish kings had oppressed, to an equality with that of the Pictish. As a sign of the union the crozier of St Columba, called Cathbadh (“victory in battle”), was borne before Constantine’s armies. Two years later, on the death of Donald, king of the Britons of Strathclyde, Constantine procured the election of his own brother Donald to that kingdom. Though he thus strengthened church and state, Alfred’s successors were too powerful for him. The *Anglo-Saxon Chronicle* records of Edward the Elder, that in 924, having built a fort at Bakewell, in the Peak of Derbyshire, “the king and nation of the Scots, Rognwald the Northumbrian and others, and also the king of the Strathclyde Welsh and his people, chose him for father and lord.” His son Athelstan is related by the same authority to have subjugated all the kings in the island, amongst whom are mentioned by name Howell king of the west Welsh, Constantine king of the Scots, Owen king of Gwent, and Eldred of Bamborough, who “made peace with oaths at Emmet and renounced every kind of idolatry.” These entries are not beyond suspicion. The Peak was a distant point for the Scottish king. Rognwald, the Northumbrian, died in 920, according to the Irish *Annals*. Howell and Constantine were already Christians and could not have then renounced idolatry. If there is any truth in the submission of the Scots to Edward the Elder it did not last, for some years later the *Chronicle* states that Athelstan went into Scotland with a land and sea force and ravaged a great part of it. A league of the northern kings against Athelstan was dispersed (937) by his great victory at Brunanburgh (Wendun, between Aldborough and Knaresborough, according to Skene). The forces allied against him were those of Constantine, his son-in-law Olaf, son of Sitric (called also the Red), and another Olaf, son of Godfrey, from Ireland, besides the Strathclyde and north Welsh kings. For Athelstan there fought, in addition to his own West Saxons, the Mercians and some mercenaries from Norway, amongst them Egl, son of Skalagrim, the hero of a famous Icelandic saga. No greater slaughter had been known since the Anglo-Saxons, “proud war-smiths,” as their poet calls them, overcame the Welsh and gained England. A son of Constantine was slain, four kings, and seven earls. Constantine himself escaped to Scotland, where in old age he resigned the crown for the tonsure and became abbot of the Culdees of St Andrews. Athelstan died two years after Brunanburgh, but before his death granted Northumberland to Erik Bloody-Axe, son of Harold Haarfagr, who was almost immediately expelled by the Irish Danes. Athelstan, even after so great a victory, could not annex Northumberland, much less Scotland, to his dominions.

Malcolm I. Constantine’s successor, Malcolm I. (943-954), son of Donald II, began his reign by invading Moray and killing Cellach, its chief king. Meantime the Danish kings of Dublin had been endeavouring to maintain their hold on Northumberland with the aid of the Cumbrians, whose country they had already settled, and in this attempt the two Olafs had a temporary success, but Eadmund, the

successor of Athelstan, expelled Olaf, son of Sitric, from Northumberland, and in the following year, to prevent the Cumbrians from again aiding the Danes, he “harrid Cumberland and gave it all up to Malcolm, king of Scots, on condition that he should be his fellow-worker both on sea and land.” This was the same policy which led his father to call in the aid of Erik Bloody-Axe. The kings of Wessex wisely granted what they could not hold to the best northern warrior, Celt or Scandinavian, under conditions which acknowledged more or less strictly their supremacy. The Cumbrina so granted was the country south of the Solway to the Dee, but it may also have included Strathclyde, for at this period Strathclyde Waelas and Cumbrians are frequently used as equivalent names. Malcolm lent no aid to Erik Bloody-Axe, when in the reign of Eadred he tried (949) to recover Northumberland, but he joined his brother-in-law Olaf, Sitric’s son, in an expedition with the same object, when they laid waste the country as far south as the Tees. Three years later Erik again returned, and finally drove Olaf back to Ireland, where he founded the kingdom of Dublin, which lasted till the battle of Clontarf. Malcolm died fighting either against the men of Meams or of Moray. Three kings followed (954-971).—Indulf, son of Constantine, Duff, son of Malcolm, Colin, son of Indulf, in the reign of Indulf the Northumbrians evacuated Edinburgh, which thenceforward was Scottish ground. A Saxon burgh, a fort, perhaps a town, was now for the first time within the Celtic kingdom.

Kenneth II (971-995), son of Malcolm, soon after his accession made a raid on Northumberland as far south as Cleveland. The statement of two English chroniclers (John of Wallingford and Henry of Huntingdon), that Lothian was ceded to him by Eadgar on condition of homage, and that the people should still use the language of the Angles, is not mentioned in the Anglo-Saxon or any Scottish chronicle. Nor is it easy to believe the *Anglo-Saxon Chronicle* as amplified by Florence of Worcester, that Kenneth was one of the kings who rowed Eadgar on the Dee in sign of homage. At this time, in the north and west, the Orkney earls were all-powerful, and Kenneth was occupied with contests nearer his own territory,—especially with the mormaer of Angus, whose grandson, through his daughter Fenella, he slew at Dunsinane, and in revenge for which he was himself treacherously killed at Fettercairn in Meams by Fenella, whose name is still preserved in the traditions of that district. The foundation of the church at Brechin is attributed to this king.

Kenneth was followed, as he had been preceded, by insignificant kings,—Constantine, son of Colin, and Kenneth, son of Duff. His son, Malcolm II (1005-34), gained Malcolm the throne by the slaughter of his predecessor Duff at Monzevard, and at once turned his arms southwards, but his first attempt to conquer northern Northumberland was repelled by Ethelred, son of Waltheof, its earl, who defeated him at Durham. About the same time Sigurd, earl of Orkney, having defeated Finlay, mormaer of Moray, became ruler, according to the Norse saga, of “Ross and Moray, Sutherland and the dales” of Caithness. He had conflicts with other Scottish chiefs, but appears to have made terms with the kings of both Norway and Scotland,—with Olaf Trygvason by becoming Christian and with Malcolm by marrying his daughter. He fell at Clontarf (1014), the memorable battle near Dublin, by which Brian Boru and his son Murcadh defeated the Danish kings in Ireland and restored a Celtic dynasty. Malcolm conferred the earldom of Caithness on his grandson Thorfinn, the infant son of Sigurd, and Sigurd’s Orkney saildom fell to his sons, Somerled, Brus, and Einar, while Moray again

1014-1065 came into the possession of a Celtic morrhar, Finlay, who is called king of Alba by one of the Irish chronicles, and the Hebrides probably into that of a Norse earl, Gille, from whom they were afterwards recovered by Thorfinn. While the Celts of Ireland were thus expelling the Danish invaders and in Scotland there was divided possession, the result of compromise and of intermarriage, England fell under the dominion of the Danish kings Sweyn and Canute. Canute committed Northumberland to Erik, a Dane, as earl, but Eadulf Cudwe, a weak brother of the brave Oswulf and of Wulthof, the Anglian earl, still retained the northern district as lord of Bamborough. Profiting by the distracted state of northern England, Malcolm again invaded Northumbria with Owen of Cumbria, called the Bald, and by the victory of Caithness (1018) near Coldstream won Lothian, which remained from that time an integral part of Scotland. Canute, on his return from a pilgrimage to Rome, is said by the *Anglo-Saxon Chronicle* to have gone to Scotland, where Malcolm and two other kings, Maelbeth and Jehmarc, submitted to him, but he held Scotland for only a little while. Maelbeth is supposed to be Macbeth, then morrhar of Moray, afterwards king, and Jehmarc, a Celtic or Scandinavian chief in Argyll. The hold which Canute, who was trying to grasp Norway and Denmark as well as England, had upon northern Britain must have been slender as well as short, but the acknowledgment of the supremacy of so great a king was natural. At his death his overgrown empire fell to pieces, and Scotland was left to itself. Two years before Malcolm II died. His conquest of Lothian perhaps led to the new name of Scotia (now generally applied to his kingdom), which was to become its permanent name. The Scotland he governed still had its centre at Scone, but included besides the original Pictish district of Perthshire, Angus and Mearns, Fife, the southern district of Aberdeen, and Lothian, his own conquest, while Moray and western Ross, and perhaps Argyll and the Isles, owned his suzerainty. But the Norse earl, Thorfinn, at this time held the Orkneys, Caithness, Sutherland, and the Hebrides. Whether a Cumbrian king still ruled Strathclyde and Galloway is doubtful. After Owen the Bald, who fought at Caithness, the next king mentioned is Duncan, son of the grandson and the successor of Malcolm. Malcolm II. was liberal to the church, as we know from his gifts to the church of Deer, but the foundation of Mortlach (Banffshire), the future see of Aberdeen, belongs to the reign of Malcolm Canmore. The laws attributed to him are spurious, introducing into the Celtic kingdom a fully developed feudalism, which was not known in England, still less in Scotland, till after the Conquest. As he left no male heir, Malcolm's death led to a doubtful succession and a perplexed period of Scottish history.

The Scottish historians and the Norse sagas can with difficulty be reconciled. Little light can be got from either the *Anglo-Saxon Chronicle* or the Irish *Annals*. Shakespeare seized the weird story of Macbeth, as told by Boece and translated in Holme's, and history can hardly displace the tragedy, so true to the dark side of human nature, by the meagre outline at its command. This outline is supported by authentic evidence, and agrees with the situation which existed between the death of Malcolm II. and the accession of Malcolm Canmore.

Duncan Malcolm II was succeeded by his grandson Duncan (1034-40), son of his daughter Bethoc and Crinan, a lay or secular abbot of Dunkeld, but his right was probably from the first contested by Thorfinn, who had become the most powerful of the Norse earls. If the Orkney saga could be relied upon, he had as many as eleven ears or morrhars subject to him, and a modern but unsafe in-

terpretation of one passage extends his dominion as far as Galloway. Duncan, after an unsuccessful attempt on Durham, turned his arms to the north to check the further advance of his kinsman, but was defeated on the Pentland Firth. Moddan, whom he had tried to set up as earl of Caithness, was burnt in his own house, and Duncan himself was killed at Bothgowan near Elgin by Macbeth, his own general. Macbeth was son of Finlay, morrhar of Moray, and his wife Gruoch was daughter of Boete, son of Kenneth II., thus he had a possible pretension to the crown if it could descend by females. But his real position appears to have been that of a successful general asserting the independence of the northern Celts against Duncan, who by his marriage with the daughter of Earl Sward, the Northumbrian earl, had shown the tendency to unite Saxon with Celtic blood which was followed by his son Malcolm (III.) Canmore. Macbeth reigned seventeen years (1040-57). He was, as far as records state, an able monarch, who succeeded in repelling the attacks of Sward on behalf of his grandson, who showed liberality to the church, as the foundation of himself and his wife at Loch Leven testify, sent money for the poor to Rome, and possibly went with it on a pilgrimage, but he fell at last in the battle of Lulmahnan in Mar, where the young Malcolm was aided by Fostig, son of Godwins, the great West Saxon earl who had become earl of Northumberland. A few months later, Lulach, the son of Gillecomhain, a former morrhar of Moray, who had continued the war, and is nominally counted a king, though called factious, was slain at Essie in Strathgobro (N.W. Aberdeen), and Malcolm Canmore became king. With his reign a new and clearer era of the history of Scotland commences.

The Scottish Gaels had proved themselves capable of government. The united monarchy of Scone lasted for two centuries in arduous spite of its powerful neighbours, but it was dependent almost Scone entirely on the attachment of the clans to their chiefs and of the whole race to the hereditary king. It was traditional, not constitutional, with some accepted customs, otherwise it could not have held together, but with little settled law and no local government. It wanted the elements of civil life, for it had no organized towns or assemblies of the people. There was little commerce or trade. Cattle and sheep were the chief commodities and the medium of exchange. There is no trace of an independent coinage. Christianity had not yet leavened the whole population, though the monasteries were centres of light within limited circles. The Celtic character, alien to set and quick forms of business, was Celtic alive to the pleasures of the imagination, of story, and song. Its cardinal defect was a light regard for truth. Its chief virtue was Anglo-devotion to a leader, whether priest, chief, or king. The Christian Saxon Anglo-Saxons of the Lothians, the Norsemen, only recently and character had converted, in the islands of the north and west, brought their laws and customs into the common stock of the future Scottish people, which was wanting to the Celts. The Anglo-Saxon in his original home, as in Britain the inhabitant of the plain—"the creeping Saxon," as he was called by an Irish bard—developed in the house and the town a better regulated freedom,—the domestic and civic virtues. His imagination, even his poetry, had a touch of prose, but he possessed the precise qualities of plain speech, common sense, and truth,—the essence of trust. The conflict—for it was a contest, not a conquest—with this race was of the highest value to the Scottish nation of the future. The Normans introduced new elements, the spirit of chivalry and the too rigid bonds of the feudal law. The changes due to these new elements began in Scotland in the reign of Malcolm Canmore, and were completed in those of his descendants. The Scottish Celtic kingdom became gradually civilized under Saxon and Norman influences, while retaining its native vigour. The result was the establishment of the independence of Scotland within its present bounds during the prosperous reigns of the Alexanders (1107-1285).

4. Transition from a Celtic to an Anglo-Norman Feudal Malcolm Morarck. Malcolm Canmore and his Descendants.—117 Canmore Malcolm (1058-93) spent his boyhood in Cumbria, his youth at the court of Edward the Confessor of England. He was by race only half a Celt, for his mother was an Anglo-Dane, sister of Earl Sward. The court which helped to form his character was already sub-

ject to Norman influence. The Confessor, like Canmore, had been educated in exile, at the Norman court, and favoured the Normans. Though the course of events led Malcolm to ally himself with the Anglo-Saxon royal house, the Anglo-Saxon and Anglo-Norman periods of Scottish history were not, as in England, separated by several centuries, but were nearly contemporaneous. If Malcolm, Edgar, and the first Alexander may be regarded as Scots-Saxon, David I and his successors were truly Scots-Norman feudal monarchs. Apart from the customs and language of Lothian, which descended from Anglian Northumberland, Scotland received scarcely any pure Saxon institutions. Those it did receive have a mixed Saxon and Norman imprint. There were no tithings, wapentakes, or hundreds, no trial by compurgation, no frankpledge. No witenagemot or folkmotes preceded the great council which became parliament. In short, the system of government we call the Anglo-Saxon constitution never existed in Scotland, although the court of the four southern burghs and the customs of the towns of Lothian copied from those of Newcastle, and a similar association of burghs, the Hanse of Aberdeen, of which there are faint traces in the north, had a Teutonic origin. And some traces of Anglo-Saxon criminal law are to be found in the early Scottish charters.

Canmore ascended the throne (1058) not long before England was subjugated by William the Conqueror. The only recorded event of his reign prior to the Conquest was his quarrel with Tostig, his "sworn" brother, when he made a raid south of the Tweed and violated the peace of St. Outhbert by ravaging Lundisfarne. The early years of his reign were devoted to establishing his rule in the northern districts, where his marriage to Ingeborg, widow of Earl Thorfinn, related by the Norse but not the Scottish writers, may have aided him. Ingeborg, already old, cannot have long survived the union, nor is the fact of the marriage certain. The victory of Hastings brought to the Scottish court as refugees Edgar Atheling, grandson of Edmund Ironside, and his three sisters. Their father, Edward, had found shelter in Hungary in the reign of Canute and married an Hungarian princess. The eldest daughter of the marriage, Margaret, became the wife (1068) of Malcolm Canmore. Her virtues more than his wars make his reign an epoch of Scottish history. This alliance and the advance of the Conqueror on Northumberland in the third year of his reign rendered a collision inevitable. Malcolm twice harried Northumberland during the reign of the Conqueror with the view of restoring the Atheling. In the interval between these expeditions William retahated by invading Scotland as far as Abernethy, where he forced Malcolm to do homage. After the second he sent his son Robert, who reached Falkirk, but he returned without having accomplished anything, except that he built Newcastle as a frontier fortress. In this reign Northumberland itself was never really subdued, and William laid waste the district between the Humber and the Tees as a barrier against the northern Angles and Danes. After the Conqueror's death Malcolm prepared for war, but peace was made before he had left Lothian, and he again took an oath of homage. Next year William Rufus succeeded in reducing Cumbria south of the Solway, then held by Dolphyn, lord of Carlisle, a vassal of Malcolm, rebuilt the castle of Carlisle, and made the adjoining country for the first time English. He then summoned Malcolm to Gloucester, but the meeting ended, like others when a summons to do homage at a distance from the border was sent to the kings of Scotland, in settling both in a more hostile attitude. Malcolm on his return raised his whole forces for the last expedition of his life, in which he was slain (1093) in an ambushade

near Alnwick by Mael of Bamfborough. He left to his 1058-1097 successor a kingdom bounded on the south by the Tweed, the Cheviots, and the Solway, though there was much debatable land along the borders, and the English king claimed Lothian as successor of the Northumbrian Angles, while the Scotch claimed English Cumbria as a dependency dating from the grant of Eadgar. Malcolm's defeat of the mother of Maelisnechtan, son of Luiaich and moirna of Moray, is the only event recorded to indicate that his relations with the Celtic population were not peaceful, but the materials are too scanty to make it clear how far the northern chiefs asserted their independence. The foundation of Mottlach by Malcolm is proof that the Aberdeen lowlands at least were within his dominion.

The brightest side of Malcolm's reign was the reform Margaret due to Margaret. Her life by Theodorici, a monk of Durham, or her confessor, Turgot, though coloured by partiality for a good woman, the patron of the church, bears the marks of a true portrait. The miraculous element in the lives of the Celtic saints, diminished but still present in Bede, disappears. The chief changes in the Celtic Church effected by Margaret with the aid of monks sent by Lanfranc from Canterbury were the observance of Lent, the reception of the Eucharist at Easter, which had fallen into neglect, the use of the proper ritual in the mass, the prohibition of labour on the Lord's day, and of marriage between persons related by affinity. She restored Iona, long desecrated, founded the church of Dunfermline in commemoration of her marriage, and protected the hermits, still common in the Scottish Church. Her severe fasts and her liberality to the sick and aged are especially noted. She washed the feet of the poor and fed children with food she had prepared, procured freedom for captives, and on either side of the ferry called Queensferry after her she erected hostels for pilgrims. Nor did her piety lead her to neglect domestic duties. The rude manners of the Celtic court were refined by her example. The education of her children, her chief care in her husband's frequent absence, was rewarded by the noble character of the saintly David and the good Queen Maude. She did not long survive her husband, hearing of his death she thanked the Almighty for enabling her to bear such sorrow, to cleanse her from sin, and after receiving the sacrament died praying. The chapel on the castle rock at Edinburgh, erected in her memory, is the oldest building now existing in Scotland, with the exception of the meagre ruins of the Celtic Church in the western Highlands.

After Malcolm's death there was a fierce contest for the crown (1093-97), which showed that the union of Celtic and Saxon blood was not yet complete in the royal house, much less in the nation. Before the corpse of Margaret could be removed to Dunfermline for burial, Donald Bann, Donald brother of Malcolm Canmore, besieged the castle, and his removal was only accomplished under cover of mist. Donald, who had the support of the Celts and the custom of tanistry in favour of his claim, was king nominally at least six months, when he was expelled by Duncan, son of Malcolm and Ingeborg, assisted by an English force, in which there were Normans as well as Saxons, but his tenure was equally short, and Donald, aided by Edmund, the only degenerate son of Malcolm and Margaret, who slew his half-brother Duncan, again reigned three years. This was the last attempt of the Celts—though partial risings continued frequent—to maintain a king of their race and a kingdom governed according to their customs. Edgar Atheling, who had become reconciled to the Norman king, led an army into Scotland and by a hard-fought battle dispossessed Donald and restored his eldest nephew, Edgar, to his father's throne.

The reign of Edgar (1097-1107) was unimportant. Its Edgar.

1007-1127

chief event was the cession of the Sudreyar or islands on the west coast to the Norse king Magnus Barefoot, who also conquered Man and Anglesæ. The terms of the treaty which, after two expeditions, he extorted from Edgar were that every island was to be his between which and the mainland a helm-bearing ship could pass, and by carrying one across the mainland he included Cantyre. Magnus was killed in Ulster, but the Hebrides remained in the hands of the Norse kings or lords, and acknowledged their sway till the battle of Largs (1263). Their cession was the necessary price for the consolidation of the Scottish monarchy in the south of the kingdom. Edinburgh was the capital of Edgar, a circumstance which marked the removal of the centre of the kingdom to its southern and Saxon district. His standard had been blessed at Durham when he recovered the crown, and it was to Durham or Dunfermline, where he was buried, that his benefactions were made. Iona had passed into the hands of Magnus, but he, being a Christian, respected its sanctity. Scone was henceforth only the scene of the coronation ceremony.

Alexander I.

Edgar, dying childless, was succeeded by his brother Alexander I. (1107-24). Educated by his mother, and after her death in England, Alexander, like his brothers, brought to the government of Scotland Saxon combined with Norman culture. The singular will by which Edgar left Cumbria to his younger brother David was not to Alexander's taste, but the support which the Saxon population and the Norman barons, now beginning to hold land in that district, gave to David forced his brother to acquiesce in the division of the kingdom. It was now restricted to Lothian, Merse, and the country beyond the firths, as far as Mar and Buchan. His hold of Moray and Ross, Sutherland and Caithness, must have been rather as suzerain than as sovereign, the mainland of Argyll was now or soon after in the possession of Somerled, ancestor of the lords of the Isles, the northern isles (Nordreyar) as well as the Sudreyar remained Norse. The chief towns of Alexander were Edinburgh, Stirling, Inverkeithing, Perth, and Aberdeen. At Scone he founded a monastery for canons of St Augustine, but St Andrews was still the sole Scottish bishopric. Alexander married Sibylla, a natural daughter of Henry I. of England, and secured peace with that country. His only recorded war was with the men of Mearns and Moray, who surprised him at Invergowie. He pursued them to the Moray Firth, where a signal victory (1114) gained for him the epithet of "The Fierce." The change from the Celtic to the Roman form of church government commenced by his mother and his brother Edgar was continued. Anselm congratulated him on his accession, and asked protection for monks sent to Scotland at Edgar's request. On the death of Fothad, the last Celtic bishop of St Andrews, Alexander procured the election of Turgot, his mother's confessor and prior of Durham. His consecration was delayed through a dispute between Canterbury and York, and, having failed to effect the anticipated reforms, he went back to Durham. On his death Eadmer, a monk of Canterbury and chronicler of note, was selected for the office by Ralph, archbishop of Canterbury. The choice was confirmed by the clergy and people, but a quarrel with Alexander as to his investiture led to his return to Canterbury. Robert, prior of Scone, became bishop in the year of Alexander's death, but his consecration also had to be put off. These disputes as to the consecration and investiture of the bishop of St Andrews turned on the rival claims of Canterbury and York to be the metropolitan of Scotland, and the refusal of Alexander to cede the independence of the Scottish Church, though anxious for an English monk to organize the diocese. National feeling was already strong in Scotland, even in a king with English sympathies.

Without the aid of Turgot or Eadmer, Alexander himself laid the foundation of diocesan episcopacy. The first bishops of Dunkeld and Moray date from his reign, and the first parish on record, Ednam in Roxburghshire. At Inchcolm, as well as Scone, he introduced the canons regular of Augustine, and on an island of Loch Tay a cell from Scone was built in memory of his wife Sibylla. He restored the "Boar's Chase" to St Andrews and increased the endowments of Dunfermline. The offices of chancellor, constable, and sheriff also now appear, and the mormaers of the Celtic districts are designed as earls (*comites*) in one of his charters. The transition from the Celtic to the feudal monarchy had begun. Alexander was a learned monarch, like his father-in-law Henry Beaulak, pious and friendly to the church, but severe to his subjects.

David I. (1124-53), the youngest son of Malcolm and David I. Margaret, became king at the ripe age of forty-four. He had been trained at the court of Henry I. and his sister Matilda, so that "his manners were polished from the rust of Scottish barbarity." After Edgar's death he served an apprenticeship for the royal office as earl or prince of Cumbria, where his power was little short of regal. He married a Saxon, the daughter of Waltheof, earl of Northumberland, widow of Simon de St Liz, Norman earl of Northampton, and his friends and followers were chiefly Norman. His marriage brought him the earldom of Huntingdon, and he was guardian of the earldom of Northampton during his stepson's minority, so that he entered into feudal relations with the Norman king of England. In the government of his principality he succeeded in reducing a wild part of Scotland into order, using for this purpose the agency of the church.

The history of the church in Strathclyde since Kentigern's death is obscure. The records of York claim the consecration of a bishop of Glasgow in the middle of the 11th and another at the commencement of the 12th century; but they are unknown in the records of Glasgow, and were perhaps invented to support the metropolitan claim of York over that see. Glasgow certainly was restored after some considerable lapse in the person of John, the tutor of David, who at his request was consecrated by Pope Paschal II. This was a parallel step to the summons of Turgot and Eadmer to St Andrews, but David, like Alexander, maintained the independence of his own bishopric, and, though pope after pope sent letters and legates exhorting obedience to York, neither John nor his successors yielded it. A new see erected at Carlisle by Henry I. and the restoration of Whithorn by Henry II., both subject to York, were counter measures on the part of the English sovereigns. The independence of the Scottish from the English Church (with the exception of Galloway and some places of Lothian still under Durham) thus asserted by the rulers of Scotland was of great moment in its subsequent history, and was promoted by the liberality of David and his brothers. The request by David's order by which the land of the see of Glasgow was made may refer to ancient possession, but it had the effect of a new grant. Its extent—covering lands in the dales of the Clyde, Tweed, Tyviot, Annan, Nith, and in Ayrshire—corresponds to the district of Cumbria under David and, with slight deviations, to the future diocese of Glasgow. While David's province did not include all of ancient Cumbria, it did include some parts of ancient Lothian, the future shires of Berwick, Roxburgh, and Selkirk. The Cumbrian nobles were a mixed class,—some Saxon and others Norman. There were few of pure Celtic blood.

Three years after his accession David was present at the David council of London, where, along with the English barons, he swore to accept his niece Matilda as the successor of

Henry I, who had lost his only son by the shipwreck of the "White Ship." Soon after a rising of Scottish Celts under a natural son of Alexander and Angus, a grandson of the mormaer of Moray, was defeated at Stracathro (Forfar) by David's troops in his absence in England, and four years later another under Wmuid, who pretended to be Malcolm MacHeth, a chief in Ross, aided by Somerled of Argyll, who had acquired some of the adjacent isles, was put down by Wmuid's capture. The death of Henry I and the claim of Stephen to the English throne led to the invasion of England by David, in support of Matilda, with an army drawn from all parts of his kingdom, — the men of Galloway, Cumbria, Teviotdale, Lothian, Lennox, the Isles, Scotia (the country south of the Forth or Scots Water), and Moray. Their defeat at the battle of the Standard at Cuten Moor (1138) near Northallerton by the barons of northern England was due to the want of discipline of the men of Galloway, and, though signal, was not decisive. At Carlisle peace was made on condition that David's son Henry should hold Northumberland as an earldom under Stephen, with the exception of the castles of Bamborough and Newcastle. David gave hostages, but retained Carlisle and Cumberland without any condition of homage. Two years later, when Matilda seized London, David joined her, but she was unable to maintain her advantage. David was forced to return to Scotland, and did not again engage in active hostilities against Stephen. His death was preceded by that of his only son, but his power was so firm that he procured the acknowledgment of his grandson Malcolm, a boy of twelve, as successor to the Scottish crown, while William, his younger grandson, succeeded to Northumberland and the English fiefs his father had held.

Diocesan
and
feudal
organiza-
tion of
kingdom

The compatiative peace of his last twelve years gave David opportunity for the ecclesiastical and civil organization of the kingdom. He found three and left nine bishops, adding to St Andrews, Moray, and Dunkeld the new sees of Glasgow, Brechin, Dunblane, Aberdeen (transferred from Mortlach), Ross, and Cathness. Closely connected with their establishment was the suppression of the Celtic Culdees at Dunkeld, St Andrews, and Loch Leven, and perhaps also at Dunblane and Dornoch, where canons regular of St Augustine became the chapters of the bishop. The abbey, chiefly Cistercian, which he founded were Holyrood, Newbattle, Melrose, Jedburgh, Kelso, Cambuskenneth, Urquhart, and Kinloss. He added to the endowments of his father and mother at Dunfermline, and so lessened the crown lands that James I. called him "a sore saint for the crown." The division into dioceses stimulated the formation of parishes endowed by the bishops or by the lords of the manor, but the first steps of the parochial division of Scotland are obscure. The diocesan episcopate now included the whole of Scotland except what was held by the Norsemen, who had bishops of their own for the Orkneys and the western isles, subject to the metropolitan of Drontherm. It preceded the civil division into sheriffdoms, which also began in this reign, but took a longer period to complete. The Celtic chiefs in the north and in Galloway were as yet too powerful to allow royal officers to hold courts within their territory, and regalities with the full rights of the crown in matters of justice were more lavishly granted in Scotland than in England, where they were confined to the few palatine earls or bishops on the border. The feudal system in Scotland, erroneously antedated to the reign of Malcolm II or Malcolm Canmore, really took root in that of David. The king administered justice in person. The great judicial officer of state, the justiciar, who went circuits in the king's name, appears either in this or the preceding reign, so also do the seneschal or steward of the royal household

and the chamberlain who collected the royal revenues. The tenure of land by charter, of which there are a few examples by Edgar in favour of Durham and by Alexander I in favour of Scone, now became common. The charters of David to the abbey of Holyrood, to Robert Bruce of Annandale, and others are in the regular style of the Norman chancery. There are also instances of subordinate grants by subjects, which the king confirms. Though no charter to a burgh is extant, David refers to Edinburgh, Perth, and Stirling as his burghs. The inquest in favour of the see of Glasgow is, by the verdict of those best acquainted with the facts, similar to the Norman inquest. The laws of the four burghs of Lothian—Berwick, Roxburgh, Edinburgh, and Stirling—are records of customs existing in this reign, while a variety of other laws called assizes, chiefly relating to tolls and matters of criminal jurisprudence, were the legislative acts of the king, assisted by the council of his great nobles. The beginning of the feudal system in Scotland was invigorated by the personal character of David. The absence of any large body of settled Celtic or Saxon customs gave full play to its assimilative influence. In the reigns which followed Scotland became a purer example of a feudal state than England, where a large number of Teutonic customs contributed to form the common law. A few of these found their way into Scotland, chiefly through the burghs or the medium of Norman charters, in which they had been incorporated. But the Scottish common law was in the main derived from the Roman code through the canon law, and not from Anglo-Saxon customs. Though never canonized by the church, this great monarch, for his faithful administration of justice and the purity of his domestic life, was deemed a saint by the people.

David's grandson and successor Malcolm IV (1154-65), Malcolm called "The Maiden," died too young to leave a permanent impression. A rising by Somerled, lord of the Isles, and the sons of Malcolm MacHeth, mormaer of Moray, was suppressed in the early years of his reign, and peace was made with Somerled in 1158. A treaty by which Malcolm surrendered Northumberland and Cumberland to Henry II, and his following that king (who knighted him at Tours) in an expedition to Toulouse, led to the revolt of the earl of Strathern with five other chiefs. This brought him suddenly home. An attempt to take him by surprise at Perth failed, and next year he succeeded in reducing Moray and Galloway, whose earl, Fergus, had also taken advantage of his absence. Moray was occupied by foreign settlers (1160), amongst whom, besides Norman barons, were Flemings,—a race fitted to civilize a new country by their industry. It is to this settlement that the permanent subjection of Moray to the Scottish kings, and perhaps the peculiar dialect and character of the inhabitants of that part of Scotland, were due. Four years later Somerled again attacked the west coast, but was defeated and slain at Bentreu, when the isles south of Ardnamurchan, which he had won from Godred the Black, son of Olaf, king of Man, were divided amongst his sons Dugall, Regnald, and Angus. Next year (1165) the young king himself died at Jedburgh. While he was reproached for yielding too much to the powerful English monarch, his service abroad enabled him to obtain the necessary experience to contend with the Celtic chiefs. The reduction of Galloway and Moray more than compensated for the loss of the earldoms in northern England, the possession of which by the Scottish king must have been precarious. Before his death Bute had been taken by the steward of Scotland,—the first footing the Scotch got on the larger isles, but it was afterwards recovered by the Norwegian king Haaco and restored to Ruari, a descendant of Regnald.

Malcolm, dying childless—though he had an illegitimate

1165-1215 son who predeceased him—was succeeded by his brother William the Lion (1165-1214). His reign, the longest of any Scottish monarch, though not so uniformly successful as that of his grandfather, was an important era in Scottish history. It is divided into nearly equal portions by the accession of Richard Cœur de Lion. The first consists of the war with Henry II., in which William was captured (1175), and this made him the subject of the English king for fourteen years. In the second he recovered his independence, and, resuming the task of his predecessor, consolidated the Scottish kingdom in the north and west. William commenced his reign by taking part in the war with France as vassal of Henry II. for the fief of Huntingdon, but, being disappointed of the promised restoration of the northern earldoms, he entered into negotiations with Louis VII. of France. This memorable event is the first authentic connexion between Scotland and France, and was afterwards antedated by a fiction to the time of Charlemagne. Dictated by the situation of the two countries, equally exposed to danger from the power of England under the Angevin or Plantagenet kings, the alliance between France and Scotland continued with few breaks until the close of the 16th century, and even in the 17th and 18th was relied upon by the last of the Stuarts. France proved a broken reed to the Scottish kings, but the intercourse between the two countries brought the Scottish people, when war with England after the close of the 14th century shut them out from the advancing civilization of that country, into contact with the chivalrous manners of the court and the learning of the schools of France during the best period of French history. Nothing came of the alliance at this time, and two years later William and his brother David, in whose favour he resigned the earldom of Huntingdon, attended the coronation (during his father's life) of the younger Henry at Windsor. That ill-judged step and the murder of Becket led to a domestic revolution, and William, tempted by the promise of the earldom of Northumberland, joined the young king against his father (1173). He failed in the sieges of Wark and Carlisle, and next year was taken prisoner at Alnwick by Ranulph de Glanville and sent by Henry's order to Falaise in Normandy. To procure his release he made a treaty with Henry by which he became his vassal for Scotland and all his other territories. The Scottish Church then for the first and last time owned subjection to that of England. This treaty settles the disputed question of the Scottish homage. It was only by conquest and the captivity of its king that such terms could be obtained. To secure the observance of the treaty the four burghs of Scotland were to be placed in Henry's hands and hostages given till their delivery. The ambiguous terms of the clause as to the church enabled the Scottish bishops to refuse obedience to the see of York, and, Canterbury having advanced a rival claim, Henry, not displeased to see ecclesiastical quarrel, allowed the Scottish bishops to leave the council of Norham without acknowledging it. The foundation of the abbey of Abbotbroich in memory of Becket, whom he had known at Henry's court, was almost the only endowment of William. At home he put down revolts in Galloway, Ross, and Caithness. A long dispute with successive popes as to the see of St Andrews afforded a signal example of the perseverance of William. He also procured a distinct acknowledgment of the independence of the Scottish Church and its immediate subjection to Rome alone, which Henry II., now approaching the calamitous end of his reign, could not prevent, nor was he able to enforce payment of the Saladin tax from the Scottish bishops. Immediately after Henry's death Richard Cœur de Lion, moved by the necessity of money for the crusades, consented for a payment of 10,000 marks to the abrogation of the treaty of Falaise (1189) as having been extorted

from William when a captive, and restored Scotland's ancient marches.

The second part of William's reign was occupied with internal affairs. Richard's absence and John's disputes with the pope and his own barons gave a relief from English war. The raising of the ransom tried the resources of Scotland, and was met by an aid from the clergy and barons. Rivals of Harold, earl of Caithness, and his son Torphin (1197), and another by Guthred (1211), a descendant of the mormaer of Ross, were quelled. The birth of a son strengthened William's throne. He at one time contemplated an invasion of England, for which John's weakness afforded a good opportunity, but desisted, it is said, in consequence of a vision, perhaps remembering his own age and that of his heir. The proposed erection by John of a castle at Tweedmouth to overawe Berwick led to a rupture, but, after protracted negotiations and threats, a treaty was made (1209) by which William agreed to pay 15,000 marks. John was to procure suitable matches for his two daughters, and Tweedmouth was not to be rebuilt. The barons promised at a council in the following year to raise 10,000 and the burghs 6000 marks. This is the first mention of a contribution by the burghs to a feudal aid. William was their great benefactor, as Henry the Fowler in Germany and Richard in England, many of their charters date from his reign. Legislation contained in the form of assizes, which required the sanction of a great council. As in England, the necessity of raising money first gave rise to municipal rights and to facilities for some discussion of public affairs in what afterwards grew to be the parliament. This assembly was still the *curia regis* of the vassals of the king, and the Scottish parliament never lost marks of its origin. William died at Stirling in 1214 in the seventy-second year of his age. The lion rampant, which he took for his seal, became his epithet, and represents his chivalrous and determined character. He set the example, which his son and grandson followed, of cultivating friendly relations with the English sovereign, and his efforts to maintain the independence of Scotland were rewarded by internal peace. It was only in the outlying districts that risings had now to be feared. The number of shires where the king's sheriff, frequently (by a policy wise at the time, but afterwards dangerous) the chief baron of the district, administered justice at the head towns increases, and this, as well as the growth of trade, brought into prominence the burghs, each with a royal castle where the king in his frequent progresses held his court, and if needful summoned the great council of his realm. The chief burghs whose charters date from this reign are Perth, Aberdeen, Inverness, Dumfries, Lanark, Irvine, Ayr, Forfar, Dundee, Arbroath, Montrose, Inverurie, Kintore, Banff, Cullen, and Nairn. Their number and sites, spread over the whole country, mark a settled policy and the progress of the kingdom in the arts of peace. A new diocese—Argyll—was founded by separation from Dunkeld, to which John the Scot, then bishop, sent his chaplain as knowing Gaelic, and, though the Hebrides were still Norse, this was a step towards the complete organization of the church and to the extension of the kingdom which followed in the next two reigns, when the Isles also were added (1266) to Scotland.

Alexander II. (1214-49), son of William, was crowned at Scone in his seventeenth year, in time to take part in the great struggle in England for Magna Charta, which had reached its crisis. He sided with the English barons, who made an agreement by which Carlisle and the county of Northumberland were to be given to Alexander. In fulfilment of his part he besieged Norham, while the barons inserted in Magna Charta a clause by which John

promised to render to Alexander what was his right with reference to the marriage of his sisters and his kingdom, unless the charters of his father William authorized otherwise, and this was to be decided by the judgment of his peers in the *cuna regis*. The position of the Scottish king as one of the English barons in whose favour Magna Charta was granted is pregnant evidence of the fact that he was not, like John, Henry III., and Edward I., a monarch with imperial tendencies, the adversary of the rights of the barons and the people. The Scottish kings in this century and Bruce in the next were popular sovereigns, and their memory supported the crown when it was won by less worthy successors. Next year John broke the charter, reduced by the aid of mercenaries the northern counties of England, and, advancing into Scotland, stormed Berwick and burnt Roxburgh, Haddington, and Dunbar. On his return he pillaged Coldingham and set fire to Berwick. Alexander retaliated by wasting England as far as Carlisle, which town, but not the castle, he took in the autumn, then, marching to Dover, he did homage to Louis, the son of Philip Augustus, whom the English barons had chosen as king. Next year (1217) he again invaded England, but made peace with Henry III., which was confirmed three years later at York. Alexander agreed to restore Carlisle, do homage for his English fiefs, and obtain release from the excommunication which the pope had declared against the barons and their allies. Henry promised to give Alexander one of his sisters in marriage and to procure suitable husbands for the Scottish princesses. Accordingly, Alexander married Joan, the elder daughter of John, while Margaret, his sister, became the wife of Hubert de Burgh, earl of Kent, and Isabella of Roger Bigod, earl of Norfolk, both nobles who took a prominent part in the Barons War. These alliances rendered the peace with England more secure, and allowed Alexander to devote himself to the reduction of the periodical insurrections of the Celtic and Norse chiefs on his northern and western borders. He reduced Argyll (1222), which he created a sheriffdom, and forced John, earl of Cathness, to surrender part of his lands and pay compensation for his share in the burning of Adam, its bishop. The wisdom of his settlement of Argyll was proved by the inhabitants repelling an attack by Haco, the Norse king. He was equally successful in quelling the risings of two chiefs of the same name, Gillescop, one in the west, the other in Moray. Five years later (1230) a disputed succession in Galloway gave him the opportunity of chastising that turbulent province and dividing it among three co-heresses. The fall of Hubert de Burgh and the succession of Peter des Roches to the chief place in the council of Henry III. changed the attitude of that king towards Scotland, but Otto, the papal legate, preserved peace by a compromise of the rival claims. A little more than a year after the death of his wife Joan without issue, Alexander married Mary de Couci, daughter of a French noble house, which counted itself the equal of kings, and Alexander III., the child of the marriage, was betrothed when an infant of a year old to Margaret, daughter of Henry III. Two years later (1244) a serious rupture, fomented by Walter Bisset, a Scottish exile, and caused by a projected alliance of Alexander with France and the erection of castles on the border, was averted by the treaty of Newcastle, by which the kings of England and Scotland bound themselves not to make alliances with the enemies of each other. The last year of his life was occupied in putting down a second rising in Galloway, and in preparing for an expedition against Haco, with the view of annexing the Hebrides, but he died of fever at Kerrera, in the Bay of Oban, while mustering his fleet. These expeditions, all successful, are proof of the active

character of the king, who must have been called "Peaceful" because he preserved peace with England, for he was in fact a warlike monarch, enforcing the feudal levy, which, according to Matthew Paris, amounted in his time to 10,000 horse and 100,000 foot, and extending the feudal civil government. Like his predecessors, he was a benefactor of the church, especially of the new mendicant orders, whose monasteries were founded in all the principal towns. The most important of his statutes were the substitution of trial by jury for the ordeals of fire and water, and the regulation of trial by battle, with provision for the case of women and the clergy. He was deemed, like David, a protector of the poor.

Alexander III. (1249-85) was only eight years old when his father died. A succession of contests for the regency^{der III} between a party of nobles who favoured English influence and a national party was the consequence. The former tried to delay the coronation on the pretence that the young prince was not a knight, but Comyn, earl of Menteith, baffled them by the proposal that the bishop of St Andrews should perform both ceremonies. The rehearsal of his descent from the Celtic line of kings was made, according to a custom becoming old-fashioned, for the last time by a Highland sennachy, to please the Gaelic subjects, while the translation of the corpse of St Margaret into a precious shrine at Dunfermline was calculated to have a similar effect in the Lowlands. Henry III. had asked the pope to declare the coronation illegal without his consent, but the pope refused. Foiled in this, Henry celebrated at York the nuptials of his daughter and the young king, whom he asked to render homage for his kingdom. The reply that he had not come to answer such a question and must advise with his counsellors implied that he had counsellors little likely to grant it. About this time Durward the justiciar and Robert the chancellor were dismissed, and the earl of Menteith held the chief power for five years. A secret mission of Simon de Montfort led to the earl of March, Durward, and other nobles seizing the young king and queen, and at a meeting with Henry at Kelso the Comyns and their supporters were removed from office (1255) and other regents appointed. Two years later the bishop of St Andrews got the pope to excommunicate Durward and the English regents. Next year a compromise was effected and a joint regency appointed, consisting of the queen dowager and her husband, the earl of Menteith and Durward, and the supporters of both parties. When Alexander was nearly of age the earl of Menteith died, whereupon the king took the government into his own hands (1261). Henry, engaged in the dispute with his barons, could not interfere. Alexander at once resumed his father's project for the reduction of the Hebrides; but Haco, the Norwegian king, of the forestalled him by invading Scotland, when a storm, which dispersed his fleet, and the loss of the battle of Largs (1263) forced him to retire to the Orkneys, where he died. Magnus Olafson, king of Man, the chief Norse feudatory, a descendant of Godred the Black, submitted to Alexander, and although some of the islands held out they were reduced by the earls of Buchan and Mar and Alan Durward. At last Magnus, the son of Haco, concluded a treaty at Perth (1266), by which he surrendered Man and the Sudreyar for a payment of 4000 marks and an annual rent of 100, the rights of the bishop of Drontheim were reserved. From this time the western isles were subject to Scotland. At the parliament of 1284, which settled the crown on the Maid of Norway, their great nobles, descendants of Somerled, attended as vassals, and the subsequent revolts (of which there were many) were instigated by the English king, who found useful allies in the chiefs of the Isles. In the Barons War Alexander aided his father-in-law, on

266-1292 whose side three Scottish barons, John Comyn, Robert Bruce, and John Balfour, fought at Lewes, where the first two were taken prisoners. In the matter of the independence of his kingdom Alexander was as firm as his predecessors, and would not allow Henry himself or the legate Ottobon to collect within it a tithe for the crusade which the pope had guaranteed to the English king. On the accession of Edward I (1272) Alexander attended his coronation, but neither then nor six years later, when specially summoned to Westminster, would he do homage for Scotland. The closing years of Alexander were saddened by domestic losses. His wife died in 1273, his younger son David in 1281. His only daughter, Margaret, married two years before to Erik of Norway, and his elder son, Alexander, both died in 1283. The following year the estates at Scone recognized the succession of Margaret, the Maid of Norway, but Alexander, in hope of a male heir, married Joleia, daughter of Count de Dieux. At the festivities in Jedburgh in honour of the marriage a ghostly figure in the masque was deemed an omen of the king's death, which followed from a fall near Kinghorn (1285). The prosperity of Scotland in his reign was celebrated in one of the earliest verses preserved in the Scottish dialect—

"Queen Alyxandere our kyng was dede,
That Scotland led in love and le,
Away wes sons of ale and biede,
Of wyne and wax, of gynnyn and gle,
Oure gold wes changed into lede
Cryst, born into vugynite,
Succour Scotland and remede!
That staid in his peple's teine."

Feudal Scotland. Under the wise rule of three kings, extending over more than a century—a circumstance rare in that age—Scotland attained a degree of wellbeing before unknown, which did not return till the 18th century. The extent of the revenue is attested by the returns of the sheriffs to the chamberlain and by the accounts of the tax which Bosmund de Vic, the pope's representative, levied from the clergy for the crusade. Berwick, the chief Scottish port, was likened to Alexandria, and attained an importance it never recovered after its union with England. Its customs were reckoned as equal to a third of those of all England,—a statement hardly credible till we remember that the trade of Britain was chiefly with France and Flanders, and that a harbour for small craft was sufficient. The personal character and bravery of these kings subdued the turbulence of the outlying districts and kept in check the ambition of the nobles. The bounds of the kingdom were almost as they now are, and the name of Scotland permanently passed to the whole country south as well as north of the Forth. In spite of differences of race, the unity of the nation had been secured, and its independence was acknowledged by the pope and other sovereigns, the English alone kept up a nominal claim to rights which had for short periods been held by Canute and the Conqueror, and for longer by the second Henry, until they were abandoned by the treaty of Canterbury. But now all was to be changed. Three centuries of war, though diminishing in intensity as time went on, display heroic character, but imply an amount of suffering to the people which cannot be told. Perhaps a contest between the two proud nations which shared Britain was inevitable, yet the reigns of the Alexanders suggest a different possibility. That the contest came when it did was due to the disputed succession on the death of Margaret, the Maid of Norway. This gave to the ambition of Edward I an opportunity to reduce the whole island to his sway, which he was quick to seize.

Maid of Norway. 5. *War of Independence, from Death of Alexander III. to Accession of House of Stuart.*—The Maid of Norway, whose right was at once acknowledged (for Scotland, like England, knew no Salic law), was not to wear the crown.

A regency administered the kingdom for five years after Alexander's death. A conference at Salisbury between commissioners of Erik of Norway, Edward I, three of the regents, and Bruce, lord of Annandale, agreed that Margaret should be sent home untried. Her marriage to Ed. Treaty ward's son, for which a dispensation had been got from Rome, was sanctioned by an assembly at Brigham near Roxburgh (18th July 1290), in a treaty which made anxious provision for the independence of Scotland. This country was to remain free, and, saving the right of the king of England in the marches or elsewhere, separate from England by its lawful bounds. No parliament was to sit, and no Scottish suit to be tried, out of Scotland. Edward confirmed this treaty by oath, but the death of Margaret in the Orkneys rendered it abortive. To prevent an armed contest for the crown, Fraser, bishop of St Andrews, invited Edward to intervene, and certain Scottish nobles made a similar request. He accordingly summoned the Scottish estates to meet him on 10th May, and the English parliament on 3d June 1291, at Norham near Berwick. When the Scots came Edward refused to judge the cause of the Scottish succession unless his title as superior of Scotland was admitted. After some delay the barons and clergy gave the admission, as also did the claimants—no fewer than thirteen—but the representatives of the commons withheld any such acknowledgment. The court for the decision of the cause was then appointed. Forty members were named by Balfour and as many by Bruce, between whom the competition really lay, while Edward chose twenty-four. On the following day the competitors agreed that saine of the kingdom should be given to Edward, a week later the regent surrendered the kingdom of Scotland and the keeps the chief castles into his hands as lord paramount. He restored possession after adding several Englishmen to the regency. After another adjournment the competitors put in their claims. Three descendants of David, earl of Huntingdon, brother of William the Lion—all English barons, though one, Bruce, had large estates in Scotland—were alone serious. John Balfour claimed as grandson of David's eldest daughter Margaret, wife of Alan, lord of Galloway, Robert Bruce as son of David's second daughter, wife of the lord of Annandale, while David de Hastings, grandson of the third daughter Ada, contended that the kingdom was patible. This last question was postponed until the claims of Balfour and Bruce had been considered. After two long adjournments it was at last decided (14th October 1292) that the case was to be ruled by the law of the kingdom applicable to titles of earldoms, baronies, and other indivisible inheritances, and "that by this law in every heritable succession the more remote by one degree descended from the eldest sister was preferable to the nearer in degree from the second." Edward accordingly decided (17th November 1292) in favour of Balfour. Two days afterwards the regents were ordered to give saine to Balfour, the day following he swore fealty to Edward at Norham; ten days after he was crowned at Scone, within a month he did homage to Edward at Newcastle.

The judgment was just, according to the principles of feudal law afterwards fixed, though then imperfectly established, in favour of primogeniture; the acknowledgment of the suzerainty of Edward was a different matter. In the course of the proceedings Edward obtained from the cathedrals and religious houses of England returns of homage by Scottish kings. No such returns were asked from Scotland. Those from England recited the well-known cases of isolated conquest followed by homage to Saxon, Danish, and Norman kings, Edward the Elder and Athelstan, Canute and the two Williams, and the treaty of Falaise by which William the Lion surrendered the

independence of Scotland. They ignored the treaty of Canterbury by which it was restored, the clause of Magna Charta relating to Scotland and the rights of its king, the refusal of the last two Alexanders to render homage for their kingdom, and the treaty of Brightham by which Edward had acknowledged the independence of Scotland. One result of the submission to the English king overlooked by the eager competitors, but not by the lawyers who advised Edward, immediately emerged. An appeal was soon taken from the court of Bahlol to the court of his superior at Westminster. Bahlol referred in vain to the express clause in the treaty of Brightham that no Scottish suit was to be tried beyond Scotland, Edward replied this was an appeal from his own officers during the interregnum, but asserted his right to hear appeals in all cases. Other appeals followed, and Bahlol weakly surrendered his claim to independent jurisdiction. Shortly afterwards (October 1293) he was himself summoned to Westminster as defendant in a suit by Macduff, son of the earl of Fife. Declining to appear, he was condemned for contempt, and three of his principal castles were ordered to be seized. He again yielded and promised to attend next parliament. There could be no longer doubt what had been the effect of submitting the dispute as to the crown to Edward. Instances of homage had not been difficult to find, but the records might be ransacked in vain for an example of what would now become frequent,—the adjudication by the court of the English king on the rights of Scotsmen. The execution of this decision by force in Scotland earned with it at no distant date the subjection of the kingdom. Bahlol quitted Westminster suddenly in 1294 to escape service in the Gascony war. By yielding in the question of appeal he had lost the confidence of the Scottish barons. In the parliament of Soone a council was appointed to control him, and all feids held by Englishmen were forfeited. In the following year he formed an alliance against England with the French king, and his son was promised the daughter of that king's nephew, the count of Anjou, in marriage. The Scottish army headed by six earls then invaded England, but was repulsed at Carlisle (28th March 1296), and Edward, leaving his French campaign, at once marched northwards. Before the end of March 1296 he stormed Berwick. While there the abbot of Arbroath brought him a renunciation of Bahlol's homage. Dunbar was taken soon afterwards by the earl of Surrey, Roxburgh, Jedburgh, and Edinburgh fell before the end of June, Stirling, Perth, and Soone surrendered without a blow. At this time no Scottish town was walled and no resistance could be made against the English feudal levy led by such a general as Edward. In the churchyard of Stracathro in Forfar Bahlol renounced his alliance with France, and a few days afterwards (10th July) surrendered Scotland to Anthony Beck, bishop of Durham. Edward marched as far as Elgin, but it was a conquest of Bahlol, not of Scotland. This impotent monarch was carried captive with his son to London and vanishes from Scottish history. He died at one of his French feids twenty years afterwards, never having attempted to regain the kingdom. On his homeward march Edward took and recorded in the Ragman Rolls the homage of the Scottish nobility, and carried to Westminster the sacred stone of Soone, on which the Celtic monarchs had been crowned, and the black rock of Margaret, the hallowed relic of the Saxon line. Surrey was appointed guardian, Sir Hugh Cressingham treasurer, and William Ormsby justiciar of Scotland, the nobles were treated with lenity and the bishops bribed by the privilege of bequeathing their moveables like their English brethren. The most important result of the campaign was the capture and fortification of Berwick. That city, the key to the Lothians, was the commercial capital,

and Scotland was left without one until the rise, after the 1292-1298 union, of Glasgow and the mercantile centres of the Clyde.

When the fortunes of Scotland were at the lowest, when the country was deserted by the king, and its nobles and clergy were making terms with the conqueror, Wallace, the man of the people, appeared. The second son of Sir Malcolm Wallace of Elderslie near Paisley, his name indicates a remote Celtic origin from a Welsh or Cambrian stock. In the spring of 1297, in revenge for the murder of his wife, Wallace slew Hazelrig, sheriff of Ayr, and burned Lenark. Collecting a band of followers animated with like patriotism, and aided by a single noble, Sir William Douglas, he surprised and drove Ormsby, the justiciar, from Soone and Beck, the bishop of Durham, from Glasgow. Some of the barons, headed by James the Steward, joined him, and Wallace and Douglas carried everything before them in Lennox and Galloway,—districts more favourable to the national cause than Lothian. The nobles fell away from Wallace almost as soon as Percy appeared at the head of an English force, and Douglas, the Steward, Bruce the future king, and others capitulated at Irvine (9th July 1297). Wallace, while engaged in the siege of the castle of Dundee, heard that Surrey and Cressingham were advancing on Stirling, and he marched to its relief. There at the bridge over the Forth near Cambuskenneth he won his most famous victory (11th September). The English were totally routed and Cressingham was killed. The disparity of numbers was great, for the English had 50,000 foot and 1000 horse, against at most 40,000 foot and only 180 horse. The generalship of Wallace, who tempted his adversary to cross the bridge in his face and held his troops in hand until the moment of the charge, won the day, the first in which a feudal army was beaten by light-armed peasants. Wallace attempted to organize the kingdom he had won. He assumed the title of guardian of the realm in name of the Lord John (Bahlol), and associated with himself Sir Andrew Moray of Bothwell, son of the only baron who stood by him and who fell in the battle. He held the nobles in awe, while he rewarded his adherents. The grant (fortunately preserved) of the office of constable of Dundee to Alexander Scrymgeour can scarcely have been a solitary one. He introduced better discipline in the army, and tried also to revive trade.¹ Shortly after the battle of Stirling Wallace carried the war as far as Hexham, whose monks he protected. That he penetrated farther south and won the favour of Eleanor, Edward's wife, is one of the romantic additions to his scanty history in the poem of Blind Harry. Edward recognized the crisis and, leaving Flanders, sent a force before him under Pembroke, following in person at the head of 80,000 foot and 10,000 horse. For a brief space success attended Wallace, who defeated the English in Fife and Ayr; but the bishop of Durham retook the castle of Dirlleton, and Edward himself, by the victory of Falkirk (22d July 1298), in which the nobles again proved false to the popular cause, reversed that of Stirling. Wallace took refuge in France, and, although the French king at Amiens offered to surrender him, he was soon released and provided with a safe conduct to the pope. Papers found on him when captured show that he received similar letters from Hacon of Norway and Bahlol. Whether he went to Rome is not certain, but he may have been one of the Scots who at this time induced Boniface VIII. to claim the superiority of Scotland. The claim was indignantly repelled by the English barons at the parliament of Lincoln, Edward, however, thought it prudent to lay before the pope a statement in which he advanced not only

Wallace's
struggle
for inde-
pendence

¹ A letter from him and Moray to the citizens of Lübeck and Hamburg who sympathized with the Scottish commons has been found in the archives of Hamburg.

1268-1328 the instances of homage collected for use at Norham but the fall of Brute the Trojan, from whose eldest son Locrinus he claimed descent, and therefore superiority over the Scottish kings sprung from Albanactus the second as well as those of Wales descended from Camber the third Balred de Bisset, the Scottish commissioner at Rome, in his answer admitted the pope's right, but replied to Edward's fiction by another as bold,—the descent of the Scots from Scota, the daughter of Pharaoh. A more solid argument was founded on the treaty of Drigham. The pope delayed judgment, and in 1303 suddenly changed sides and exhorted the Scots, by several bulls, to submit. Edward had not waited for this sanction, the period between the battle of Falkirk and the taking of Stirling was a continuous and bloody struggle. In person he laid waste Galloway and took Carlaverock (1300), in 1302, his general Sir John Segrave, having fought a battle of doubtful issue with Comyn and Fraser at Roslin, Edward returned (1303), marched as far as Carthness, and reduced the whole east of Scotland by the capture of Stirling (24th January 1304). Scotland was subdued, yet Wallace lived, and we catch glimpses of him, in the woods of Dunfermline, in the forest of Ettrick, in the neighbourhood of Lanaik. A pice was set on his head, and at last he was betrayed by a servant of Sir John de Menteth near Glasgow and taken to London, where, after a mock trial in Westminster Hall, he received the traitor's doom (23d August 1305), though he denied with truth that he had taken any oath to Edward.

This time Edward, in order to make the conquest of Scotland permanent, proceeded to incorporate it in the empire of England. With apparent fanfance an assembly was summoned to Perth to elect ten representatives to attend a parliament at Westminster to treat of the affairs of Scotland. Nine commissioners came to London, where they were associated with twenty Englishmen. The result was the "Ordinacio facta per domnum regem pro stabilitate terre Scotie" (1305). Though never fully carried out, this document, on the model of similar ordinances for Wales and Ireland, discloses Edward's designs. English nobles were appointed to administer the government of the country, and eight justices to administer the law. The law and usages of Scotland (except those of the Brets and Scots, which were abrogated) were to be observed in the meantime, but the lieutenant (John de Britany, the king's nephew) and council were to amend what was contrary to God and reason, or in case of difficulty refer to Edward at Westminster. The whole country was divided into sheriffdoms, the sheriffs being removable at the discretion of the lieutenant. The office of coroner, more important than then now, was also regulated, certain persons were nominated constables of the chief castles, and many nobles were fined and others banished. Bruce (the competitor's grandson) was ordered to put Kildrumny Castle (Aberdeen) in charge of an officer for whom he should be responsible. The ordinance was suitable to its object,—moderate, even humane. The banishment of the nobles was limited as to time. Relief was given in the payment of fines. Many old officers were continued. Edward's aim at this time was to pacify the country he had conquered, to put down resistance, but to encourage submission. It is as wrong to call him a tyrant as Wallace a rebel. The one was a statesman king with imperialist aims, the other a patriot leader with keen popular sympathies. The king triumphed, but before his death his well-laid plans were shattered. Scotland again rose in arms, and this time the nobles joined the people, under the leadership of Robert the Bruce.

Robert the Bruce.

The position, as well as the character, of Bruce contrasted with that of Wallace. Instead of being a cadet of the ordinary landed gentry, Bruce represented a family in

which for more than two centuries the purest Norman blood had flowed. The English branch of Skelton in Cleveland and the Scottish branch of Annandale divided their large possessions, but those of the latter sufficed to make its head one of the most powerful nobles in Scotland, who still retained, as so many did, English fiefs. More than one of his ancestors had intermarried with the royal house of Scotland (see ROBERT THE BRUCE, vol. xx p. 592). On his father's death Bruce succeeded to Annandale. He held besides several manors in England. During the early part of the War of Independence, like many barons with conflicting interests, he had wavered, sometimes supporting Wallace, more frequently the English king. In 1303-4 he assisted Edward in the preparation for the siege of Stirling. He had been consulted with regard to the ordinance of 1305. But there were already signs of mutual distrust. The provision in the ordinance as to Kildrumny shows that Edward was aware special precautions had to be taken to secure the loyalty of Bruce, and on 11th June 1304 Bruce secretly met near Cambuskeneth Lamberton, bishop of St Andrews, and entered into a bond referring to future dangers from Edward. Of all the Scottish clergy Lamberton had been most friendly to Wallace, and this bond was a link between the two periods of the War of Independence and their leaders. Bruce had attended at Westminster when the ordinance was settled, but left suddenly, arriving at Dumfries on the seventh day. There he met in the church of the Friars Minor John (the Red) Comyn of Badenoch, Balhol's nephew, and slew him before the high altar (10th February 1306). The die was cast, and indecision vanished from the character of Bruce. Collecting his adherents at Lochmaben and Glasgow, he passed to Scone, where he was crowned by the bishop of St Andrews. It at first seemed likely that a saying of his wife would prove true,—that he was a summer but would not be a winter king. His defeat at Methven (19th June 1306) was followed by another at Strathfillan (11th August), and Bruce took refuge in the island of Rathlin (off Antrim, Ireland). The tales of his hairbreadth escapes, his courage and endurance in all changes of fortune, were gathered by Barbour from the mouths of the people, who followed the life of their champion with the keenest interest. Meanwhile Edward came north and gave a foretaste of his vengeance. But his severity strengthened the party of Bruce, which grew daily. All classes now made, with few exceptions, common cause against the enemy of all. Edward's death at Bugh-on-Sands (7th June 1307) at once changed the whole aspect of the invasion. Edward II. wasted in the ceremony of a funeral and the diversions of a youthful court the critical moment of the war. Bruce seized his opportunity, and by the close of 1313 Berwick and Stirling alone remained English. The independence of Scotland was finally determined by the ever-memorable victory of Bannockburn (24th June 1314).

Bruce reigned fifteen years after Bannockburn and (if the Irish expedition of his brother Edward be left out of account) with almost uninterrupted success. On his return from Ireland he reduced Berwick (March 1318) and converted it from an English to a Scottish frontier town. His recognition by the pope was followed by the acknowledgment of Flanders and France, and the long truce which Edward II. had been forced to agree to before his death became in the new reign a formal treaty known as that of Northampton (April 1328). By its leading article "Scotland according to its ancient bounds in the days of Northampton shall remain to Robert, king of Scots, and his heirs, free and divided from England, without any subjection, servitude, claim, or demand whatsoever." In pursuance of another article Johanna, Edward's sister, was married to David, the infant son of Bruce, at Berwick on

12th July As an administrator and legislator he showed an ability not inferior to that which in his earlier years he had manifested as a warrior and a general. He obtained from the estates a settlement of the succession, reformed abuses in the feudal law, regulated the courts, providing equal justice for poor and rich, and framed strict Acts against sedition. He also encouraged trade, especially shipbuilding, foreseeing its future importance to Scotland. Never off his guard, amongst his most anxious legislative provisions are those relating to the defence of the kingdom,—arming all able-bodied men, prohibiting exports of arms, fortifying the towns and castles on the borders, arranging signals to give notice of invasion. Though attacked by leprosy contracted in his campaigns, he remained active to the last,—a monarch such as occurs only once in many centuries, brave, liberal, wise, and pious, like the English Alfred, the darling of the nation he had delivered. (For fuller details, see ROBERT THE BRUCE, vol. xx p. 594 sq.)

David II

The wise provision that Bruce made for the regency secured the peaceful succession of his son David II (1329-70), who was the first Scottish king anointed at his coronation,—a privilege conceded to Bruce in a bull which reached Scotland after his death. According to the ideas of the age this placed the Scottish king on an equality with the sovereigns of Europe. The War of Independence quickened the sentiment of Scottish nationality, and left the country poorer in wealth but richer in spirit. The memories of Wallace and of Bruce educated the people and produced in the next generation the earliest literature of England, unconscious of the benefit, gained by its own defeat. But for the resistance of the Scots it might have become earlier than France a centralized feudal monarchy. The distinct character of the Scots—a blend of the Celt, Saxon, Norseman, and Norman—strengthened by variety the collective force of Britain. The loss which must be balanced against the gain was the bitter hatred between two races of kindred origin within one narrow isle, which for centuries retarded the progress of both, especially of the smaller kingdom.

The almost contemporaneous reigns of David II and Edward III reversed the position of the two countries: Scotland had now one of its feeblest and England one of its most powerful kings. Had not the love of liberty become the life-blood of both nobles and commons in Scotland it must have succumbed in the desperate struggle. After the death of Robert, Randolph, earl of Moray, governed with wisdom and vigour for three years. On his death the estates chose Donald, earl of Mar, another nephew of Bruce, whom he had passed over, foreseeing his incapacity. Encouraged by the divisions of the nobles, Edward, son of John Baliol, with the barons who had lost their land by espousing the English side, suddenly landed at Kinghorn. Nine days after his election, Mar was met and worsted by Baliol on Dupplin Muir (11th August 1332), where Mar himself and many nobles were slain. Baliol was crowned at Scone, but Perth was immediately retaken, and Baliol, having been defeated at Annan by the young earl of Moray, left Scotland. Next year Edward came with a large army to his support and defeated at Halidon Hill (20th July 1333), chiefly through the skill of the archers, the Scots led by Archibald Douglas, lord of Galloway, who was now regent. Berwick capitulated and Baliol surrendered it to England, pledging in addition the castles of the Lothians, including Edinburgh and Linlithgow, in security for an annual tribute of £2000. Like his grandfather, Edward III made a new ordinance for the government of Scotland, but his officers never obtained possession of their posts. Meantime David and his queen fled to France, where they remained seven years. Fortunately for Scotland a new race of patriotic leaders appeared. Moray of Bothwell handed down the

traditions of Wallace and Bruce, while Robert the Steward, 1328-1365 Douglas the knight of Liddesdale, and Sir Alexander Ramsay of Dalhousie sustained the fame of Bruce, Randolph, and Douglas. The attraction of a French campaign with the crown of France as prize prevented Edward from ever using his whole force against Scotland, and a French fleet made a diversion by attacking the Channel Islands and threatening the Isle of Wight. Edward retaliated by assuming the title of king of France, and after two years' preparation invaded that country from Flanders. The armies met at Vionfosse (26th September 1339), where David of Scotland was present. Never was the pomp of chivalry seen in greater splendour, but the first act of the Hundred Years' War, which seemed destined to make French and English eternal enemies and French and Scots perpetual allies, passed without a blow.

Two years later the recovery of the Scottish castles and David's the repulse of Salisbury's attempt on Dunbar made it safe for David to return to Scotland, which Baliol had abandoned. Though scarcely eighteen, he assumed the government (30th March 1342). Before his arrival Edinburgh had fallen, and next year Roxburgh was taken by Sir Alexander Ramsay, whom David unfortunately rewarded by the sheriffdom of Teviotdale, which the knight of Liddesdale claimed, and Ramsay, seized by treachery, was starved to death at the Heimtatte by the knight of Liddesdale, who entered into correspondence with the English king, and dishonoured his name of the "Flower of Chivalry." Bullock, an ecclesiastic who had risen to the office of chamberlain under Baliol and transferred his services to David, met the same fate at the hands of the king on a suspicion of treason. Other signs of weak government were not wanting. On the conclusion of a brief truce, David, tempted by Edward's absence, invaded England in spite of the detection of some of his chief nobles, and was defeated at Neville's Cross (17th October 1346) near Durham by the archbishop of York and the northern barons, the king and several of his nobles being taken prisoners. The rigour of David's captivity (which lasted eleven years) was relaxed so far as to allow him to return frequently to Scotland and try to persuade the people to raise his ransom, which the English king urgently required. Though Baliol was still acknowledged as nominal king by Edward, he resided in Galloway, while Robert the Steward, elected regent in the name of David, really governed. At length by the treaty of Newcastle (13th July 1354) David's ransom was agreed on, sufficient hostages being taken for its payment. Next year the French king resumed the Scottish war by sending Eugene de Garanciere with men, money, and arms. Several border engagements followed, but Edward, advancing to the frontier, took Berwick, and obtained from his puppet Baliol an absolute surrender of the Scottish kingdom for an annuity. He ravaged the Lothians in the raid called the Burnt Candlemas, but failed really to reduce the country. Edward's victory over the French at Poitiers, in which many Scots were slain, forced the Scottish parliament to grant the terms dictated by the English king. Peace was finally concluded by the treaty of Berwick (3d October 1357), and confirmed at Scone,—the ransom being raised and the condition as to hostages made more severe. David at once returned to Scotland. But his sympathies had become English; he revisited that country almost every year, and it required all the strength of the Scottish estates to prevent the son of Bruce from making a surrender of his kingdom more ignominious than Baliol's. The enormous ransom pressed hard on so poor a country. An attempt to induce France to resume the war failed, and David, like a debtor dealing with a money-lender, had to renew his bills at usury. Negotiations for this purpose

Struggle against Edward Baliol

Belshous with Edward III.

1365-1390 went on till 1365, when a truce for four years was agreed to Edward and David latterly devised schemes for payment by another process,—the transfer of the crown at David's death to an English prince. At the parliament of Stone David proposed that Lionel, duke of Clarence, should be recognized as his heir, but the estates lepled with one voice that no Englishman should rule Scotland, and renewed the settlement of the succession by Bruce on Robert the Steward. Hatred of foreign aggression and the weakness of the king enabled the Scottish barons to play a part similar to that taken by the nobles of England in the reigns of John and Henry III., and obtain guarantees for the constitution by limiting the monarchy. Such was probably the origin of the committees of parliament (at a later date turned to an opposite use) for legislation and for judicial business which first appear in 1367,—the statutes for the more regular administration of justice, purity of the coinage, and the revocation of the grants of royal revenues and estates. It was expressly declared that no attention was to be paid to the royal mandate when contrary to law. About this period David entered into a secret agreement with Edward, promising in return for a remission of the ransom to settle the crown on him failing heirs of his own body, but the public negotiations for its payment went on. In the same year his marriage with his second wife, Margaret Logie, a daughter of Drummond, a lesser baron, led to a revolt. He quelled it and threw the steward and at least one of his sons into prison, making lavish grants to Margaret and her relatives. Her influence did not last long, as she was supplanted in the king's favour by Agnes of Dunbar. Margaret was divorced by the Scottish bishops, for what cause is not known, and, though her appeal to the pope succeeded, David did not survive the decision. He died on 21st February 1370, childless, and the succession opened to Robert, son of Bruce's daughter Marjory, the first of the Stuarts who were to govern Scotland for the next two centuries.

6. *House of Stuart from Robert II. to James IV.*—The descent of the house of Stuart is traced from Walter Fitz-Alan, a Norman, steward of David I. His estates were in Renfrew, to which Alexander, the fourth steward, added Bute by marriage. Walter, the sixth steward, was scarcely one of the chief nobles, but his prowess in the War of Independence gained him the hand of the daughter of Bruce. Robert II. was their only son. Such was the prosperous record of the family before it ascended the throne. Its subsequent history presents a series of tragedies of which that of Mary Stuart is only one, though the most famous. While the fate of kings excites the imagination, history must trace the growth of the nation and the slow changes which transformed the bulk of the Scottish people from loyal subjects to bitter enemies of their native kings and its kings from patriots to tyrants.

Robert II. (1370-90), already fifty-four, continued rather than commenced his government on the death of David II., for he had been twice regent during David's exile and captivity. He did not ascend the throne without opposition, but the memory of Bruce was too fresh to admit of his settlement being put aside. The earl of Douglas, whose great estates on the border made him more formidable as a competitor than his claim by descent from a daughter of David, earl of Huntingdon, was conciliated by the marriage of the king's daughter Isabella to his son and by his own appointment as justiciar south of the Forth and warden of the eastern marches. This impediment removed, the coronation proceeded, and it was followed by a public declaration of the settlement of the crown on Robert's son John, earl of Carrick, at his father's death. A still more explicit settlement was made two years afterwards on the

king's sons by his first marriage with Elizabeth More,—John earl of Carrick, Robert earl of Fife, and Alexander, lord of Badenoch, and failing them on those of his second with Euphemia Ross,—David earl of Strathern and Walter his brother. A question as to the legitimacy of the children by Elizabeth More rendered this declaration necessary. The first fourteen years of Robert's reign passed with scarcely anything worthy of record. The king, whose portrait is drawn by Froissart as a man "not valiant, with red bleared eyes, who would rather lie still than ride," left the cares of government to his sons, especially the second. England, after the death of Edward III. (1377), was occupied with the necessary arrangements for a new reign and with the rising of Wat Tyler (1381). The absence of any movement in Scotland similar to this or the French Jacquerie perhaps indicates a better relation between the peasantry and the upper classes, but a third estate of the commons was as yet unknown in Scotland. John of Gaunt, who had invaded Scotland the year before, now took refuge there and was hospitably received in Edinburgh till the young Richard II., by putting down the rising, made it safe for him to return. This visit led to the first entrance into the northern kingdom of the principles of Wickliffe and the Lollards, whom Gaunt favoured. The French, still anxious to incite the Scots to attack England, sent a small party of free lances, who landed at Montrose and were allowed to make a raid on their own account. They were followed by John de Vienné with 1000 men-at-arms and many followers.¹ The licence of the French knights did not promote good feeling, but the interest of the two countries prevented a rupture. After the French left the Scots made another raid into Northumberland, in retaliation for an expedition in which Richard II. wasted the Lothians. Three years later, under the earl of Douglas, they attacked Newcastle, but were repulsed by Henry Percy, who, true to his name of Hotspur, in order to recover his pennon, pushed them to near Redesdale, about 20 miles from their own border, and fought the battle of Otterburn (1388). Douglas himself fell, but the victory went to the dead man, for young Percy and his brother were taken captive, and the bishop of Durham would not venture to intercept the retreat of the Scots. In 1388, Robert's inactivity increasing and his son the earl of Carrick being disabled by a kick from a horse, the earl of Fife was chosen regent by the estates under condition of annually accounting to them for his administration. In April 1390 his father died. His prosperous reign rather than any personal quality except an easy disposition gained Robert the praise of Wymont, who, writing under his son, prays God to give him grace.

"To govern and uphold the land
In na war state noi he it fand,
For quhen his fadyr dyed was
Of Scotland was na part of land
Out of Scottys menys hand,
Outwith Berwick, Roxburgh, and Jedburgh."

This prayer was only partially fulfilled. The English did not acquire more of Scotland, but the border war was not so successful, and the royal house was the scene of tragic events which threatened to change the order of succession.

Robert III. (1390-1406)—for under that name the earl Robert of Carrick was crowned to avoid the hated name of John III.

¹ Froissart gives a vivid account of the poverty of the country and the rudeness of its people. "The people set little upon the distinction of their houses and said shortly how with three or four poles they would make them again. Edinburgh, though the king kept there his chief residence and it is Paris in Scotland, is not like Tourmay or Valenciennes, for in all the town there are not 4000 houses." The man Vienné brought with him had to be lodged in Dunfermline, Kelso, Dalkeith, Dunbar. On his return he was asked by the young king Charles VI. how he fared, he said he had rather be count of Savoy or Artois than king of Scotland.

—was even less active than his father. He is briefly but truly described by an historian as a good man but not a good king. He scarcely reigned, for the regency of his brother continued after his accession till it was succeeded for a few years by that of Robert's son, on whose death the earl of Fife again became regent. There was a truce with England for nine years, during which the irrepressible love of fighting had to satisfy itself within Scotland. The king's younger brother, Alexander, called the Wolf of Badenoch, who had been created earl of Buchan, quarrelled with the bishop of Elgin and burnt his cathedral. The Wolf and his sons were constantly engaged in private wars. The earl died in 1394, but his son Alexander continued to defy the law, which the Government was too weak to enforce in the northern Highlands. Policy was used to suppress the violence of the clans. Such seems the explanation of the combat between thirty of the Clan Kay and as many of the Clan Chattan before the king on the North Inch of Perth, which ended in the slaughter of nearly all the combatants on both sides. In the council or parliament of 1398 a change was made in the Government due to the general distrust of Fife and the rising spirit of the earl of Carnick, the king's eldest son. The form of it was a compromise. The young prince was made lieutenant for three years, but with the advice of a council, of whom his uncle Fife was one, they were created dukes of Rothsay and Albany respectively the first of that title in Scotland. Other acts of this council were designed to restrain the monarchy by constitutional laws. Parliament was to meet annually. The king, if accused of misgovernment or breach of law, might, "to excuse his defaults," arraign his officers before the council. No one was to ride through the country with more followers than he could pay for. The grant of £11,000 for the common weal and profit of the kingdom by the three estates—barons, clergy, and burghs—was made under protest that it was not to be a precedent, and the burghs stipulated that in future they were not to pay more than under Robert II. In the following year the revolution took place in England which led to the deposition and death of Richard II and the accession of Henry IV. An impostor who had assumed the name of Richard took refuge in the Hebrides and was received at the Scottish court. The expedition of Henry to Scotland (1400), partly due to this, was also prompted by the desire to distinguish a new reign and by the invitation of the earl of March, indignant at the preference given to the daughter of Douglas over his own as wife for Rothsay. Reviving the old claim of feudal superiority, which was now supported by the forged charters of Hardyng as well as the fictions of Geoffrey of Monmouth, Henry cited Robert to do homage at Newcastle, and, on his failing to appear, marched to Edinburgh. Rothsay successfully defended the capital, and Henry was suddenly recalled by the rising of Owen Glendower and the Percies. Next year (1401) occurred the death of Rothsay by starvation at Falkland, where he had been committed by his father at Albany's instance on account of his bad government and dissolute conduct. The declaration of the council at Edinburgh, which acquitted Albany of all concern in the death, was enough for the moment, but in after times, like Bothwell's acquittal, a corroboration of guilt. The last years of Robert were clouded by private and public misfortune. His queen, Annabella Drummond, his son-in-law, the earl of Douglas, and Trail, bishop of St Andrews, one of the wisest of his council, died within a short interval. The son of Douglas, though brave, was unequal to the task of holding the border against the Percies and the earl of March, and so constantly lost battles that he was called Archibald Tyne-man. The Scots were signally defeated at Nisbet Mur

(14th September 1402) in Meise and at Homildon Hill 1390-1413 near Wooler by Percy, where the slain and prisoners equalled the number at Otterburn. Nor could order be maintained within Scotland itself, of which the forcible marriage of the countess of Mar by Alexander, a bastard of the Wolf of Badenoch, was an example. Aftand of Albany, and warned by the fate of Rothsay, Robert sent his remaining son James to France (1403), but the ship in which he sailed was taken by an English cruiser, and the future king was a prisoner in England for nineteen years. This last blow broke the weak heart of Robert, who died at Dundonald and was buried at Paisley. Though his reign was glorious, the tradition of the War of Independence still warmed the heart of the nation and produced the earliest writers in Scottish literature.—Barbour, Fordun, and Winton. The *Brue* of Barbour became the national epic.

The year after Robert's death the first martyr in Scotland, James Resby, an English priest, was burnt at Perth by Albany, who is described by Winton as "a constant Catholic." Resby was condemned at the instance of Laurence of Lindores, called the Inquisitor of Scotland, for forty theses from the books of Wickliffe. The Lollard doctrines continued to be secretly held by a small sect, chiefly in the west. Knox traces the descent of the first Scottish Reformers—the Lollards of Kyle—from Wickliffe and Hus. This religious movement was destined to exercise a profound influence on the history of Scotland. The time when the church was a civilizing and purifying power was passing away. Its enormous wealth, a contrast to its early poverty, its development so different from its primitive doctrine, celibacy, and the confessional in a lax society, that was no longer moved by the fervour of a new faith, produced a corruption which forced itself on minds of a reforming tendency. Catholicism allowed no place for individual reformers, and their protests, often carried to extremes, were deemed attacks upon the church itself, which became (unwillingly on the part of its best friends) the defender of its worst abuses. From first to last in Scotland the movement was popular, though not at first democratic. It did not at all or only to a slight extent change through political causes as in England.

Though he was a captive, the right of James I (1406-37) James I on his father's death was at once acknowledged by a general council held at Perth, but the appointment of Albany as governor boded ill for his return. He held the office Albany's thirteen years, administering it till his death so as to conciliate all classes and pave the way to his own accession to the throne, which would have been his by right had the young king died. The recovery of Jedburgh (1408), long in the hands of the English, gave the regent an easy opportunity of popularity. It was decided by a general council that its walls should be razed and the expense defrayed by a poll tax, but Albany refused to burden the people and paid it out of the royal customs. Next year Albany and Douglas (now released from captivity in England) entered into a bond of alliance. With the earls of March and Mar and others similar engagements were made; but Douglas, who had acquired the lands of March, which, however, were now restored, had to be conciliated by a grant of Lochmaben and Annandale, the patrimony of the Bruces. The more independent nobles of the north could not be so easily gained, and Donald, lord of the Isles, disappointed in a claim to the earldom of Ross, invaded Aberdeenshire with a great host, whose defeat by the earl of Mar at Harlaw (17th May 1412)—the Otterburn of northern ballads—was followed by the capture of Dingwall, his chief castle on the mainland, and his final defeat at Lochgighhead.

The first Scottish university—St Andrews—was founded by bulls granted a year later at the instance of James and

1413-1427] Bishop Wardlaw, who had been his tutor. The higher education had already been to some extent supplied by cathedral and monastic schools, but Scots who sought a complete curriculum had to resort to Oxford or Paris. One of their number, Major, expresses his wonder that the Scottish prelates had not earlier thought of a national university. That now founded was destined to play an important part in promoting the Reformation and along with the later universities in civilizing Scotland.

Little of note occurred during the remaining years of Albany's regency. His futile siege of Roxburgh (1415), soon abandoned, got the name of the Fools' Raid. Greater credit attended the Scottish arms in France, where the earls of Douglas, Buchan, and Wigton won battles for the French king, and lands and honour for themselves, but the defeats of Crévant and Verneuil effaced the honours of Beaugé (in Anjou), and, though the remnant of the Scots remained as the king's bodyguard, no considerable number of troops from Scotland afterwards went to France. Albany died at Stirling in his eightieth year (3d September 1419). His son Murdoch assumed the regency as if hereditary, but, himself indolent and with lawless sons, he did not retain the influence of his father. In 1423 ambassadors sent by the Scottish parliament to England at last arranged terms for the return of James from his long exile (12th May 1423).

Education of James I.

Exile had its uses, and, except at the beginning and again after the accession of Henry V, his captivity had not been rigorous. Sir John Pelham was his governor, and he was instructed in Latin grammar, oratory, and poetry, as well as in bodily exercises—wrestling and the use of the spear. Though distinguished for physical strength, his bent was to the Muses, and he became proficient in dancing, music, and poetry. Buchanan blames this taste as earned beyond what became a king, but nothing in his after life showed he was ever led by amusements to neglect graver studies. When thirty he was taken by Henry V to France with the view of detaching the Scottish allies of the dauphin, but refused to be made a tool of, saying he had as yet no kingdom and they owed him no allegiance. He proved his soldiership by the capture of Dreux. On his return to England he married (11th February 1423) Johanna Beaufort, daughter of the earl of Somerset and grand-daughter of John of Gaunt. In the *Kings Quhair* he describes his love at first sight in the language of his master Chaucer, but with original genius. The marriage facilitated his release, which was negotiated for a sum of 60,000 marks. He confirmed the treaty at Melrose and was crowned with his bride at Soane (21st May 1423) by Wardlaw,—Albany, as earl of Fife, placing him on the throne.

He lost no time in addressing himself to the task of restoring the royal authority and the obedience to the law which the long regency had weakened. From this time dates the conflict between the king and the nobles,—the latter not maintaining, as in England, constitutional rights, but contending for exorbitant privileges. The experiment of government without a king had been tried too long not to make those who had exercised unrestrained power desire its continuance. The nature of the country—divided by rivers, mountains, and arms of the sea—the absence of great cities and the number of strong castles, the close connexion of the principal nobles by marriage and bonds of alliance, the large jurisdiction within their territories, the clanishness not only in the Highlands and on the borders but in some measure throughout the whole country, which made fidelity to the chief a natural duty, strengthened the aristocracy and weakened the crown. The sovereign had to rely on the people and the clergy; on foreign alliances, on the influence due, partly to the virtues of his predecessors, partly

to the magic which in that age encircled the name of king. The first parliament of James at Perth passed quietly, but with indications of a policy long meditated and now to be put into operation. One Act forbade private James war, another imposed the penalty of forfeiture of life and the goods for rebellion, and a third directed an inquest by the sheriff what lands "pertain to the king or has pertained" in the time of the last three kings and in whose hands they now are. The choice of the privy council was significant. It was headed by Lauder, bishop of Glasgow, who had negotiated the king's release, but none of the greater nobles were included. In their stead appear an unusual number of minor gentry, some holding high offices. The parliament held at Perth in the following year was the scene of a *coup d'état* (12th March). Albany, his younger son Alexander, Alan of Otterburn his secretary, and Sir John Montgomery were seized on one day, and immediately after Isabella, Albany's wife, whose father, the earl of Lennox, had already been arrested. The only one of Albany's kin still at large, his youngest son James, made a short resistance, burnt Dumbarton, and slew the Red Stuart of Dundonald, the king's uncle, but, being hotly pursued, fled to Ireland. Parliament, at an adjourned sitting at Stirling, proceeded to the trial of Albany and his adherents, which was held with feudal solemnity before an assize. Albany, his two sons, and Lennox were condemned and executed on the Heading Hill. Clemency was shown to those who had not been his intimate supporters. Historians are divided as to the policy or necessity for such severity. But it secured its immediate object, it was felt that Scotland had again a king to defend his rights. James for twelve years carried out, not without murmur, but without successful opposition, his projects of reform.

Foreign states recognized his power. At the request James's of the Flemish estates Middelburg was restored as the foreign market for Scottish trade, in return the privileges of policy. The Scots were guaranteed and Flemish merchants undertook to raise part of James's ransom. Flemish artisans and manufactures settled in Scotland. More than one embassy passed to and from Rome with regard to the affairs of the Scottish Church, which James, while strictly repressing heresy (a Bohemian doctor, Crawar, being burnt as a disciple of Hus), showed his intention of reforming. The new pope Martin V. had put an end to the schism. The bitter enemy of the English king on account of the regulations which culminated in the Statute of Premunire, he welcomed James's advances. James, while showing his attachment to the church by founding a Carthusian monastery at Perth and a Franciscan in Edinburgh, asserted his right to remedy abuses of the ecclesiastical courts, and addressed a letter to the Benedictine and Augustinian monks reproaching them for laxity. To Erik of Norway he sent an embassy and obtained a commutation of the arrears due for the Hebrides under the treaty of Laigs. A marriage between the dauphin and Margaret, his infant daughter, previously arranged, was celebrated shortly before his death. He thus established friendly relations with the Continent, and, though his position as regards England could not be the same, the trace was only twice broken towards the end of his reign—by a raid of the English, who were defeated at Peferden (1425) by the earl of Angus, and his own attempt to recover Roxburgh. During the fourteen years of his actual reign James held thirteen parliaments, proving his desire to obtain the support of the nation in his reforms. In 1426 he introduced the session, a royal court for civil causes sitting in the principal towns, to provide the justice too often denied in the baronial courts. Next year he summoned a parliament to Inverness—an unusual

Subjugation of Highlands

place of meeting—for the purpose of restoring the peace of the Highlands. Its records are lost, but the chief event was the seizure of Alexander, earl of Ross, lord of the Isles, and his mother, along with as many as forty chiefs. Two were beheaded and a third hanged, but most of them, including the lord of the Isles, after a short imprisonment, were released. Ross at once raised the standard of rebellion and burnt Inverness, but was defeated by James at Lochaber, where the clans Chattan and Cameron deserted to the royal side. On the Sunday following the former killed in a church the whole of the latter clan who were present. Another internecine conflict took place in Cathness seven years afterwards. Such private feuds, traditional amongst the Celts, were one cause of the success of James and of the ultimate subjugation of the Highlands. So completely was the power of the lord of the Isles broken that he came as a suppliant and placed his sword in the king's hands at Holyrood. His life was spared, but he was confined to Tantallon castle. In a parliament held later in the same year at Perth an Act was passed for the representation of the shires and the election of a speaker, but this imitation of the English House of Commons was not acted on. The Scottish parliament continued to sit in one chamber of lords, clergy, and commons, and it was only in the reign of James V. that representation of the shires was admitted. The following parliament (1428) provided that an oath of fealty should be taken to the queen by all persons succeeding to lands or dignities, which shows that James knew the danger of his policy. In 1429 an Act was passed for the protection of the tillers of the ground, who were not to be removed for a year, and provision was made for arming all landowners and burgesses. The birth of twins—Alexander, who died young, and James, afterwards king—strengthened the king's position by interposing two lives besides his own against any attempt at revolution. Two years later Donald Balloch, a kinsman of the lord of the Isles, renewed the rebellion, but, though he defeated Mar and Cathness, on the approach of James himself he fled to Ireland.

Dealings with his nobles

In 1434 the king applied the statute of his first parliament as to the resumption of lands to which no sufficient title could be shown. The estates of the earl of March were forfeited on the ground that Albany had exceeded his power in restoring them. He was created earl of Buchan with the intention no doubt of removing him from the border and conciliating him for his loss. The death in 1435 of Alexander Stuart, earl of Mar, led to the lapse of that earldom to the crown on account of his bastardy, and the following year the earldom of Strathearn was resumed on the ground that it was a male fee and did not pass to the wife of Patrick Graham, the heiress-female. It was bestowed in life-rent on the king's uncle, the earl of Athole, and Malise, the son of Patrick Graham, was made earl of Menteith. This assertion of right on the part of the king to deal with the estates of the nobles though fortified by legal documents and recognized possession was certain to make enemies. It is more surprising that James so long succeeded in maintaining his authority than that he at last perished for doing so, but he had the people on his side. In the summer of 1436 he was obliged to relinquish the siege of Roxburgh owing to the barons' refusal of support. In October when the forfeiture of Strathearn was made in a parliament at Edinburgh, Sir Robert Graham, uncle and tutor of the young heir Malise, denounced the king in the boldest terms and urged the barons to seize his person; but, failing, he was banished from the court. As in other cases, this leniency was not required. In his Highland retreat Graham formed a conspiracy with Athole, the king's uncle, who aimed at the crown, and Sir Robert Stuart, Athole's grandson. James
